The discussion in the Italian Chamber of Deputies last week shows that even there the question of woman suffrage is heing taken seriously. In England the aggressive campaign of the suffragettes, while doing some harm to the cause, has indubitably attracted popular attention to the subject in a way probahly impossible by peaceful methods. To prove that the educated and professionally employed English women want the ballot, a petition has heen circulated among them with great success, the literary women leading in signing this appeal to Parliament. Now that there is a private hill before the House of Commons, the agitation is certain to reach a white heat before the sitting is over, and members of the House, who have heen so free in promising to support the cause at some distant date, will have to show their true colors. Campbell-Bannerman, too, must soon decide whether he will push the measure enthusiastically and send it to the House of Lords, or whether he will let it drift along. Probahly he is not anxious to do either, in view of the existing relations with the upper house.

There is a delightful inconsequence in a recent dispatch from Berlin, which speaks of the erection of wireless telegraph stations at nearly all the Moroccan ports by a French syndicate. As a result, we are told, British and German merchants fear that the wool trade and "the fluctuations of the silver currency" will pass under French control. Where the connection comes in it is rather hard to see, except in the sense that good communications corrupt a competitor's chances. It is true, nevertheless, that French commercial enterprise in Morocco is meeting with increasing success. The figures for the country's trade in 1905 show that, while Germany's share has remained stationary at about 13,000,000 francs and Great Britain's has experienced a decline of about 15 per cent. to 37,000,000 francs, France has forged ahead with a total trade of 43,000,000 francs. The increase is explained as due partly to the failure of the crops in 1904, which necessitated the importation of more food, coming chiefly from France and her colonies, but partly also to the influx of French settlers in the various ports. In Tangier the French colony numbers over a thousand. No less than eleven lines of steamships connect the Moroccan ports with Algeria or Marseilles.

HARRIMAN'S REWARD.

The Harriman inquiry is "ended," announce the newspapers. But in Wall Street and banking circles the question which is being soberly asked is whether Harriman himself is not ended. This does not mean that his continuing power, through the control of great wealth, is in doubt. He has his millions, and may go smother himself in them. But it is gravely doubted whether his days as an active and open manipulator of railroad securities are not drawing to a close. What enterprise with which his name might hereafter be connected would not be, from the beginning, violently suspect? What directorate would in the future think to gain public confidence, or to draw investments, by displaying E. H. Harriman among its members? Visions of looting, of secret self-voted dividends, of stock-jobbing, of properties squeezed dry by its guardians, would at once rise before every man who saw that name, and could read, and had a memory and common prudence. It is considerations of this order which are shaping the financial opinion that Harriman is "through."

We do not profess to know anything about this. Mr. Harriman may or may not conclude to "retire." That step, after all, would not greatly signify. The certain and salutary thing is that Mr. Harriman has verily received his reward. He went for millions, and he has got them. He cared not for the contempt of decent people, and he has got that. In his own person he illustrates to-day, on a scale visible across the land, the infallible working of the moral law as laid down, for example, in Emerson's essay on "Compensation." "The swindler swindles himself." He who admits no moral standard but "the base estimate of the market," will find himself in the end regarded, not as a real man, but as a baled article for sale.

In this sort of moral atmosphere which certain men, in their mad, unscrupulous pursuit of great riches, unconsciously create about themselves, there exists a punishment more fearful than any which could be devised by statute. Its victim spends busy years with no thought except how to heap up money by craft and trick and oppression. He is meanwhile surrounded by toadies and exploiters who fill his narrow field of vision, and keep him unaware of the verdict which the large community of moral people is all the while preparing to pronounce upon him. Too late, he wakes to what he has done. He has chosen great riches rather than a good name. But his wealth can neither hide nor alter the opinion of his fellow-men, which is thrust upon him in ways that he cannot escape. He discovers that he is friendless—save for those who fawn upon him for their own ends. His attempts to rehabilitate himself by large gifts to education, to charity, or religion are unavailing. The judgment has been passed upon him, and can be changed by nothing which he may do. He is increasingly shunned, hated, despised. It is into this sort of moral penumbra that Mr. Harriman now enters, with his booty clutched to his heart.

We have nothing whatever against him personally; but we can only consider the fate which has overtaken him to be most exemplary. He thought that the people upon whom he was preying were defenceless. He boasted that he had gone only "so far as the law allowed him." Perhaps he is right in thinking that he has nothing to dread from courts and juries. But there is something more formidable and crushing than a legal process. It is the deliberately formed opinion of 80,000,000 of people that a man's wealth is ill-gotten, because his methods have been dishonorable and heartless. Against that, what can uncounted millions do?

In another way, we hope, the moral demonstration made by Mr. Harriman's reward will do good. It should serve as a warning to those who come after him in the management of the great railroad systems. The law defines such common carriers as being "affected by a public interest." The Harriman plan has been to allow nothing but private interest in them. To seize every penny possible, to omit no occasion to make greed disgusting by even voting himself $100,000 for his eminent services in overburdening the road he had "reorganized," to grab all the cash in the till before leaving—that has been, in effect, the method of railroad management unfolded last week at the investigation by the Interstate Commerce Commission. But is this thing to go on? May we not hope for a generation of railroad managers who will put the public interest first? No one objects to a reasonable, even a large, compensation for their skilled services. High talent should be highly paid. But such a swinish attitude as Harriman's should be hereafter tabooed, not alone on moral grounds, but for business considerations. For nothing is more certain than that, if the railroad business should be generally conducted on the good old Harriman plan, there would soon be no private railroad business to conduct.

THE WORK OF CONGRESS.

The Fifty-ninth Congress, just adjourned, has in three particulars broken all records. It had a larger Republican majority in both House and Senate than any of its predecessors since the Reconstruction period; it appropriated more money, $1,800,131,984.95 in all; and it talked more, filling over 17,000 pages of the *Congressional Record* with its verbal output. Beyond these manifest distinctions, there is room for differences of opinion as wide as those which annually exist between Democrats and Republicans with regard to the state of the Treasury twelve months ahead.

That Congress could keep up for another year the pace set at the session which gave the country, one after another, the railroad rate law, the meat inspection law, the pure food law, free alcohol, Statehood for Oklahoma, and other conspicuous and meritorious measures, was not to be expected. It is at least worth remark that, after being "very, very good" for a year, the National Legislature should have passed so promptly the largest of all River and Harbor bills, provided service pensions for all veterans over sixty-two, and raised the salaries of its own members 25 per cent. Congress did, in fact, trade a little on its well-earned reputation of the year before. Yet the prophecies of a complete reaction against reform legislation have not been justified. The subsidy bill, it is true, received its *coup de grâce* only an hour before the session closed. But it was a very little and a dwindling subsidy at best. A big or comprehensive subsidy scheme would never have stood a chance. As it is, the subsidy grabbers will have to begin again their attempts to drive an entering wedge.

On the constructive side, the second session alone of this Congress leaves a record substantially equal to that of all three sessions of the Fifty-e'ghth. It has prohibited the contributions of national banks and of corporations to campaign funds, given the Government a limited right of appeal in criminal cases, extended to farmers the privilege of making free denatured alcohol, and limited to sixteen the number of consecutive hours that any railroad employee may be on duty continuously. More or less valuable legislation was passed relating to immigration (though with the Japanese proviso appended), to citizenship, and to the currency. Official inquiries on immigration, the labor of women and children, and the postal deficit were provided for.

One subject heads to-day every list of measures passed on to future Congresses. That is the revision of the tariff. "To a Republican Congress and a Republican President this great question can be safely intrusted," said the last national Republican platform. Yet we may well wonder how many of the citizens who voted for Roosevelt in 1904 would have believed that the Republican Congress which came into office through this former free-trader's popularity, could have finished its two years' labors without so much as a hearing on the readjustment of a ten-year-old tariff law, and without a single admonition from a White House ringing with ad-

monitions on a dozen other subjects.

It is a paradox that a Congress which has given so much of its time to grudging acquiescence in popular demands, which is commonly judged, in fact, according to the extent to which it has or has not followed President Roosevelt's various recommendations, should at the same time have done so much to make itself master in its own field. For several years there has been a quiet contest in progress between Congress and the departments. The latter were asking for amounts that Congress thought extravagant, and then, when the money was denied, spending it just the same and coming in a year later with deficiencies which practically could not be repudiated. One Committee on Appropriations after another has wrestled with the difficulty. One plan after another has been tried with small success. Last year Mr. Tawney drafted a new proviso. Heads of departments were required to apportion in advance the money allowed them. This allotment could not be changed except for some exceptional and unexpected happening. The Tawney amendment required the department head in writing to submit his reasons to Congress before authorizing any such change. The result is that, while there are large deficiency items for Cuban intervention, pensions, and the postal service, "coercive deficiencies" incurred in the departments are this year only two and one-half millions, as against thirty-three millions for the year before. Congress seems to have won its fight in essentials, even without fulfilling its threat of lopping off some bureaus entirely. In this assertion of Congressional power lies the best answer to those who think they see this country on the straight road to a despotism.

THE LONDON ELECTION.

So great a political overturn as that wrought by the elections to the London County Council on Saturday, was not expected even by those who ardently desired it. That the Progressives, with their policies of municipal trading, would meet with a check, was pretty confidently counted upon; but no one foresaw that they would be so nearly crushed and, even with the aid of their hold-over members, would lose control of the Council. In the last Council they had 83 members to 34 of the Moderates. Now the figures are practically reversed. The Moderates, or Reformers (they have various names), have elected 79 members, while the Progressives save only 36. This result is one of capital and far-reaching importance. It affects not merely the administration of London, but will have serious political consequences throughout the kingdom. Indeed, it will have its influence throughout the English-speaking world.

The Liberals had tied up their fortunes with the London Progressives. Hence the great defeat will be taken as a solemn warning to the party in power. The Conservative press is already saying that, if there were now to be a general election, the Liberals would lose all the seats which they so unexpectedly gained in London last year. Doubtless there is truth in the prediction. The Government will be more on its guard hereafter. Radical legislation will not be so much in favor, for a time at least. The talk of moving vigorously against the House of Lords will probably die down. No prudent Ministry could ignore the ominous significance of so marked a revolt of the electors as that just effected in London.

Through all the issues of the election there ran one dominant charge—municipal Socialism, as practised in London, was proving terribly expensive. There were minor allegations: Inefficiency and waste were charged, and in some cases proved. Several freak experiments, with their ludicrous failures, brought the Progressives into discredit. They tried to make bricks municipally, and turned out an unusable product. Their Works Department became a synonym for faulty and costly engineering, and unduly expensive construction. Then, too, they ran into absurd extremes. Some of them put out a programme which included "municipal workshops, stores, milk and bread shops, dairy farms; free travelling for workmen to and from work, municipal coal stores and collieries; municipal farm colonies and municipal clothing factories." One bold man stood on a platform calling for municipal billiard-rooms. Such extravagant proposals, as even the *Chronicle*, a Progressive organ, admits, "did immense harm to the Progressive cause." But above and beyond all such questions of theoretic policy stood the practical fact that the financial burden of all this municipal experimenting was becoming greater than the backs of the taxpayers could bear.

A good concrete example was offered by the Council's fleet of steamboats on the Thames. They have proved nearly a dead loss. This was in spite of glowing prophecies to the contrary. No less an authority than Sir E. Cornwall, in his report on the project to the Council, stated that the steamboats would bring in a revenue of $450,000 a year. For the first nine months they lost $256,000, and the estimated deficit for 1906-7 is $260,000 more—all this on a capital outlay of $1,500,000. It was not strange that debts and taxes mounted. The French economist, Leroy Beaulieu, has commented on the extraordinary increase of local indebtedness in England. London's debt has climbed up portentously; and with it the rates have gone soaring. A table worked out by the borough treasurer of Islington, and printed in R. P. Porter's recent book on "The Dangers of Municipal Ownership," shows a startling rate of taxation. It runs, in the various boroughs, from 30 to 60 per cent. of the rental value.

This was undoubtedly the aspect of the matter which had most to do with causing the Progressive upset. John Bull's pocket-nerve was at last reached. All the Socialistic theories he did not bother his head about; but when he found that their execution was turning out fearfully extravagant and burdensome, he said angrily: "This has gone too far!" Now that, be it remembered, is the Anglo-Saxon way. We are naturally weak on logic, and hate with Burke to see it carried into politics. The French fashion of laying down abstract principles and then rigorously deducing and applying every political inference from them, is not for us. We go by rule of thumb. We try one experiment here, and another there, approving the one that succeeds, scouting the one that fails, and never admitting the necessity of connecting them all by one logical system, rigidly enforced. It is because London Socialism had become too doctrinaire for English stomachs that it was rejected on Saturday. But this does not mean that a doctrinaire individualism will be set up in its stead. Englishmen and Americans will go on much as before in all this business, not accepting a general "policy," coherent and logical, but simply, in the old inherited way of our politics, proving all things and holding fast that which is good.

THE THREATENED ANGLO-SAXON.

The Registrar-General's report on births, deaths, and marriages in England and Wales for the year 1905 has just appeared. It will disturb those Greater Englishmen who find this kind of reading a subject for thought—and alarm. The marriage and birth rates are continuing to fall, and whatever the amount of improvement on the other side of the ledger—the rate of mortality has been reduced to an unprecedentedly low level—it cannot make up for the slackening tide of reproduction, if Great Britain is to continue populating her colonies with younger sons and to hold her own against prolific Germany. The latest figures, duly corrected, show that during the last thirty-five years the decline in the marriage rate "is found to be nearly 22 per cent.," the manufacturing centres showing the greatest decline, the residential and agricultural counties the least. The general rate for the year was 15.3 persons married per 1,000 of the population of all ages.

The births for the same year "were in the proportion of 27.2 per 1,000 of the population of both sexes and all ages, and not only constitute the lowest

birth-rate since civil registration was established, but also indicate tho continuance of a decline which, with trifling exceptions, has been in progress ever since 1876." How rapidly the country has been deteriorating in this respect is indicated by the fact that in 1880-82 it was seventh from the end among the European nations in female fertility, and that twenty years later it had come to be only second from the end, losing last place only to France. If the ratio of births to the number of married women "had been identical in 1870-72 and in 1905, the legitimate births in the last-named year would have been nearly 1,169,000 instead of the 891,978 actually recorded."

In this connection it is interesting to turn to a recent study of racial growth and dispersion by René Gonnard of the faculty of law at the University of Lyons, published under the title 'L'Émigration européenne au XIXe Siècle." In the chapters dealing with British emigration and with the future of "the Anglo-Saxon races," we find a straightforward thesis advanced and ably argued. Great Britain during the greater part of the nineteenth century was practically the only Power with a surplus population and colonies into which to drain it off. There arose in consequence lesser Britains beyond the seas, with a population predominantly Anglo-Saxon, including, under these lesser Britains, the United States. But the situation has changed; Great Britain's teeming growth is declining, while other European nations, Scandinavia, Austria-Hungary, Italy, and Russia, have been pouring a veritable flood of emigration into the United States and Canada, and would turn to Australia and New Zealand if admission to Britain's southern hemisphere were not so jealously guarded.

The conclusion of Professor Gonnard is that, with all due allowance for the admirable part played by the Anglo-Saxons in the colonization of such parts of the world as are destined to remain under the permanent domination of the "whites," and conceding to the aforesaid Anglo-Saxons a "brilliant and lasting future," there is danger of exaggerating the measure of the work they have accomplished or of the sovereign rôle destiny holds in reserve for them:

> Great difficulties lie in the way of realizing the dreams of British hotheads, nurtured by Rudyard Kipling's books and Mr. Chamberlain's speeches. Not all portions of the globe where now floats the Union Jack are fated to remain the patrimony of England and of her sons—at least in the racial sense. And among the reasons upon which we base our belief are two incontestable facts—the decline in Anglo-Saxon reproductivity all over the world, and the increased participation of other nations in the movement of European emigration.

We may leave out of the question these United States, seeing that the writer has conceded us a long and brilliant future as Anglo-Saxons, and has been careful enough to distinguish between predominance in numbers, where his case is naturally strongest, and predominance in the way of political and social influence. By implication he recognizes that Magna Charta and the language of Shakespeare are safe for years to come against any number of immigrants from the east and south of Europe, and that so far as these late arrivals are concerned, they threaten no immediate dilution of the Teutonic blood. And as for the more distant future, the chances are that the newcomer will turn out more royalist than the king. Have we not been told by no less a pragmatic historian than Mr. Dooley of an Anglo-Saxon Hands Across the Sea Association, organized by Schwarzmeister, Kelly, and Rosenblum?

But with regard to the newer Britains in South Africa and Oceania, the writer undoubtedly sees the future clearly. In South Africa, the English must share their power with the Dutch, not only in the older colonies, but in the Transvaal, where the recent elections have shown that Anglo-Saxon dominance is not to be thought of. English colonists are reluctant to settle in the territory of the late Boer republics, years of effort and the expenditure of vast sums having resulted in the planting only of 1,500 English families. In Australia a thin red line of settlers holds a continent jealously against all comers; and the situation is even more striking in New Zealand, where less than 800,000 people occupy a country capable of supporting, the writer cleverly remarks, dozens of millions of Japanese. If the yellow races should begin to press hard, would not the handful of proud Anglo-Saxons be glad to have on their own side some additional millions of non-British Europeans? In fact, there are not wanting signs that Australia is beginning to see the problem in that light.

TEMPORARY LITERATURE.

In *Scribner's Magazine*, Prof. Brander Matthews discourses on the differences between imagination and invention in literature. The subject in itself is not absolutely novel, and most of his distinctions have been drawn before; but it is refreshing to be reminded now and then that the law thundered from our magazine and newspaper Sinais, "Thou shalt be original; thou shalt look only for beats and scoops; thou shalt hit 'em hard," is, after all, but a partial and temporary revelation. The great masters, as Professor Matthews reminds us, never gave themselves to hunting up strange forms, dialects, or situations in order to create a desired effect. Fully equipped with the quality of imagination, they could animate old forms and adapt to their uses the ordinary grammatical constructions. They had so much to say that was permanent and essential that they could afford to dispense with originality.

It is, of course, the element of imagination that vivifies the comparatively small stock of the world's books which come to constitute the permanent furniture of a man's library, the pure domestic circle to which he returns inevitably, no matter after how long a period of indulgence in less worthy things. Homer and Horace, Shakespeare and Montaigne, the Bible and the Pilgrim's Progress—we rarely think of them as "original," as endowed with the attractive and extremely marketable quality of invention. For that we look elsewhere. But though that elsewhere may come to embrace nine-tenths of our total book list, it never threatens the security of the chosen few. These, like the gods, can abide in patience for our human moment of crisis, of mental exaltation. Then with Olympian assurance they come into their own again. With the results of man's daily actions and the faces of his offspring, they constitute the links that bind him to his past, that give him what psychologists nowadays declare to be the only basis of the personal soul—continuity.

The Bible and Bunyan, with Shakespeare probably, are still to be found in most simple rural homes. But what shall be said of the ordinary urban reader's stock of permanent, imaginative literature? Monumental sets of Balzac, of Dickens, and of Thackeray are sold in enormous quantities, but the array of volumes is so formidable, and the red and gilt binding so very good, that they are seldom taken out of their glass-enshrined, adjustable book-sections. A Balzac, a Library of the World's Nicest Literature, and a set of Lives of Great Men and Their Unhappy Wives take up as much room in a parlor as a mechanical piano at one-fifth the cost. The average New Yorker would no more think of using one of his gorgeous volumes than a bibliophile would one of his. For reading, of course, there are the newspaper, and the popular magazine.

There invention runs riot. But profound melancholy must be aroused by the sight of so many hundreds of thousands of us given over to pages which follow each other slap-dash day after day, leaving no impress and no memory behind them. Ask one of these readers what was it he had read a week ago, a month ago, a year ago, in his Sunday Supplement, and he cannot tell you. It may have been a double-page account of a "scientific" case of resurrection, or a printed rivulet of Congo atrocities with a pyramid of skulls on one side and royalty patronizing the stage behind the scenes on the other; but he cannot tell

with any certainty. And thus with his art; years ago it was the Yellow Kid; then came the French Twins of Etiquette; then it was the Felicitous Vagrant. They came with a rush, they lingered, they disappeared. Where are the jokes of yesterday? The *Latest* has thrown them all away and put up a brand-new set, yet none of its readers can say, "I am depressed to-night; I will look at the page that made me laugh so, a year ago." There is no year ago; there is no past. There is mist only.

Even the language changes—language which we have been accustomed to think of as being best preserved in the speech of the humbler classes. The expert on slang of to-day will not necessarily understand the slang of last year. Last year's "main guy" is now "the big noise." The man who formerly "shot off his mouth," later began to "talk through his hat," and at present usually "hires a hall." Fickle woman, who once gave unfortunate man "the cold mitt" or "the marble heart," now "hands him a lemon." Thus the old order changeth, and ten years from now a copy of the Comic Supplement will contain as many unfathomable allusions as a comedy of Aristophanes.

One source of consolation, however, is undeniably present. Beneath this mad rush of invention, we can discern, if we look, the persistence of certain universal principles and ideas. The individual of the Comic Supplement is transient, but the type is eternal. Mr. Opper's weazened Common People and giant Trusts are but a replica of the mediæval Dances of Death, with man as the victim of his own vices. The boastful ape whose end is always discomfiture, is an embodiment of Pride going before Destruction. The two clerks, striving to enter society on $9.50 a week, personify the tragedy of Ambition. There is an authentic story of the little girl who was moved to tears by the martyrdom of St. Stephen. "Why, mamma," she half sobbed, "he must have been like Happy Hooligan."

STEADY COMPANY.

It is strange that the institution known as "steady company" should never have been adopted by our fashionable society. One may either keep or be steady company; the term denotes both a process and a person. The adjective "steady" is not opposed to unsteady or dissipated; it means permanent as distinguished from transitory and fickle. Steady company may be of either sex, but is usually masculine, being predicated of the young man who is the chosen friend of a young woman, though not necessarily engaged to marry her. In the eastern districts of our borough, parents approve of steady company. The girl goes with him to church, the play, concerts, dances, Coney Island, ward picnics, and Sunday-school festivals—*sibi conscia recti*—and without a chaperon. If he is supplanted by some one even steadier than himself, he accepts the inevitable, and forever after holds his peace.

Hitherto little countenance has been given to steady company by the plutocratic and austere society which sets the example and the pace of fashion. But convention rather than any deep-seated moral principle has stood in the way. For the line which divides what is allowed and what is forbidden cannot be easily drawn. In the fashionable world, for a girl to be gone all day with a man in an automobile is allowed; to eat with him at a wayside inn is forbidden. To be driven by him in a stanhope, dog-cart, or other two-wheeled vehicle is allowed; to sit beside him and be driven by a coachman is forbidden. To write freely to him and be written to is allowed; to walk with him in the street after the lamps are lighted is forbidden. He may go with her to church or to a lecture hall without a chaperon, but not to the play.

Steadiness is not characteristic of the more fashionable "company." And this may explain why mothers lament the scarcity of marriageable young men. If they are obliged to work, they have little opportunity of knowing any young woman well. This evil state of things is especially noticeable at the season of the year when the débutante is abroad in the land. We hear that she is better educated than the average young man of her age, but under the social conditions which prevail at present, as soon as she is "brought out" she begins inevitably an intellectual *dégringolade*. For the men whom she meets at dinners and dances would not understand her or would laugh at her if she allowed traces of superior intelligence to be seen. They would prefer to talk about themselves and their own doings, and have in her a sympathetic listener. Indeed, a dinner or a ball is not favorable to forming permanent friendships, nor do such entertainments encourage matrimony. Calls may be made at tea-time, but busy men are at their work at five o'clock, and even if they were not, they might not find the young women alone. In days when men put on swallowtail coats and made their visits in the evening, greater intimacy was possible, and the young people knew one another better. Even now in certain provincial regions this custom prevails. In vain do the young men of the metropolis increase the frequency of their afternoon visits; in vain is their zeal to wander forth on Sundays, in unaccustomed garb, to snatch if possible a happy moment in the street or by the fireside. Each of them, if he but knew it, has a deeply implanted desire to be steady company. A blind instinct impels him *tot adire labores*.

If the social pacemakers would only do something to encourage steady company, good effects would undoubtedly follow. For example, the chaperon would have a much needed rest. By this time she must be weary of being tolerated, of talking to the odd man, and of watching scenes in which she has no active part. Steady company, instead of having to look up a chaperon and invite a lot of people whom he does not care to see, can dine *tête-à-tête* at a restaurant, and thereby save both time and money. In such ways young people get really to know one another; and if the custom were only universal, clubs would be left to the old and to the misogynists, while places of amusement would be even more freely patronized than they are now. Yet our "upper circles," with their highly developed sense of morality and propriety, will no doubt refuse to consider the reforms which we have suggested, and steady company will be left as the solace and joy of what is known as the "lower middle class."

WENDELL PHILLIPS GARRISON.

Wendell Phillips Garrison, who for forty-one years was editor of the *Nation*, died at Dr. Runyon's sanitarium, South Orange, N. J., on the evening of February 27, after several months of declining health. Mr. Garrison, third son of William Lloyd Garrison, the Abolitionist, was born in Cambridgeport, Mass., June 4, 1840; he passed an eventful boyhood in the paternal home, which was drawn into the agitation of the anti-slavery struggle and the events leading up to the Civil War. Entering Harvard in 1857, Mr. Garrison was graduated in 1861. After two years of private teaching, he joined the staff of the New York *Independent* in January, 1864; and in July, 1865, he became associated with Edwin Lawrence Godkin in founding the *Nation*. Mr. Garrison's work was chiefly on the literary side of the new weekly, Mr. Godkin devoting himself more and more to editorial writing. It thus fell to Mr. Garrison to draw together the staff of reviewers and contributors. With many of these his relations became those of warm personal friendship. This fact was clearly evidenced on July 6, 1905, when more than two hundred of the *Nation's* contributors presented him with a silver vase, inscribed by Prof. Goldwin Smith as a recognition of "forty years of able, upright, and truly patriotic work in the editorship of the *Nation*." The accompanying congratulatory note assured Mr. Garrison that he had made "the *Nation* for more than a generation the chief literary journal in America—the medium of the best criticism, and the mouthpiece of high intellectual ideals." During that long period there were very few issues of the *Nation* which he did not personally make up and see through the press, reading all the proofs, preparing the full and elaborate index to each volume, and doing a vast amount of editorial labor. He also reviewed many books, particularly those relating to slavery and to the lives and works of Jean

Jacques Rousseau and Erasmus. A review from his pen of the latest book on Rousseau appeared in the *Nation* of December 27, 1906, and one on the letters of Erasmus in the issue of January 24.

For the first sixteen years, the *Nation* was an independent property. In 1881 it was combined with the New York *Evening Post* by the late Henry Villard, Mr. Garrison's brother-in-law. Mr. Godkin became one of the editors of the *Evening Post*, and within two years editor-in-chief. Under the new arrangement, Mr. Garrison became literary editor of the *Evening Post* and editor-in-charge of the *Nation*. This position he held until his retirement on June 28, 1906, because of the rapid failure of his health.

Mr. Garrison's editorial duties confined him so closely to his office—he took only one real vacation in twenty-two years—that he had little leisure for other literary work. But in the "Life of William Lloyd Garrison," an elaborate four-volume biography, in which he and his brother, Francis Jackson Garrison, collaborated, he has left a record of his father's activity in behalf of the emancipation of the slave and many other reforms, which must remain a standard authority on the Abolition movement. To this task Mr. Garrison devoted his spare hours during ten years, setting apart at least one day each week for research and writing, and producing a work that is notable for its wealth of citations, its exact references, its fairness and candor, and the literary skill with which history and biography are combined. The first two volumes appeared in 1885, and the others in 1889. Previous to this undertaking, Mr. Garrison published "What Mr. Darwin Saw on His Voyage Around the World," 1879, containing extracts from Mr. Darwin's own story, intended for youthful readers. He compiled a collection of "Bedside Poetry," 1887, for the instruction of children; wrote "Parables for School and Home," 1897, and "The New Gulliver," 1898; published some of his own verse privately under the title "Sonnets and Lyrics of the Ever-Womanly," 1898; and edited the "Memoirs of Henry Villard," 1904. As an appreciation of his services to literature and politics, Harvard University bestowed upon Mr. Garrison the honorary degree of A.M. in 1895.

Mr. Garrison had lived since 1866 at Llewellyn Park, Orange, N. J. He served for more than seventeen years on the School Board of West Orange, and was for years a member of the board of directors of the State Geological Survey of New Jersey. He was twice married, first to Lucy McKim of Philadelphia, daughter of J. Miller McKim, one of the founders of the American Anti-Slavery Society, and sister of Charles F. McKim, the architect. His second wife was Mrs. Anne McKim Dennis, who died in 1893. He is survived by a son and daughter, Philip McKim Garrison of Orange, N. J., and Mrs. Charles Dyer Norton of Lake Forest, Ill. Another son, Lloyd McKim Garrison, died in 1900.

Self-effacement was so the law of Mr. Garrison's being that, even now when his lips can no longer frame a protest, one hesitates to essay his praise. It was his life-long joy to sink himself in his work. For forty-one years editor of the *Nation*, he seldom put his name to anything he wrote in its columns. If he had been an artist, it would have been his preference to leave all his paintings unsigned. To the discerning, however, his true monument is visible in those eighty-two volumes of the *Nation* which passed under his vigilant eye and amending pen, and into which he poured, in all of Milton's meaning, the precious life-blood of a master-spirit.

Uneventful outwardly, Mr. Garrison's life was yet singularly intense. It was intense in an austere idealism, ever conscious of the obligation of his name; intense in devotion to the labor which was his delight; intense in the discharge of every duty as a citizen and in the unwavering fidelity and unselfish services of friendship. His close association for thirty-seven years with Mr. Godkin was one of the most remarkable editorial relations that ever existed. With unbounded admiration and loyalty for his chief, Mr. Garrison brought to his assistance a nice scholarship, a patient scrutiny, a calm judgment, and a noble sympathy. When Mr. Garrison received, in 1905, the impressive tribute from his eminent list of contributors to the *Nation*, in celebration of his forty years with this journal, his first instinct was to pass on the laurel to Mr. Godkin. He spoke of himself as but a pupil of that "great writer and master political moralist, whom with admiring eyes I saw

Mount in his glorious course on competent wing."

Nor was Mr. Godkin unaware of the rare qualities of his colleague. Writing to Mr. Garrison in 1883, he said: "If anything goes wrong with you, I will retire into a monastery. You are the one steady and constant man I have ever had to do with." And he set great store by Mr. Garrison's disciplined opinions on public affairs. Thus he wrote to him in 1891:

> Your article makes me regret for the hundredth time that you have not been able all these years to write more. I know no better political philosopher. I can safely say that, in twenty-five years of perils by land and sea, there is nobody from whose advice and arguments I have got so much comfort and courage.

Yet Mr. Garrison's invincible modesty would not suffer such acknowledgments to go without abatement. "On cool reflection," he once wrote, "I am conscious how slight Mr. Godkin's debt to me is in comparison with mine to him. . . . Oftener than not, in doubtful cases when appeal has been made to my judgment, I have simply confirmed his first impulse or his phraseology. Perhaps my sympathy and support, understood rather than expressed, have been more to him than I suspected."

Between Mr. Garrison and the large corps of *Nation* reviewers and writers which he built up there existed a peculiar, almost a family, feeling. He watched over them with an interest and pride wellnigh of kinship. The relation was, to him, less editorial than fraternal. There must be thousands of his letters, written out in that beautiful hand of his, and with his marvellous felicity and justness of expression, still in the possession of his contributors as a witness to his high conception of the tie that bound him to them. No one could surpass him in discriminating encouragement. Even in his later years he kept a young heart and a keen eye for rising writers. He thought of his band of workers as one continually to be renewed by the influx of youth; and if youth brought, at first, immaturity and awkwardness, none so patient and tactful as Mr. Garrison in bearing with it and correcting it. Critical severity he could convey with the most exquisite delicacy—wreathing it in the garlands of friendship.

To be, rather than to produce, was always the first motive with Mr. Garrison. To him life was more than books. And how high he pitched his life, every man who was ever long in touch with his grave courtesy, his unfailing kindness, his unbending integrity, and his lofty ideals, would enthusiastically testify. To be in contact with him even in a newspaper office was to have one's admiration for him kindled and continually heightened; while those admitted to the intimacies of his friendship cannot find words to do justice to his faithfulness and self-sacrificing ardor in bestowing a favor or anticipating a need.

Mr. Garrison impressed all who knew him as a man of the well-fibred virtues of an elder day. He nourished himself on inward and hidden strength. One felt that his soul dwelt apart, yet one saw him cheerfully laying the lowliest duties upon himself. In the total combination of nearly ascetic sternness with himself and infinite consideration for others, we shall not soon look upon his like again.

One of the two surviving signers of the first prospectus of the *Nation* is President Gilman, who writes as follows:

For more than forty years we were correspondents, and through his letters, as well as through the *Nation*, I came to know him well, although, as it happened, we met one another very seldom—not more than three or four times, I should think, in that long period.

I formed a very high estimate not only of his intellectual character and his business habits, but of his moral qualities. He was considerate, true, fearless, and enamoured of justice (though I am not sure that he always saw both sides of a question). In a long series of his letters on innumerable topics there is but one note, rarely, if ever, expressed, but always implied, and that is the desire to have the *Nation* stand every week as the supporter of the best in literature as in politics. Toward the end of his editorial career, unwonted sadness is manifest. "My resolution [to retire]," he says in March, 1906, "was determined by my conviction that a long vacation this summer was imperatively necessary to my health. I shall remain at the helm until the close of the current volume. Then to fresh woods and pastures new. I shall take a year if need be to decide upon my future occupation."

I feel sure that his resolution in upholding the best standards of literary criticism, even to the extent of giving personal tribulation to friends that he valued, made him as great a power in the field of letters as Mr. Godkin in the field of politics; and I am likewise certain that his wide acquaintance with the various departments of scholarship, his efficient and long continued services in the editorial chair, his learning, his honesty, his sympathy, and his persistence entitle him to, and will undoubtedly secure for him, the lasting and hearty ap-

preciation of all among his countrymen who watch the progress of literature and science.

DANIEL COIT GILMAN.

Baltimore.

THE LONGFELLOW CELEBRATION AT CAMBRIDGE.

CAMBRIDGE, Mass., February 28.

The celebration of Longfellow's centenary culminated in the meeting held last evening in Sanders Theatre under the auspices of the Cambridge Historical Society, which planned to have as speakers only those who had known the poet personally. Since Longfellow died at seventy-five, and since many of his younger contemporaries are still living, this could be happily carried out. Col. Higginson and Professor Norton had known the poet since their boyhood, a period of more than forty years; President Eliot was a student when Longfellow still taught at Harvard; and Mr. Howells and Mr. Aldrich, of all the younger generation of American men of letters, had been most intimate with him. The co-operation of these friends gave to the commemoration a most fitting personal quality; for of all our poets, Longfellow is the friendliest. In him the man and the artist are so merged, and both so lovable, that any one who has drawn near to him recognizes that no remembrance of him could be adequate which lacked the human, the deeply human note.

The exercises in Sanders Theatre, like every similar observance in this neighborhood of Longfellow's birthday, were remarkable for the absence of the superlative. Nobody put forth extravagant claims for Longfellow's genius; every one seemed to be prompted by the recognition of the fact that simply to state what he was and did was better than any eulogy. Adulation is, indeed, as out of place in connection with Longfellow, as it seems inevitable wherever two or three of the admirers of various other poets are gathered together. So we heard no predictions that Longfellow would be read as long as the English language is spoken, and no demonstration that he is greater than Shakespeare. The men who brought their tributes of admiration and affection knew well the value of the sweet and beautiful things of life, and they felt under no obligation either to defend the Ten Commandments or to brag about them. They took it for granted that that particular audience did not need to be persuaded that love of home, family affection, delight in the presence of little children, courage to face the average human lot, unswerving friendship, loyal citizenship, and the striving after ideals are desirable.

Sanders Theatre was packed by more than two thousand persons. On the stage, besides the speakers, the officers of the Cambridge Historical Society, and local celebrities, sat many guests, including Gov. Guild and several well-known authors, among whom were Miss Jewett, Mr. Cable, and Mr. Owen Wister. Mrs. Julia Ward Howe, only twelve years Longfellow's junior, whose presence like that of a fairy godmother seems to bring perpetual youth with it, was greeted on her entrance by the spontaneous rising of the great company. Professor Norton presided with such grace and urbanity that the stage might have been his library and the audience his guests to whom he was presenting a cherished friend. That two of Longfellow's daughters and several of his grandchildren and other kindred were in the audience, added to the interest of the occasion.

Mr. Norton spoke briefly, pointing out the inestimable worth to a community of "the habitual presence in it of a good and pleasant man or woman," a blessing multiplied an hundredfold if to the rare character be added the poet's genius. Then in happy phrase he introduced Col. T. W. Higginson, who opened with this lively analysis of "a man who had, among all American authors of his time, the most individual and disarming combination of qualities":

> He was at once genial and guarded, kind and cordial in greeting, but with an impassable boundary line of reserve; dwelling in a charmed circle of thought, yet absolutely self-protecting; essentially a poetic mind, but never out of touch with the common heart; yet not so much a creator as a composer, and viewing his themes, as a very acute observer has said of him, in their relations, rather than in their essence. He was one to whom a poem might occur, as did the "Arrow and the Song," while he stood before the fire waiting for his children to go to church with him; and he was equally able to spend patient years in hearing and weighing "slowly and with decorum," as he says, the criticism of other and younger Italian scholars on his version of Dante. He was abstemious, yet wrote joyous drinking songs for his friends; did not call himself an Abolitionist, yet pronounced the day of the execution of John Brown of Ossawatomie to be "the date of a new revolution, quite as much needed as the old one." When worn with overwork, he could sit down to write 100 autographs for a fair in Chattanooga; or, perhaps, go out and walk miles to secure kindness for some old friend troubled with chronic and insuperable need of money. He was choice in his invited guests, yet drove his housemaids to despair by insisting on the admittance of the poorest children in Cambridge to tramp through his study daily or to sit triumphantly in the chair which their little subscriptions had bought for him. This was the man whom we meet to commemorate; this was Henry Wadsworth Longfellow.

Col. Higginson told also how one day, when he was an undergraduate at Harvard, reciting Molière to Professor Longfellow, there came a knock at the door, and presently there entered a printer's devil with a roll of proofs, the title-page of which bore the words "The Voices of the Night." "Had I but known what was to follow that bit of paper in the development of fame, or, what was more important, the creation of a literature, the rough rappings of the printer's boy would have been to me as solemn as those three momentous notes in Beethoven's Fifth Symphony which he himself interpreted to mean, 'Thus knocks Fate at the door!'" The fame there budding and since become world-wide need fear, Col. Higginson added, no serious reaction. "Evangeline" and "Hiawatha" and "The Village Blacksmith" are lodged forever in the memories of each generation of English-speaking children. "Who is alive, if these are not!" as Macready exclaimed of Shakespeare's characters.

After the Cambridge school children had rendered, by chorus and orchestra, C. F. Noyes's cantata, "The Village Blacksmith," Mr. Norton called upon President Eliot, who appropriately spoke of Longfellow's eighteen years of service as professor of belles lettres at Harvard. That service consisted not merely of the direct instruction he gave his classes, but of the poetic radiance he shed upon the college, and of his influence in the faculty, where he upheld the freedom of the teacher and the freedom of the taught. And during the years of reaction in national affairs, when freedom was distrusted and many Northerners would have compromised with slavery, Longfellow stood steadfastly for liberty and justice. President Eliot recalled how, on that very stage, he had congratulated Longfellow on the durability of his work, and the poet replied, "I don't know! I don't know!" "I have often remembered the touching modesty of that 'I don't know,'" said the president, who went on to describe with enthusiasm the shining benefits which Longfellow by his poetry conferred on Harvard and Cambridge, consecrating the town "with delights for generations to come," and making it a place of pilgrimage for the multitudes who love the poet and the haunts he loved. There is no other service comparable to the writing of noble poetry, "except at rarest moments, when some inspired soul pours itself out in prayer to the living God!" Nothing in the exercises was more impressive than President Eliot's brief address, in which appeared the deep religious fervor of his nature—that characteristic to which in these later years he has given freer and ampler utterance.

Owing to illness, both of the "young men," as Mr. Norton called Howells and Aldrich, were prevented from coming to Cambridge; but Mr. Charles T. Copeland read with fine effect Mr. Aldrich's poem which appears in the March *Atlantic Monthly*. It is so short that it can be quoted here entire, and thus the reader can taste its quality for himself:

LONGFELLOW, 1807-1907.

Above his grave the grass and snow
Their soft antiphonal strophes write;
Moonrise and daybreak come and go;
Summer by summer on the height
The thrushes find melodious breath.
Here let no vagrant winds that blow
Across the spaces of the night
Whisper of death.

They do not die who leave their thought
Imprinted on some deathless page.
Themselves may pass; the spell they wrought
Endures on earth from age to age.
And thou, whose voice but yesterday
Fell upon charmèd listening ears,
Thou shalt not know the touch of years;
Thou holdest time and chance at bay.
Thou livest in thy living word
As when its cadence first was heard.
O gracious Poet and benign,
Belovèd presence! now as then
Thou standest by the hearts of men.
Their fireside joys and griefs are thine;
Thou speakest to them of their dead,
They listen and are comforted.
They break the bread and pour the wine
Of life with thee, as in those days
Men saw thee passing on the street
Beneath the elms—O reverend feet
That walk in far celestial ways!

Mr. Norton was equally fortunate in securing Prof. Bliss Perry as a substitute to read the essay which Mr. Howells had prepared—an essay in which biography, reminiscence, and criticism were blended with equal skill and charm. No living American approaches Mr. Howells in this vein, and, so far as one may judge from a single hearing, he himself has never excelled this tribute to Longfellow, in which, after describing his own lost youth, with its first days in Cambridge and the Olympian evenings spent in Longfellow's study, listening to the translation of the "Divine Comedy," he

proceeded to appraise Longfellow's poetry. He laid special stress on the artistic perfection of the poems and on the poet's ethical strain, akin to that of Dante, Milton, and Wordsworth, "and as authentic."

Mr. Norton brought the exercises to a close by relating that several years ago, when he and Rudyard Kipling were discussing the poets of the nineteenth century, they debated whether all had not written too much. "We could spare half of Wordsworth, and three-quarters of Shelley, and even Keats could be trimmed to the advantage of his fame," Mr. Norton suggested. "But there is one poet," replied Mr. Kipling, "of whom I don't wish to give up a line." "I can't guess who he may be," Mr. Norton said. "Longfellow," Mr. Kipling replied. One would like to have the psychologists determine whether the affinity of opposites explains this preference.

"And now I bid you good-night," Mr. Norton said, and the great audience dispersed. The celebration was pitched throughout in the proper key; no jarring word was spoken, and—save for the absence of Mr. Howells and Mr. Aldrich—nothing marred the complete success of the programme. The commemoration itself seemed to have more than a personal scope. In listening to these speakers, it seemed as if all were unconsciously paying tribute through Longfellow to the ideals which he sang and exemplified, and that the audience were joining in a ceremony of reaffirmation. At a time when public and private morals are corrupt, and wealth is popularly believed to be able to purchase everybody and everything—even immunity from punishment—those eminent and wise speakers and the audience which applauded them reaffirmed their faith in what is wholesome and true, in character which is beyond price, in joys and satisfactions which money cannot buy, in ideals which never deceive. Happy, thrice happy Longfellow, whose genius and personality are as naturally associated with these eternal concerns as sunrise is with hope. WILLIAM ROSCOE THAYER.

NEWS FOR BIBLIOPHILES.

A little book which is a veritable curiosity in American typography has recently come to light. It is without question one of the crudest specimens of printing which has ever been produced, and is probably unique in the history of bookmaking. It is a pamphlet, consisting of title-leaf (verso blank), and nineteen pages of text and a page of errata. The title reads as follows:

The | Taxation | Of North America; | An exceilent Song, | composed in the | Revolutionary | War. | 'No more against our land, shall | strangers rise.'—Dwight. | First Edition. | Wells, Ver. | Printed by O. A. Bowe. | 1824. |

It is stitched in a cover made from part of the *Missionary Register* for November 5, 1823. On the cover is written in an old hand, "Taxation Song—printed in March & April A. D. 1824." The story that comes with the book is that "it was printed by a farmer, between seasons, from wooden type cut by himself, for the purpose of preserving the text of the song," and that two copies only were printed. The appearauce of the book seems to bear out this statement. Each page consists of two stanzas, eight lines each. The extreme unevenness of the letters in almost every line indicates separate types, while the lack of uniformity in the shape of the same letter shows that the letters were not cast or stamped from dies. Practical printers to whom the book has been shown agree that it was printed from separate engraved types, either of wood or some soft metal, perhaps lead or an alloy. Part of the text of the poem, with a slightly different title, is found in the "Illustrated Ballad History of the American Revolution," New York, 1876; "American Taxation. By Peter St. John of Norwalk, Conn." As there printed the text includes only twenty-four stanzas of eight lines each, instead of thirty-seven, as in this edition. What is evidently another edition of the same poem, or part of it, is entered in Gilman's "Bibliography of Vermont," as follows: "American Taxation. A Song of the Revolution. 1776. W. W. Curtiss, printer, Bradford, Vt. 12mo. 4 pp. n. d."

On March 11 and 12 the Anderson Auction Company sells a collection of engravings, including American prints belonging to Edward R. Warren of Boston. The most valuable items are unusually good specimens with wide margins of that extremely scarce pair of uucouth portraits of Washington and Mrs. Washington, engraved by J. Norman.

In a letter to the London *Athenæum*, of February 23, W. Roberts gives evidence to show that the text of the two little books, "King Glumpus" (1837) and "The Exquisites" (1839), was not by Thackeray, as has been commonly held, but by the late John Barrow, F.R.S., F.S.A. Mr. Roberts's authority for this statement is Mrs. Ellicott, the widow of the Bishop of Gloucester. She is a relative of Thackeray, and her father was an intimate friend of Barrow. She says that Barrow's authorship was a well-known secret to her father and herself. Thackeray was merely the illustrator of the books. Both volumes were unknown till in 1898 Bertram Dobell discovered a copy of each. A copy of "The Exquisites" sold at Sotheby's auction December 17, 1898, for £58; and another copy, with the litho graphic plates colored for £85 at Hodgson's March 9, 1904. "King Glumpus" brought £101 at Hodgson's in August 1, 1906. A choice copy of each will be offered at Sotheby's in March 16.

Several important items appear in the catalogue of a small collection, including the library of the late William Roots, to be sold in London by Hodgson & Co. on March 20. Not the least of these is the original drawing by "Phiz" (Hablot K. Browne) for one of the famous plates, the "Trial Scene," of "The Pickwick Papers." Browne's first drawing to illustrate this scene did not meet with Dickens's approval, and the artist made a second effort. It is the original of this later illustration, the one adopted by Dickens, which is to be offered for sale. Thackeray collectors will be interested in a little sketch book used by John Grant Brine, a close friend of Thackeray in the early days, 1835-1836, in Paris. It contains six pencil sketches by Thackeray. The printer's copy of Thackeray's Essay on George II. in "The Four Georges," 47 leaves, is in the hand of a copyist, but has autograph corrections or emendations on almost every page. A series of manuscripts, being replies, made about 1770, by the governors of several American colonies to a number of questions, although contemporary transcripts, are valuable. The Virginia manuscript is 40 pages, that of South Carolina 50, Massachusetts and Maryland each 15, Georgia 29, and Connecticut 13. Hakluyt's "Voyages," 1598-1600, Linschoten's "Voyages," in English, 1598, and a set of "Purchas his Pilgrimes" are among the printed Americana offered.

The stories of the old book-collectors who, browsing around the penny boxes of the book stalls, found first editions worth many pounds are read nowadays with incredulity, and as occurrences of a happy though long past age. Yet the finds of Dibdin, Collier, Hazlitt, and George Brinley have been surpassed within the past few months. Last summer an American looking over the rubbish in a book-barrow on one of the quays of Paris picked up for twenty centimes a little book of forty leaves with the title "Des Sauvages, ou, Voyage de Samuel Champlain, de Brovage, fait en la France nouvelle, l'an mil six cens trois." The American had the volume bound in brown morocco by Zaehnsdorf of London; and last week Tuesday it brought $2,900 at the auction of the Merwin-Clayton Sales Company of this city. As we have already pointed out, this is Champlain's first book, and this copy is the undated issue of which only four or five copies in all are known. Robert Hoe's, formerly Charles H. Kalbfleisch's, seems to be the only other one in private hands. Mr. Hoe also owns the equally rare issue with the title dated 1604.

In 1866, as an evidence of her appreciation of his munificence in giving $2,500,000 for building lodgings for the poor of London, Queen Victoria wished to make George Peabody a baronet. He refused the honor, but expressed a wish to receive an autograph letter from the Queen. Such a letter she wrote, six pages, 12mo, on paper having a wide mourning border. Peabody apparently had prepared an accurate lithograph facsimile for presentation to friends. This facsimile, which is an admirable reproduction, well capable of deceiving experts, is not infrequently offered as a genuine letter. In the Merwin-Clayton Sales Company's catalogue of March 1 oue of these facsimiles was described as genuine, but the true character of the document was discovered before the sale. The document sold for $2; the original would have brought several hundred. The original letter was deposited by Mr. Peabody in the Peabody Institute Library, founded by him at his birthplace, Dauvers (now Peabody), Mass.; and the librarian, Lyman P. Osborn, writes, under date of February 25, that it is still there.

Sotheby, Wilkinson & Hodge of London sold on February 20 the library of R. Kirkman Hodgson of Ashgrove, Sevenoaks. Among the prices are the following: Cervantes, "Persiles y Sigismunda," first edition, Madrid, 1617, £9 15s.; Purchas's "Pilgrimes," 5 vols., 1625-26, £49; Shakespeare, Second Folio, T. Cotes for R. Allot, 1632, imperfect, £54 10s.

Correspondence.

THE ENGLISH IN EGYPT.

TO THE EDITOR OF THE NATION:

SIR: In your article "English Rule in Egypt," in the *Nation* of February 21, this sentence appears:

But just because British rule has achieved so many material reforms, we have the right to inquire whether it has also made the natives contented and happy.

In the interests of fair play, you will no doubt be glad that your readers should have the testimony, not only of an Englishman with a grievance, but of an outsider, who approaches the subject without prejudice. I refer to A. B. de Guerville, the author of "New Egypt," a Frenchman, who is not likely to be an Anglophile. In the February number of the *Fortnightly Review* he has some apposite remarks on the point you raise. The italics are mine.

I have passed the last two winters in Egypt and the Soudan, and have been in daily contact with all classes of the population there, studying the subject with the greatest interest and the most absolute impartiality. Now, I have arrived at the conclusion that from the bottom to the top of the social scale the inhabitants of the country, the very great majority of the inhabitants, recognize the work achieved by England, pay her a real debt of gratitude for their present prosperity, and are *perfectly satisfied* with the existing state of tbings. *Of this there cannot be any doubt.* . . .

We find Egypt rich and prosperous; a great portion of her debt paid, an admirably adjusted budget; her revenues increasing enormously, regularly every year—and that in the face of large and important public works, works which daily augment the wealth of the country. Agriculture is advancing by leaps and bounds, while commerce and industry develop and increase with a rapidity unparalleled in the history of the world. A well-organized network of railroads, steam navigation, telegraphs, telephones, and excellently maintained canals, spreads over the country. Schools of every kind have been opened—primary, secondary, and higher schools, technical, commercial, and medical schools. The fellah works *quietly and happily* on his land, and the townsman is growing rich, while business prospers increasingly from one end of the country to the other. From the mouths of the Nile, from Alexandria to the great lakes of central Africa, all across Egypt, Nubia, and the Sudan, peace and quiet reign everywhere. And—strange as it may seem—all these results have been obtained, not by increasing the taxes, but, on the contrary, by reducing, and even in some cases abolishing them altogether.

M. de Guerville's account of the proportions and origin of the "discontent" in Egypt is most interesting, but too long to quote. I would recommend the whole article to such of your readers as may be interested in getting at the truth of the matter. ARCHIBALD MACMECHAN.

Dalhousie College, Halifax, N. S., February 23.

Notes.

McClure, Phillips & Co. announce the following books for this spring: "The Princess Virginia," by C. N. and A. M. Williamson; "The Leopard and the Lily," by Marjorie Bowen; "The Whirlwind," by Eden Phillpotts; "Fanshawe of the Fifth," by Ashton Hilliers; "The Siamese Cat," by H. M. Rideout; "The Smiths," by Keble Howard; "The Silent Door," by Florence Wilkinson; "The Trimmed Lamp," by O. Henry; "The Bird of Time," by Mrs. Wilson Woodrow; "His Courtship," by Helen R. Martin; "He Knew Lincoln," by Ida M. Tarbell; "The Great American Pie Company," by E. P. Butler; "The Croxley Master," by A. Conan Doyle; "Pinafore Palace," by Kate Douglas Wiggin and Nora Archibald Smith; "From King to King," by G. Lowes Dickinson; "A Night in Avignon," by C. Y. Rice; "The Story of Life Insurance," by B. J. Hendrick; "Through Portugal," by Martin Hume, and "England and the English," by F. M. Hueffer.

The Arthur H. Clark Co. announces the following books: "The Collected Works of the Right Rev. John England," seven volumes, edited by the Most Rev. S. G. Messmer; three additional volumes, 47, 48, and 49, of the series "Philippine Islands; 1493-1898," edited by Blair and Robertson; the final volume of the series "Early Western Travels; 1748-1846," comprising an extensive analytical Index; "The Discovery, Conquest, and Early History of the Philippine Islands," by Prof. E. G. Bourne; Antonio De Morga's "History of the Philippine Islands," edited by J. A. Robertson; Vol. 2 of Prof. Walter L. Fleming's "Documentary History of Reconstruction."

The New Universal Library of E. P. Dutton & Co. is to contain the works of Ruskin in fifteen volumes.

A new edition of Boswell's "Johnson," edited by Roger Ingpen, is announced by Sir Isaac Pitman & Sons. Its distinguishing feature will be the illustrations, of which there will be some four hundred, including twelve photogravure plates.

John Lane Company is publishing a "Life of Chesterfield," by W. N. Craig. The special aim of the book is to set forth Lord Chesterfield's zeal, foresight, and incorruptibility as a political agent.

There is to be a new Southern periodical which starts, at least, with every promise of success. On April 15 will be issued the first number of *Uncle Remus's Magazine*, edited by Joel Chandler Harris. Mr. Harris himself furnishes editorials and stories, and all the talent of the South has been engaged to contribute.

Bliss Perry, writing sympathetically of "The Centenary of Longfellow," in the *Atlantic*, touches one phase of the poet's work that has been rather ignored in recent appreciations. He says:

There can be no happier fortune than that which has made him the children's poet. They are untroubled with scruples and hesitancies. If there were a language for such childish secrets, the sweet voices that recite with delicious solemnity "The Children's Hour," might tell us more about Longfellow than we professional critics—with our meticulous pedantry, our scrutiny of "sources," our ears so trained to detect overtones that we lose the melody—shall ever learn.

A further tribute to the poet are Thomas Bailey Aldrich's finely wrought verses which we print elsewhere.

None of our English novelists has been more pleasantly and adequately presented than Mrs. Gaskell in the Knutsford edition, of which Putnams have just issued the concluding five volumes. Dr. A. W. Ward, who, with the assistance of the Misses Gaskell, adds the Introductions, writes of the characters of the tales as if they were real people. Nor does he fail to explain the circumstances under which each book was written, and to relate it to other works of fiction of the time. His wide reading enables him to illustrate the work in hand learnedly, but without ostentation or pedantry. The new material in this edition, both editorial and textual, will afford the occasion later on for a more extended study of Mrs. Gaskell in the *Nation*.

A new volume in Heath's Belles-Lettres Series contains a selection of "Early Sixteenth Century Lyrics," edited by Prof. F. M. Padelford of the University of Washington. Wyatt and Surrey naturally furnish the bulk of the book, but a group of poems from miscellaneous sources follows, including several of Henry the Eighth's royal plaints. The distinctive feature of the work is the fact that all the selections are printed from the MSS. or from the earliest editions, and the editor points to the present text of Surrey to show the unsatisfactoriness of previous texts based upon Tottel's "Miscellany." The reproduction of the old spelling will have its attraction for scholars and other readers will scarcely be concerned. Of the Introduction and notes a good deal might be said. Professor Padelford follows the present trend in seeking the Italian and French sources of the English. His criticism is judicious, but one could wish he had not fallen into the snare of supposing, after Sidney Lee, that these amorous verses are addressed necessarily to a fancied mistress. For love, after all, is a pretty common sentiment, and the object of a man's passion may have been real enough, although he addressed her in stolen language.

Charles Stuart Calverley's Translations of the Idylls of Theocritus is the newest volume in the Riverside Press Editions (Houghton, Mifflin & Co.). Calverley is better known as a parodist. His "Fly Leaves," reprinted more than twenty years ago in Henry Holt & Co.'s Leisure Hour Series, ran through several editions and made his lighter verse familiar to many American readers. The renderings of Theocritus, which show Calverley at his best, were originally published in 1869, and have twice been reprinted in small editions. Few translations have succeeded so well in reconciling and realizing the two ideals of fidelity and felicity. The Riverside Press Edition is a fitting vehicle for these exquisite verses. The type is italic, the paper hand made; the margins are generous. The title, the three main divisions of the volume, and numerous short pages are ornamented with appropriate subjects from antique gems engraved on wood by M. Lamont Brown. Three hundred and thirty copies are printed, of which three hundred are offered for sale.

The "Select Epigrams of Martial, Books VII.-XII.," edited by R. T. Bridge and E. D. C. Lake, and published at the Clarendon Press, is an excellent book for supplementary use in the upper classes of high schools or the lower college classes. With a little judicious explanation of Roman life on the part of the teacher, these epigrams may be made thoroughly interesting; they are short and suited to fit in odd moments for

the sake of variety, and the notes are such as to make any required preparation extremely easy.

The latest additions to Everyman's Library (Dent-Dutton) fall under the division of Theology and Philosophy. They are Hugh Latimer's "Sermons," Sir Thomas Browne's "Religio Medici," Butler's "Analogy," Law's "Serious Call to a Devout and Holy Life," John Wesley's "Journal" (4 vols.), F. D. Maurice's "Kingdom of Christ" (2 vols.), F. W. Robertson's "Sermons on Christian Doctrine," "Sermons on Religion and Life," and "Sermons on Bible Subjects," and Principal T. M. Lindsay's New Testament. All of these books, not excepting the "Religio Medici," may fairly be classed as standard divinity. All of them are interesting as presenting a theory of a devout and well-ordered life, rather than a system of theology or the creed of a sect. Wesley's "Journal" is especially entertaining, as it draws with many intimate touches the picture of a unique and powerful personality, the founder of Methodism.

In addition to the work of specialists in Biblical study there will always be need of popular treatises by men who possess accurate information and sound judgment as to the results of scholarship. An excellent book of this sort is "The New Appreciation of the Bible," by Willard Chamberlain Selleck (University of Chicago Press). Dr. Selleck writes briefly of the history of the Bible, contrasts succinctly the traditional and modern views of both the Old and New Testaments, and presents a clear summary of the principal critical conclusions and their bearing upon the ideas of inspiration and authority. He is persuaded that the Bible must always be read chiefly as a religious book, and also that its spiritual use must be consonant with the truth about its nature. His endeavor, therefore, is not only to convey information as to what critical scholarship has accomplished, but also to induce intelligent and thorough study of the book on the part of those who turn to it for stimulus and enlightenment. In the presence of multiplicity of detail Dr. Selleck has preserved a good sense of proportion. Readers of his careful chapters will have little to unlearn if they pursue their studies further.

The "Evolution of Religions," by Everard Bierer (G. P. Putnam's Sons), shows an excellent spirit, and the greater part of its material is taken from good sources. The title, however, is too large for the contents, and the book suffers somewhat from the author's insufficient acquaintance with the general history of religions.

The present state of the controversy respecting the authorship of the "De Imitatione Christi" is set forth by J. E. G. de Montmorency in his "Thomas à Kempis" (G. P. Putnam's Sons). He gives lists of manuscripts of the treatise in English libraries, of other manuscripts cited, and of printed editions, together with Gerson's tract "De Meditatione Cordis" and an extract from the "Garden of Roses" of Thomas à Kempis. After a careful survey of the evidence he decides in favor of Thomas as the author of the "Imitation." He has brought togetber many facts of general interest, and his discussion is broad and candid. There are added numerous illustrations, all of them reproductions from fifteenth-century manuscripts or printed books.

The New Church Board of Publication issues Swedenborg's little book, "The Proprium, or What of Man Is Not His Own," with an introduction by John Bigelow. The Proprium, it may be added, is in Swedenborgian phrase the individual life which runs counter to the universal, spiritual life, and which is thus the cause of evil and the hindrance to righteousness.

"The Boy's Friend" would be an appropriate sub-title for Ethel M. Hogg's biography of her father, Quintin Hogg (E. P. Dutton & Co.), for the ruling motive of his life was to help boys. The son of a titled and wealthy London merchant, an Eton graduate and boon companion of noblemen's sons, before he was out of his teens he began his life work. Disguising himself as a shoeblack, he would sally forth to earn a few pence by holding horses, blacking boots, or doing other odd jobs; and he would spend two or three nights a week curled up in a barrel, under a tarpaulin or on a ledge in the Adelphi arches, learning to know the boys he meant to rescue, making their life his life, their language his language. "It was from thus becoming conversant with the needs of the poor youngsters of our capital," says his lifelong friend, the Duke of Argyll, "that he was led to found the Polytechnic, a training industrial school which should minister at once to the health of their minds, bodies, and souls, and give them opportunities of acquiring the practical and scientific knowledge useful to them in their various trades." Among the recreations which he provided were widely scattered holiday homes, in one of which, at Lucerne, during the season of 1903, "seven thousand persons were accommodated." Naturally the larger part of the biography is devoted to an account of the development of this institution, making it an invaluable record for the study of workers in a similar field. But even the casual reader will find much of interest in the suggestive anecdotes, often brimming over with humor, of the way in which boys were helped, in the numerous letters giving them counsel, and especially in the bright descriptions he wrote them of his foreign trips, to the far East, to Guiana, where his business house had extensive sugar plantations, and to this country. The book is too long and contains much that is trivial and unworthy of publication, but as a whole it is a stimulating account of a noble, self-sacrificing life.

In "The Building of a Book" (the Grafton Press), edited by Frederick H. Hitchcock, there is brought together an unusual group of brief papers by expert hands on every subject connected with the writing, manufacturing, selling, advertising, and reviewing of a book. So minute is the work that, for example, it contains descriptions of all the machines used in the bindery. The book may satisfy the curiosity of a good many and prove directly useful to a few.

Much that is interesting for sportsmen is to be found in "The Book of Camping and Woodcraft" by Horace Kephart (New York: The *Outing* Publishing Company). Of particular value are the instructions regarding making and keeping a camp, cookery, and methods of travel in the forest.

Volumes xiv. and xv. of the new "Meyers Konversationslexikon" (Lemcke & Buechner) carry this great encyclopædia from Mittewald to Plakatschriften. Of the qualities of the work—its scope, accuracy, and serviceableness—it is not necessary to speak again. It is, of course, edited primarily for Germans, and an overbalance of German names and matter is natural and right. But a certain inequality in the English and American titles renews the wish that we had an English encyclopædia of the same character. As examples of this inequality of execution we might point to the fact that Walter Pater is included, while Pepys is omitted, or that the map of Nuremburg is excellent, whereas New York receives scant representation, or that in the list of living Oriental philologists the English names are rather freakishly selected, and American scholars (some of them of very high international standing) are not mentioned at all. So, again, under "Philosophy" there are two plates giving twelve portraits, all of Germans. To include Wundt and Fischer and Nietzsche while omitting Bacon, Descartes, Spinoza, and Locke, is mere chauvinism. However, these errors in proportion are but slight blemishes in a work which shows the most careful and thorough editing. Special praise ought to be given to the excellence of the maps and illustrations. No reference library can be without this new (sixth) edition of Meyers.

The Academy of Sciences in Krakow has begun the publication of a new legal collection on a large scale called "Corpus Juris Polonici." It is to contain all the Polish statutes from the oldest period down to 1795, and in this way is to take the place of the old incomplete and uncritical "Volumina Legum." The first volume, being the third of the first division of the series, and containing the material from 1506 to 1522, has been prepared by Oswald Balzer and has just made its appearance.

In the *Deutsche Revue*, Dr. Wilhelm Ostwald publishes a plea for university chairs to be occupied by men not under any obligation to teach, but engaged wholly in research. The writer contends that at present original research is only a side issue with the average university professor. He seems to regard with something like envy the rich financial equipment of some English and American institutions, which have already been able to establish a number of research professorships; and he maintains that Robert Koch, the Berlin bacteriologist, is the only one in the learned world of the Fatherland who enjoys a position financially independent enough to devote his whole time to research.

The marked tendency in Germany to crowd the old classics from the curriculum of the secondary schools and substitute scientific and other non-classical branches, is apparent from the action of the National Association of Engineers, demanding that mathematics and natural sciences be substituted for some of the language studies. The Verein has declared in favor of the so-called "reform" gymnasium, tried experimentally in several cities, which has no Latin in the first six

years, and in the last three divides its curriculum into three elective groups, one of languages, a second of mathematics and the sciences, and a third of modern languages. The engineers have in making this demand seconded the proposals of the National Association of Physicians in their recent convention in Stuttgart. An appeal has heen made to the Prussian Cultus Ministry to make the experiment of applying these demands in a numher of its State gymnasia; or still better, at once convert several of the classical into full-pledged "reform" gymnasia.

The report of the Krupp Library of Essen, Germany, covering the years 1899-1906, presents statistics of use and growth which compare favorahly with those of any American public library, and illustrate the reading hahits of the artisan class in Germany. When the lihrary was first projected, fears of ill success were generally expressed, hased on the supposed indifference of the workmen. From a collection of 7,500 volumes, however, the library has now grown to 51,750 volumes, and two-fifths of these are in constant circulation. The readers numher 14,450, and during the fiscal year 1905-6 they drew out 388,001 hooks. It may be interesting to note that the population of Essen is ahout equal to that of Troy, N. Y., in which city the puhlic library reported for the same period a circulation of 62,000 volumes, ahout one-sixth that of the Krupp Library. Especially striking are the statistics reported for the juvenile department, where, in seven years, there has been a growth in circulation from 7,961 volumes to 84,340. The spirit of the management and of the reading public alike is shown hy a liberal provision in the rules allowing readers to take as many books at a time as they wish, and by the fact that during four years only two volumes have heen lost.

The committee of one hundred, organized under the leadership of Joseph H. Choate, to provide a national memorial to the late Carl Schurz, appeals for $250,000. It has already received $40,000. The money will he used:

(1.) To promote, in some effective manner, a wider application of the principles of civil-service reform.
(2.) To promote the extension of Germanistic culture in the United States.
(3.) To commemorate Mr. Schurz's work for the advancement of the negro and Indian races through the erection of a suitahle building or other memorial at the Hampton Institute.

Ada Lydia Howard, first president of Wellesley College, died on Sunday, in Brooklyn. Miss Howard was horn in Temple, N. H., in 1829, was educated in private schools in Lowell, Mass., and at Mount Holyoke College, and then hecame a teacher. She taught at Mount Holyoke and conducted a private school of her own hefore she became the first president of Wellesley College in 1875. She held the office till 1882, when failing health prompted her to resign. She was the first woman college president in the world.

The foreign papers bring news of the death of Prof. Ferdinand Justi, in his seventieth year, at Marburg, where he was born and educated, and where he lived as a memher of the university faculty until the end. He was a distingulshed philologist of the Aryan languages, particularly of the Persian. Among his puhlications are a translation and glossary of the "Bundehesh" (1868), a "History of the Oriental Nations in Ancient Times" (1885), a "History of Irân" (1897), and "The Life and Legend of Zarathustra" (1905). He was also concerned in the completion (1879) of a French-Kurdish dictionary, compiled under the auspices of the Imperial Academy of St. Petershurg.

TENDENCIES TOWARD SOCIALISM.

The Pattern Nation. By Sir Henry Wrixon, K.C. New York: The Macmillan Co. $1 net.

"The problem [of the day] is," writes Sir Henry Wrixon, "What will the poor do with the rich? It arises when, on the political side of life, lawful government hy the majority of the people hecomes an established fact, in vindication of the principle that men are equal; while the industrial and social side of life is still left to he controlled hy methods that have for their foundation the fact that men are unequal, and that their rewards in life are to he unequal also." These sentences define the question which our author's treatise is nominally intended to answer. The hook may easily therefore be mistaken for a mere prediction as to the course which modern Europe and America will follow. But Wrixon has in reality, whatever his intention, produced something much more valuahle than one of those political prophecies which may startle or amuse hut do not permanently interest or influence thinking men. He has given us a suhtle analysis of the state of opinion with regard to social progress now prevalent in England. Whoever, indeed, analyzes the condition of society may become, without intending it, a prophet. In January, 1848, Tocqueville described to the French Chamber of Deputies the feelings and aspirations of French artisans in words which predicted the Revolution of February, 1848. Our author, who in spirit helongs to the school of Tocqueville, draws a picture of puhlic opinion in England in 1906. It may well turn out that he has given a forecast of impending events or catastrophes. He writes, it is true, only of the "Pattern Nation." He says nowhere that this model State is England, nor in his view are his words more applicahle to England than to other countries. But here again he resemhles Tocqueville. The French writer is known by his "Democracy in America" and hy his "Ancien Régime," hut Tocqueville, whether he was writing ahout American Democracy, or ahout the government of France under the ancient monarchy, had his thoughts invariahly fixed upon the democratic spirit, as it existed or seemed to him at any rate to exist in the France of his own day. So Wrixon may write of the Pattern Nation. He may helieve, and rightly, that much of his doctrine is applicahle to France, to Germany, or to the United States. But his eye is always upon the England of today. The true merit of a volume which in its 172 pages contains more thought and more wisdom than is often to be found in hooks of tenfold its size, is that it suggests ideas which ought to arrest the attention of the whole English people, whether living in the United Kingdom, in the United States, or in England's self-governing Colonies. Three leading ideas which lie at the very hasis of his theories are preëminently noteworthy.

First: There exists in modern England a fundamental though an imperfectly recognized inconsistency hetween the political and social side of life. English political life is hased upon the idea, common to every modern democratic society, that human heings are suhstantially equal; or, to put the matter in the most moderate form, that the points in which human beings resemhle one another are far more important than the characteristics in which they differ. Hence the perpetual extension of the Parliamentary franchise which tends logically towards universal suffrage. Hence, too, the strength of the demand for votes for women. English social and industrial life, on the other hand, rests on the belief in the inequality of mankind. The ideal hy which in all matters of trade or commerce Englishmen have heen hitherto guided, is that there should he a free career for talent, and that everything should be governed hy unrestricted though fair competition. That this system does bring the best, that is, the strongest, men to the front, is certain. That it makes the world a very hard world for those who start with any disadvantage, physical, moral, or social, is equally certain. The struggle for existence produces much good, hut under the form of unrestricted competition it assuredly produces much suffering, and means that the minority of a country will have a far larger share of the good things of life than the majority.

Secondly: Since the majority of a democratic country either must be or will hecome the sovereign power, that majority—speaking hroadly, the wage-earners—must inevitahly desire social equality. This has long been perceived hy thinkers of every school. One consideration, however, has escaped their attention: They have not observed that just hecause the democratic theory, when fully accepted, gives to mere numbers full and legal sovereignty, it places in the hands of the poor the means of establishing, not hy hrute force, hut hy orderly and legal methods, the reign of social and industrial equality. The weapon for the attainment of this end is the unrestricted power of taxation. The despot, whether an hereditary monarch or a sovereign multitude, whose power of taxing is unlimited, can compel the rich to provide for the wants of the poor, or, in other words, can diminish hy degrees the difference hetween rich and poor. When the poor have sovereign authority, violence is folly. "You need not," to use our author's illustration, "smash the safe open when you have got the key." In England, household suffrage already lays the treasures of the state at the legal disposal of the poor. Various circumstances, moreover, favor the advance towards Socialism, or towards a policy which shall try to give to all classes an equal share in the hlessings of life; and it is in the description of these conditions that the most important part of the "Pattern Nation" consists. Wage-earners naturally approve any scheme of taxation which, for example, hy providing old-age pensions, lightens for the mass the hurdens of life. But the most striking feature of the present time is the feebleness of the resistance made by men

of wealth to socialistic measures which fifty years ago would have been resisted by every person who had a tolerable income or who even earned good wages. The causes of this change in attitude are various. Sympathy with those who undergo any kind of physical suffering tells for much. National prosperity increases the wealth of England and encourages the delusion that the resources at the disposal of the state are practically unlimited. Again, a course of action which tends towards Socialism and would involve many evils if adopted as a general rule, may happen to be expedient in exceptional cases. None but the most fanatical doctrinaires would object to giving state help to the population who have suffered from the earthquakes at San Francisco or in Jamaica; but it would be insanity to organize a plan of relief which made the inhabitants either of San Francisco or of Jamaica permanent paupers. At this very moment hundreds of semi-Socialists in England are prepared to give state help to men temporarily thrown out of work, and to do this without placing them in the position of paupers. But benevolence of this kind, meant to meet an emergency, certainly stimulates the idea that the state ought to provide employment for all. The semi-Socialism which thinks only of meeting an immediate want, falls in well with the systematic Socialism which aims to change the whole organization of society. The circumstance, however, which affords the greatest encouragement to Socialism is that at this moment the country enjoys the benefits of two essentially inconsistent systems. Englishmen still possess both the material wealth and, what is of more consequence, the individual energy of character, which under a democracy is the result of free competition; and at the same time the accumulation of wealth, which is really due to individual energy, provides the means by which socialistic schemes—*e. g.*, the payment to persons employed by municipalities of wages above those which would arise from the mere haggling of the market—may be carried into effect. This conceals for a time the fact that the system of free competition and the socialistic system are inconsistent with one another and cannot long coexist.

Thirdly: The very success of Socialism must, as Wrixon clearly believes, have two effects. It will diminish the individual energy and inventiveness which is due to competition. It will also in the long run make it necessary in matters of trade to substitute for the energy arising from free competition the force given by disciplined submission to the commands of the state. If every profitable business is to become at last a public concern, the mass of the population will become the servants of the state. The aim of the government must be at once to make the business of the state profitable and to keep the people in physical comfort on the profits. But the members of an industrial army whose energies are not stimulated by competition must be as well disciplined as an army of soldiers. The most competent leaders must bear rule. The rank and file must be trained to absolute obedience. Military discipline framed to attain the objects of industrial warfare as against all persons not belonging to the pattern nation must in its turn generate military ideas: we know already that an armed nation instead of turning soldiers into citizens is likely to imbue citizens with the feelings of soldiers. However this may be, Wrixon's teaching clearly points to the gradual development of an irrepressible conflict between thoroughgoing Socialism and democratic freedom. He does not undertake to prove that a socialistic state cannot be prosperous. What he does attempt to show is that if such a state is to prosper it will destroy individual freedom.

Our author's treatise suggests many criticisms. We will hazard one only, and that had best be put in the form of a question: Is it certain that the faith in the democratic dogma of human equality under the law is destined to retain its force and to produce its full logical results? Historical considerations assuredly leave the answer to this question open to doubt. Few are the thinkers who at the beginning of the twentieth century believe in human equality with the dogmatic enthusiasm which characterized many thinkers towards the end of the eighteenth century? It is at least possible that no European state may ever become in spirit thoroughly democratic. The ideas which make for Socialism, be it remembered, undermine enthusiasm for democracy; and democracy is the force which our author assumes may ultimately enable the mass of the people, by the exercise of sovereign power, to try socialistic experiments. What if this force of democracy on which he relies is already losing part of its strength?

TWO SAINTS OF SIENA.

Saint Bernardine of Siena. By Paul Thureau-Dangin. Translated by Baroness G. Von Hugel. New York: E. P. Dutton & Co. $1.50 net.

In 1896, P. Thureau-Dangin of the French Academy published his "St. Bernardin de Sienne," a work which has been justly praised for "its limpid felicity of style," its "quiet power of objective presentment, complete sympathy with its subject," and, above all, for a "serene impartiality which, nevertheless, takes none of the fire and life out of the book." Moreover, though a popular, it is also a learned work; and on its first appearance no less an authority than Signor Fortunato Donati, the secretary of the Commissione Senese di Storia Patria, declared that M. Thureau-Dangin had consulted practically everything which had as yet been printed about San Bernardino. In 1897 Monsignore Telemaco Barbetti translated the volume into Italian, with a number of original notes which added appreciably to the value. Two years later, a more exhaustive, but from a literary point of view vastly inferior, "Storia di San Bernardino da Siena e del suo Tempo" was published in Mondovì by F. Alessio, and this was supplemented in 1899 by a learned monograph, "L'Eloquenza di S. Bernardino," from the pen of D. Domenico Ronzoni (Siena: Biblioteca del Clero). Moreover, an important contribution to the subject of "the Spirituals," which is dealt with at some length by M. Thureau-Dangin in connection with "The Strict Observance" (Chapter V.), is to be found in Prof. L. Fumi's "Eretici e Ribelli nell' Umbria dal 1220 al 1330, studiati su documenti inediti dell' Archivio segreto Vaticano," published in successive numbers of the *Bollettino della Società Umbra di Storia Patria*, beginning with the year 1897.

With these works before him (to say nothing of the numerous articles which have appeared in various Italian periodicals) no one with a just appreciation of the responsibilities of a translator should have found it hard to produce a really adequate and up-to-date English version of Thureau-Dangin's delightful book. We only marvel that we have had so long to wait. The fault certainly does not lie with the subject; for, of all the saints in the Roman Calendar, it would be difficult to find one whose life and character appeal more strongly to Christians of every shade of opinion. The translation, however, is a disappointment. In the first place, we doubt whether the Baroness Von Hugel has an adequate knowledge of French; we are sure she has an inadequate knowledge of English. To say nothing of such uncouth words as "categorized," "sermonizer," "precisionize," and the like, we have "enaction" for "enactment" and "creditable" for "credible." "Disjointed inhabitants" is certainly no translation of "les habitants divisés." The book, too, is full of slang—for example, "sporting" for "displaying," and "hiding" for "beating"; while we read of "interceding to" the Deity, "exercising a criterion," and so forth.

These, however, are minor blemishes. In M. Thureau-Dangin's book there are numerous extracts from the forty-five sermons which Fra Bernardino preached in the Piazza del Campo of Siena in the year 1427, and which were taken down in shorthand by one of his auditors. These extracts probably constitute the most important part of the whole work, since, as Prof. Langton Douglas truly remarks, "the best portrait of the saint is to be found in his own sermons." These sermons were spoken and reported in the Tuscan tongue, racy and of the soil; and they must necessarily lose something even in the best of translations. Obviously, therefore, it was the duty of the Baroness Von Hugel to consult the original. This she evidently has not done, and, by the time M. Thureau-Dangin's French has been transmuted into the Baroness's English, the sayings of the saint are often barely recognizable. We have been at the pains of comparing every one of such passages, as they appear in her book, with the Italian of the "Prediche Volgari," and we are reluctantly compelled to declare that the true meaning is often hopelessly obscured. Notable instances occur on pages 14, 166, 175, 198, 204, 206, and 209; but they are scarcely more startling than many others.

Saint Catherine of Siena and Her Times. By the author of "Mademoiselle Mori." 28 illustrations. New York: G. P. Putnam's Sons. $2.75.

Nearly half a century has passed since "Mademoiselle Mori, a Tale of Ancient Rome," appeared, received the praise of the critics of the day, and found a permanent place as a minor classic read and reread like "Romola," "The Marble Faun," and "The Improvisatore," by travellers in Italy. Its author, Miss Margaret Denise Roberts,

a native of Wales, had even then so mastered the language, as to write all but the last chapter of the original manuscript in Italian. During the intervening years, Miss Roberts has not allowed her pen to grow rusty, but under varying pseudonyms has published other novels which have been well received. These years have been spent chiefly in France, Italy, and Germany, and have widened that knowledge of the literatures and customs of these countries, which forms the broad foundation for this readable, vivacious life of Saint Catherine of Siena.

More than two score writers are cited, chiefly Italian, and often not accessible to those who read only English. They range from "Fra Paolino," one of the earliest books in Italian, and "St. Pol le Ber," in early French, and Orlandino's "Tractate on Governing a Family," to Cardinal Capocelatro's and Mignaty's biographies of St. Catherine. Although now and then some document in the library at Siena or in the archives of Florence is mentioned, there is little evidence of any original research among manuscript sources or the discovery of any material not already in print. References to volume and page of the works quoted are rarely given and, on the whole, one is forced to the conclusion that the historian's well-documented life of St. Catherine is yet to be published.

If, conscious of the current of modern thought towards mysticism, a reader should turn to this book expecting to find a study of Catherine the Mystic, a pen picture of this early mediæval saint in the spirit of an altar-piece by Fra Angelico or Fra Filippo Lippi, such a biography as a Christina Rossetti might perhaps have written, he will seek in vain for an adequate presentation of that "astonishing spiritual vitality" which is necessary in order to explain her leadership among her people and in her Church. In Miss Roberts's opinion, St. Catherine has been judged too often with a prejudice which does not allow for the age in which she lived, or consider sufficiently the facts of her life; and has sometimes been regarded "simply as a saint," sometimes "as chiefly concerned with politics, so that in either case only a partial view of her is obtained." Miss Roberts's view is that Catherine of Siena was "very human, though a great saint." She had a blessed gift of good spirits, sang at her work, laughed with all her heart, could scold, too, if necessary, and was most unlike the drooping, conventual, nunlike figure which painting mostly gives as her likeness. In these pages the woman is emphasized, with saintly qualities to be sure, but a woman who will not be confined in traditional walks, who sees the needs of her times, and serves her day and generation, a dramatic figure influencing the destinies of Italy and the Popes, "one of the three greatest figures of the fourteenth century." But if, falling under the charm of this interesting biography, the reader is led to forget that the motives of to-day were not the motives of yesterday, that Caterina Benincasa was less the pioneer of the modern woman than at times she appears here, the turn of a leaf may place before him Verocchio's Statue, or one of Sodoma's paintings, and recall to him the conception of St. Catherine held by her contemporaries and immediate successors.

The illustrations are all reproductions of photographs, either paintings and statues of St. Catherine, or of places and objects associated with her life, nearly all in Siena. The commonly accepted designations of paintings are changed in order to introduce the name of St. Catherine, and details of larger pictures are given (*e. g.*, that by Francesco di Giorgio, opposite p. 136), with nothing in the inscription to indicate that the entire painting is not reproduced; and as a rule there is no indication of the place where the painting or statue is preserved. Throughout the book there are evidences of careless proofreading, which permits "merely" to take the place of "nearly" (p. 7), "See" of "Sho" (p. 12), and "Mr. Jameson" of "Mrs. Jameson" (p. 63).

STUDIES IN HISTORY.

History of Egypt, Chaldea, Syria, Babylonia, and Assyria in the Light of Recent Discovery. By L. W. King and H. R. Hall, Department of Egyptian and Assyrian Antiquities, British Museum. One hundred illustrations. London and New York: The Grolier Society.

Emphasis is to be placed upon the last six words of the title. We are told that the ignorant destruction or removal of the antiquities of Egypt by natives for purposes of sale to tourists, is going on so rapidly that the field will be exhausted in another decade. To some extent the same danger besets the antiquities of Mesopotamia and Syria, where the native superstition sees in a sculptured or inscribed stone a repository of precious metals, the source of untold wealth. In these ways many precious records of antiquity have been destroyed. It is with interest that one reads of efforts to forestall so dire an issue and to secure what remains. The results of the various excavations are published periodically, as in the admirable "Memoirs" of the various branches of the Egypt exploration fund. But the sum total is ever growing, and its story is scattered in a multitude of places. To have the *disjecta membra* brought together and digested is exceedingly useful. This is the task which Messrs. King and Hall have performed. Taking the history of the respective countries, principally Egypt and Mesopotamia, as threads, they have strung upon them the newly discovered facts which bear upon the story of each country. Sufficient time has elapsed to enable them to exercise considerable criticism upon the materials in hand, and this criticism is to the entire advantage of a clear understanding of the significance of each item.

It is indicative of the activity of the few years since the publication of Maspero's "History" that so large a volume has been found necessary to expound the significance of the new data. The preponderance of Egypt over Western Asia in the space is only about thirty pages. The most striking facts bear particularly upon the earliest period. In fact the pre-dynastic history of Egypt has been traced so far as it can be, now, from materials discovered within a decade or so. It is, however, too soon to say that all of the deductions based upon these recently discovered facts are reliable and permanent, particularly as conclusions apparently sound may be wholly upset at a moment's notice by a shovel or pick.

Egypt is particularly fortunate in the fact that dryness of climate has preserved the memorials of its history so remarkably. Assyria and Palestine, on the contrary, are rainy lands and all traces of objects less lasting than terra-cotta or stone have disappeared. "There is little hope that prehistoric Chaldea will ever be known to us." In Egypt the written records go back nearly 4,000 years B. C., and the Neolithic remains much further, while the Palæolithic come from a time when climate conditions were different. The perfection of the flint clipping and of the potter's art, as well as the grace of the stone vessels which date from this age, all point to a long course of development. The first three dynasties were represented in previous treatises by a list of royal names of persons who were for the most part names only. The excavations of De Morgan, Petrie, and others have given these shadowy persons substance. Their period promises in the near future to take on the shape of veritable and exact history.

In this place it is impossible to go into details, but it may be said in brief that the authors have traversed the field of recent discovery and research, have extracted the vital facts, and have set them down with care and criticism.

Studies of Roman Imperialism. By William Thomas Arnold. Manchester: University Press.

The author was the grandson of Thomas Arnold, well known through his "History of Rome," and nephew of Matthew Arnold. The memoir which introduces the volume was written by his sister, Mrs. Humphry Ward, and C. E. Montague, his friend and colleague. Mr. Arnold, born in Australia in 1852 and graduated from Oxford in 1876, published three years later his prize essay, "Roman Provincial Administration." It remains the chief English authority on the subject; and a new edition, prepared by E. S. Shuckburgh, will soon be printed. In the same year Mr. Arnold took a position on the editorial staff of the Manchester *Guardian*, and he continued at this post till he was compelled to retire (1898) by the long illness of which he died in 1904.

In attractive and sympathetic style Mrs. Ward narrates the development of her brother's mind through its expanding interest in poetry, the fine arts, politics, travel, and history. The most serious of his avocations was Roman history, for which he was well equipped by his knowledge of the ancient and modern languages, of topography, and of the German historical method. His plan was to write a detailed account of the Empire from Augustus to Marcus Aurelius, but, unfortunately, his daily labor as a journalist prevented him from taking more than the first steps in that direction. The work which he actually accomplished, as presented in this volume, is limited to the Augustan age, with but an occasional glance at later developments. Two chapters are devoted to the Constitution, one to the domestic policy of Augustus, and four to the organization and administration of the provinces. The survey of the

dependencies is incomplete, for Britain, which, however, was not acquired till after Augustus. Africa west of Egypt, Syria, and several minor districts are not included. The work is therefore but a fragment. It is edited with notes and an introduction by Mr. Fiddes.

It may surprise the reader that Mr. Arnold did not bring to the study of history the journalist's interest in personal character. In the words of the editor, "his only full-length portraits are Augustus and Agrippa." Mr. Arnold found the character of Augustus important only as a factor in the readjustment of the relations between Rome and her subjects, involved in the change from republic to empire. These relations are his theme. The general reader will find the long description of tribes and communities rather dull, however valuable may be the final result of the study. The scholar may discover an obstacle to the use of the work in the circumstance that the sources cited are altogether inadequate to testing the accuracy of the treatment; and his suspicion will probably be awakened by the large number of evident instances of hasty interpretation or of actual misstatement, many of which the editor has attempted to correct, though not always with success. On page 64, for example, Mr. Fiddes, with Mommsen's "Staatsrecht," i., 554, before him, should have learned that the ædileship was not an essential step in the senatorial career of honors. This criticism has reference only to the practical value of the book; it would be unfair to judge the ability of the author by so incomplete a piece of work. The publication of his critical notes, which Mr. Fiddes describes as very extensive, might add to the reputation of the author, while it would certainly enhance the usefulness of his study. Notwithstanding its limitations, the volume is creditable to the author and to the friends who prepared it for publication. In the dearth of English books on the provinces, it is welcome.

Topliff's Travels. Letters from abroad in the years 1828 and 1829 by Samuel Topliff, Proprietor of the Merchants' News Room in Boston. From the original manuscript owned by the Boston Athenæum. Edited with a memoir and notes by Ethel Stanwood Bolton. Illustrated. Printed from the income of the Robert Charles Billings Fund. The Boston Athenæum.

The Boston Athenæum has begun to broaden and extend its work as a private library by the publication of some of the important and interesting manuscripts in its possession. The first of the series was "Le Forestier's Relation," the autobiographic account of the adventures of a French refugee from Mauritius who earned a precarious living as a teacher in New England in the early part of the last century. "Topliff's Travels," the second of these publications, consists of private letters descriptive of a pleasure trip in Europe in 1828-29—a rare thing in days when it was almost wholly for business reasons that men crossed the Atlantic. The author, Samuel Topliff, was the proprietor of a Merchants' Reading Room, the first establishment of the kind in the country, where the latest ship news, letters from correspondents in foreign cities and newspapers could be found. His letters are full of information about the places visited and also are enlivened by humorous touches.

After a short stay in England he went to Ireland, and then to Scotland. Passing through Abbotsford, he sought an interview with Sir Walter Scott. In reply he received a polite note of regret, which wishes "Mr. T. an agreeable journey and assures him he has no reason to regret that his curiosity has not been gratified as he would only have seen a very plain old man." One of Topliff's "general observations" about Holland was that "a four-pronged silver fork is used almost altogether—the knife being used to cut with, but not to convey food to the mouth."

But the most interesting episode of his tour, which included the Rhine, Switzerland, Rome, and Paris, was his visit to Lafayette at his chateau Lagrange. His graphic account of his host, his many proofs of Lafayette's attachment to America, justify alone the publication of the letters:

> In the General's chamber, were Portraits and engravings of several American worthies, among them Genl. Jackson, and two drawings, executed and presented by Mrs. Quincy—one represents Govr. Hancock's house; the other Mr. Quincy's house in Quincy, from which Boston with its State house, church spires, etc., is seen in the distance; and in short every room in the Chateau, as I was informed, contained some memorial of America.

In a letter written from Paris a few months later we find the following observation from one of Topliff's last interviews with Lafayette:

> He appears to know everything that transpires in America, and to take as much interest in the arrival of the packets at Havre as a person engaged in commercial affairs, and he receives regularly by all of them the *North American Review*, and other works, newspapers, letters, etc., which enables him to know what is going on in America, almost as well as if in the country.

Illustrations, facsimiles, maps, and a very full index add to the interest and value of the book.

Peter Rosegger. Ein Charakterbild von Theodor Kappstein. Stuttgart; Greiner & Pfeifer.

There are German writers now living whose poetry has more grace and subtlety, whose fiction is better constructed and finished, and whose reading of life is more profound; but there is no man among them who, for simple, wholesome humanity, can compare with the Austrian, whose name is not only a household word in the humblest homes of his native Steiermark, but whose works are read throughout the world. This book is written by one who with honest enthusiasm has traced the development of his hero not only in his books, but among the people of his native province. The work has the flavor of the soil and the atmosphere of a *plein air* portrait.

In passages from Rosegger's writings which tell his early life in his own words, the figure of the *Waldbauerbub*—the forest peasant's boy—stands out like the image in a mirror. Gifted with a rare imagination, the child lived in the humble home as in a fairy kingdom; he built churches and castles out of paper, played wonderful tunes on the bottom of a keg strung with twine, and painted images of saints with a brush made of his own hair. At night, when the children were put to bed, he told the others stories until they fell asleep. In the daytime he talked with all the shepherds, wood-cutters, colliers, and grandmothers of the countryside, until their rich store of native lore became his own. Upon this fund of quaint beliefs, fancies, and legends he continued to draw long after he had begun to tell his stories to the grown-ups of the world. He began to write while apprenticed to the village tailor. As the acknowledged scribe of the community, he was busy composing letters and poems for his neighbors; and he whiled away the long winter nights by writing almanachs, sermons, plays, stories, and verse of every description. Lending themselves easily to popular tunes, the poems were soon sung in the neighborhood. Finally, he was so warmly encouraged to publish them, that a relative took a basketful of manuscripts—Rosegger naïvely reports that they weighed 115 pounds—to the editor of the *Grazer Tagespost*, Dr. Svoboda, who became interested in his talent. Through him the boy received books and was enabled to enter a school, where he attracted attention not only through his writings, but also the crude yet striking illustrations which he added.

While at this school Rosegger found a friend in the scientist Rudolf Falb, and soon after was taken up by leading literary men of Austria, like Schloegl, Silberstein, Vacano, and Anzengruber. Whatever differences of birth and breeding, taste and opinion, separated them, they were unanimous in their esteem of Rosegger's genial humor and radiant idealism. He had his limitations; the brilliant flashlight of Heine's genius was lost upon him; but it must be emphasized that his disapproval of Heine was not founded upon racial prejudice, for one of his closest friends was Berthold Auerbach. Nor is there a trace of religious intolerance in Rosegger.

The author of the biography is not blind to some peculiarities of his hero, arising from his desultory education. Rosegger has confessed in "Mein Weltleben" that he had gained little from books, that he did not know some of the treasures of the world's literature like Homer and Dante, that he was unfamiliar with Byron, Scott, and Voltaire, and even with Jean Paul and other German writers, and had been unable to read "Wilhelm Meister" to the end. He says: "In this respect, too, I am but a peasant, who can get his nourishment only from his own acres." Of music he admitted knowing nothing but the folksongs, yet he invented tunes to many of his poems which in his neighborhood are sung by the peasants.

There are few problems of modern life that he has not touched upon in his writings. Notwithstanding his religious tolerance and moral latitude, he warned against the influence of Darwin and Nietzsche in his "Weltgift"; he preached return to the soil in "Erdsegen." Though it is easy to detect flaws of construction and taste in not a few of his stories, among them the famous Christ story, "I. N. R. I.," the strength and simplicity, the wholesome humor, and the mature wisdom of this self-made philoso-

pher and poet give his writings a unique charm.

Through Man to God. By George A. Gordon. Boston: Houghton, Mifflin & Co. $1.50 net.

A volume of sermons from the foremost pulpit of Congregational New England challenges the thoughtful reader to a larger undertaking than a mere estimate of the intrinsic worth of the particular book. Mather and Edwards, Hopkins and Taylor, Park and Bushnell range themselves in the background, while a host of other giants scarcely less towering crowd beside them and demand to know whether the traditions of the New England pulpit have been upheld. New England preaching is Puritan in type, which means that it is didactic, dogmatic, and in a measure apologetic. It is based upon the conviction that the Bible contains an articulated system of thought, which can be deduced by rules of logic, and formulated in catechisms and confessions. The function of preaching is accordingly to set forth this theology in terms adapted to plain minds, with proof drawn from Scripture and with application to the lives of the faithful. Thus the New England sermon has been chiefly doctrinal, with appeal to the reason, and in the hands of masters has tended to be a "great sermon," the declaration of extensive truth, with elevation in thought and style.

It may be said at once that in seriousness of purpose, in professional self-respect, in dignity of undertaking, Dr. Gordon has not violated the canons of the worthy order to which he belongs. To begin with, his sermons are not short, or lightened with anecdote. They respect the hearer enough to assume that he desires a gravely reasoned discourse, which makes some drafts upon the powers of attention and thought, and which follows its subject to a conclusion. Dr. Gordon has addressed himself to people who think, or who think they want to think, which is much the same thing in its bearing upon the gravity of discourse. Despite addiction to the short sentence and consequent monotony, and despite divergence from traditional Puritan theology, he has remained true to the exalted ideals of his fathers.

One finds also in this volume suggestion of a "body of divinity," a carefully reasoned system of truth, which the Puritan divine believed it his duty to work out. In fact, Dr. Gordon speaks of his "philosophy of existence," and declares that the fundamental idea in it is "the incarnation of God in Jesus the perfect man, in all men as moral beings, in all good men as the life of their life." The heart of the Gospel he announces in the sentence, "The supreme path of God is through the humanity of Jesus: the perfect humanity of Jesus supplies the ideal path." In more than one sermon the declaration is repeated that Jesus is the interpretation and law of the universe, that the soul of all things found utterance in him, and he is therefore the manifestation of the mind and heart that is in all and through all. This is a worthy theology, but it is as old as the Fourth Gospel, and it found its classic statement in the Greek fathers. Dr. Gordon can hardly be said to have added to it, nor to have given to its expression any new elements of truth or beauty.

New England has had saints who have dared to find their way alone towards heaven, who have spoken boldly truths of the spirit which they acquired in solitude, without mediation. Jonathan Edwards was one of these, and there are verses of Whittier which testify that the succession has come down almost to our own time. For this ardent self-reliant piety one looks in vain in these Old South sermons. This prophet has not walked alone under the stars, nor did the burning coal touch his lips when he was alone in the temple: he only knows of a prophet who was anointed to tell the truth, and through whom he has received gracious divine revelation. He has gone through man to God, but the faith of the mystic who abides in God, the faith of Northampton's seer, he has not discovered.

In an eloquent plea for accuracy Dr. Gordon speaks of "the sentence passed upon the London publisher who issued the Bible with the negatives left out in the Ten Commandments. His work was destroyed and he was sent to the Tower, not only for sacrilege, but also for inaccuracy." It is fortunate that Boston has no Tower, for Dr. Gordon is evidently thinking of Robert Barker's Bible of 1631, in which "not" was omitted from the seventh commandment, for which Laud's High Commission fined him £300.

Queen Louisa of Prussia. By Mary Maxwell Moffat. New York: E. P. Dutton & Co. $3.

Twenty-four years have elapsed since the appearance of an authentic German review of Louisa's life, and this new memorial of Germany's most popular woman is timely, coming as it does near the anniversary of the battle of Jena. The volume is popular in plan, and with its twenty or more illustrations, is likely to prove very attractive to the average reader. But there is also a good deal of new matter not found in Horn or even Lonke; there are abundant abstracts from her recently disclosed correspondence, and there are several useful genealogical tables. There is, too, a good index, and a fair bibliography, though it lacks any mention of Martin's German biography (1887), and is wholly deficient in American references, even to such a well-illustrated and popular work as Prof. W. M. Sloane's "Napoleon."

The Queen's private life is set forth in glowing color. We see her a modest but spirited girl, tripping through the streets to a ball after her grandmother's carriage, when the irate old lady would no longer wait for her; and never losing her head when she and her sister became engaged to the Crown Prince of Prussia and his brother, and her lover discovered that she was "as beautiful as an angel." Her beauty, inherited from the Hesse-Darmstadt branch of the family, appears, indeed, to have been all that was ever claimed for it, inducing Goethe to secrete himself in a neighboring tent, when Louisa came to visit her future husband in camp, in order the better to enjoy her features. She was well educated in the things that a girl was taught in those days, playing early on the piano when it was beginning to supplant the harpsichord. With her husband she preferred the plain life of the country cottage and the quiet hours together when they might say *Du* to each other and could enjoy their friends. These included in the political world, for years at least, Alexander, Czar of Russia, and in literary circles Schiller, her favorite poet, and Richter, her favorite prose writer. Goethe, on the other hand, she does not appear to have known well. All her life Louisa interested herself in charitable work, as a girl taking thought for the poor tenants on their estate, as a Queen visiting the poor in Berlin. The change of political events, brought about by Napoleon, reduced her to abject poverty, to the like of which probably no modern queen was ever subjected. The future first Emperor of Germany was born under humiliating circumstances, while she was "living on air," and she was soon forced to beg her brother to send a baby's cap to replace the rag on his head. Yet, despite all this, she never lost her faith, and persisted in her efforts to encourage the King, reminding him that loss of territory is as nothing compared with the loss of liberty, and declaring that she was ready to live on bread and salt, or even die, for "the future of mankind, the welfare of the world, the happiness and independence of unborn generations."

Incidentally Miss Moffat portrays the King, a youth naturally vivacious, but spoiled by a hypochondriacal tutor. He learned to value his wife first through a severe sickness, so that later in life she could write: "The King is kinder and more considerate than ever, and often it seems to me as if my lover and bridegroom had come back."

Naturally, the most interesting single topic treated is the meeting of Louisa with Napoleon. More might have been said of her retreat to Weimar when Hohenlohe and the Duke of Brunswick failed to beat back the French, and she was forced by Napoleon to play hostess to him; but there are some new facts concerning the meetings on the raft at Tilsit, when Napoleon browbeat the King of Prussia and mingled raillery, flippancy, and haughtiness in his discussion with Louisa of political affairs. Probably Miss Moffat is right in ascribing to Burke and Carlyle Marie Antoinette's good fortune in becoming better known to the world than Louisa, notwithstanding the latter's ability, even in public affairs; but the fact that Marie played before the municipal footlights of Paris while Louisa appeared on the great Continental stage when there was but one overshadowing actor in all Europe, had also much to do with the fate of her fame. Destined, rather than her husband, to supplement the work of Frederick the Great, Louisa became the real power behind the throne, and was soon recognized as their best ally by reforming statesmen. Her prophecy of the downfall of Napoleon shows her political sagacity:

> I do not believe that Napoleon Bonaparte is firmly and immovably seated on that splendid throne of his. Stability proceeds from truth and justice, but he has no thought of furthering noble ends or benefitting his fellow men. Many will admire him, but few will have any affection for him. He has ceased to exercise moderation, and the man who cannot hold a middle course is sure to lose his balance and come to the ground.

Her wisdom is also shown in her perception of the value of *Deutsche Einheit*: "I am

fully persuaded that the one and only means of deliverance is the close union of all who bear the name of German."

Science.

The Non-Christian Tribes of Northern Luzon. By Dean C. Worcester. 72 half-tone plates. Manila: Government Printing Bureau. (Reprinted from *Philippine Journal of Science*, Vol. I., No. 8.)

This is the latest, and to date the most authoritative, discussion of the mountain peoples of Northern Luzon as a whole; that is, not a detailed study of any one community, but a comprehensive view and attempt at classification of all. Professor Worcester, as secretary of the interior in the Philippine Government, has charge both of the ethnological study and the government of the wild peoples. He has made many trips, some of them heartbreaking "hikes," on occasions also incurring serious danger in regions previously unexplored. His activity will be apparent to any one who will follow on a map the record given in this paper, or who will observe that one-half of the 200 accompanying photographs were taken by Professor Worcester himself.

There has been considerable discussion recently of certain "authorities" on the Philippines, and some students who have relied on Ferdinand Blumentritt's statements have been surprised to learn that the Bohemian academy teacher was never in the islands about which he wrote so voluminously for a score of years, and that his writings are very inaccurate. Blumentritt listed thirty-six wild tribes in Northern Luzon, and the Jesuit fathers (in their "scientific review" for the first Philippine Commission) twenty-six. Dr. Barrows, formerly chief of the Philippine Ethnological Survey, but now at the head of the Philippine schools, calls all the Malay hill-peoples of Northern Luzon Igorots, recognizing otherwise only the Negritos and the Malay-Negrito mixtures. Professor Worcester will not go quite so far as to consolidate Blumentritt's and the Jesuits' confused lists of tribes into one only, but he agrees with Barrows in rejecting the previous lists as entirely unscientific; he recognizes six Northern Luzon tribes besides the Negritos: the Ilongots or Ibilaos, the Kalingas, the Ifugaos, the Bontoc Igorots, the Lepanto-Benguet Igorots, and the Tingians. An excellent test of Blumentritt's methods is afforded in his treatment of the wild people of the province of Nueva Vizcaya. He catalogued fifteen tribes (and the Jesuits seventeen). Professor Worcester says:

> There are but three non-Christian peoples in the province, viz., the Ilongots, the Ifugaos, and the Isinays (few in number and probably only a dialect-group). Of the remaining tribal designations employed by Blumentritt, Ibilaos and Italones are synonyms of Ilongots; Alimut and Ilamut are synonyms; and the Bungananes or Bunnayanes, Mayoyaos, Quianganes, and Silipanes are all Ifugaos, to whom the names of their *rancherías* (or in the case of the Alimut, the name of their river-valley) have been applied as tribal designations. The Altasanes, Ifumangies, Ileabanes, and Panuipuyes do not exist. In all probability these latter names were taken from those of *rancherías* which have long since disappeared.

Professor Worcester thus explains why Blumentritt's writings on Philippine ethnology and ethnography have only created confusion:

> He is a compiler, pure and simple, and in preparing his list of Philippine tribes has been compelled to follow, more or less blindly, the persons from whom he has derived his information. After nearly four centuries of Spanish occupation and rule, extensive areas in northern Luzon remained entirely unexplored at the time of the American occupation, and . . . the alleged facts as to the inhabitants of this region were necessarily hearsay when they reached the Spaniards, and second-hand hearsay when they reached Professor Blumentritt.

The truth is, the scientific study of Philippine ethnology is only now beginning, under the American Government in the Philippines. Such writings as this paper under review, the annual reports of Dr. Barrows and his survey of the subject in the Philippine Census show how tentative must still be the general conclusions. But the field work already done is enough to dispose of the rumors about extensive mixture of Chinese, Japanese, or even Caucasian blood with the Malay in the Philippines, and to point to the underlying racial unity of the people. Meanwhile, Dr. Saleeby has brought out material hitherto unavailable about the Moros, and Dr. Jenks has made the first really thorough ethnological study ever made in the Philippines, in his *Bontoc Igorot*. Professor Worcester points out our lack as yet of detailed studies of these various mountain communities, and publishes his views only to help "awaken interest" and to stimulate thus the study needed either "to verify or to correct" such conclusions as he has ventured. Incidentally, it may be suggested that the study of northern Luzon dialects, lack of knowledge of which has resulted thus far in their being practically left out of consideration, may prove of considerable importance in classifying these hill peoples.

Readers of the works of Haeckel will find little that is new in his "Last Words on Evolution" (New York: P. Eckler), three lectures delivered in 1905 at Berlin, and declared by the author to be his last public addresses. Others may be glad to have this brief, often bald, but quite characteristic statement of his views, including a particularly bare outline of monistic philosophy. The translation is by Joseph McCabe, and for the most part adequate. The presentation of the subject is marred by a controversial treatment of the work of Wasmann and by an unnecessarily harsh arraignment of Virchow on account of his attitude toward evolutionary questions. To the general, this display of the sledge-hammer method of argument may be attractive; the judicious will grieve, and agree with the writer of the Books of the Maccabees that "speech finely framed delighteth the ears of them that read the story."

All persons who have visited the Pitt-Rivers Museum in Oxford and all students of human history will be interested in the collection of the late Gen. Pitt-Rivers's essays edited by J. L. Myres under the title "The Evolution of Culture and Other Essays" (Henry Frowde), with an Introduction by Henry Balfour. In these papers the founder of the Museum describes his method of investigating the evolution of material arts, particularly in weapons of warfare and means of navigation. His data and his method are both of them instructive.

"Chimæroid Fishes and their Development," by Bashford Dean, is issued as Publication No. 32, of the Carnegie Institution of Washington. For a number of years Professor Dean has enlisted the services of the Chinese fishers on the California coast in gathering the eggs of the Pacific rat-fish *Chimæra collei*, and by incubating them in submerged floats has obtained a series of these unique embryos. The present monograph on their development reveals Professor Dean's ability both in exposition of embryological research and in exquisite color illustration. The most important conclusion reached is that these holocephalus shark-like fishes, instead of being among the most primitive vertebrates, as has been the consensus of opinion heretofore, are widely modified and extremely specialized forms; this interpretation being strengthened by the evidences of anatomy, embryology, and palæontology.

"An Investigation of Evolution in Chrysomelid Beetles of the Genus Leptinotarsa," by Prof. W. L. Tower, is the title of Publication No. 48 of the Carnegie Institution of Washington. Probably no group of insects has received such thorough monographic treatment from the point of view of ecology and evolution as Professor Tower has given the genus *Leptinotarsa* in this beautifully illustrated volume. This genus embraces forty-three species, of which the best known is the common potato beetle. Starting with the distribution of the group, Professor Tower passes to individual variation in color pattern, size, and shape; he discusses the structure, ontogeny, and phylogeny of coloration in these and other insects; experimental modification of the colors and the significance of the various hues and patterns, both in the larvæ and adults; the normal habits and instincts of these beetles; details of interesting selection experiments in breeding and the production of new races; and a final chapter on the relation of all the results obtained to the problem of the origin of species. Professor Tower believes that somatic variations produced by external stimuli are not factors in evolution. The thoroughness of the work and the clearness of exposition inspire confidence in the results and conclusions. It is a valuable contribution to the literature of evolution; and based as it is upon a combination of field observation and experimental research, is an adumbration of the scientific work of the future.

Major Powell-Cotton has just returned from a twenty-seven months' journey in Central Africa, the scientific results of which are very valuable. In addition to a white rhinoceros, he secured six species of forest animals previously unknown to science. He did not see a live okapi, but obtained a skin and complete skeleton of an adult male. Many months were spent with the pygmies of the great Ituri Forest, of whose language he obtained phonographic records. On Lake Albert Edward a tribe was discovered who spend their whole lives on the water, their houses being built on floating platforms, anchored to long poles.

Professor Brunon of the Medical School of Rouen has obtained noteworthy results from an easy open-air treatment applied to one hundred cases of pulmonary tuberculosis among children from two to sixteen years of age. The observations cover a period of five years from 1901 to 1905; the children were all treated in the regular Hospice Général of the city, the length of the treatment varying from one month to two years. The children pass the day and take their meals in open-air galleries forming a hospital "Aerium." The treatment goes on in all seasons and all weathers, from eight o'clock in the morning to four in the evening in winter and from six in the morning to eight in the evening in summer. During the night the children are placed in common halls, but some of the windows of these halls are kept constantly open, no matter what the season or weather or degree of night temperature. The cleanliness of these halls is obtained by very severe discipline. Floor, walls, and furniture are wiped every day with damp cloths. The children are obliged to maintain strict bodily cleanliness. The report adds:

We do not subject these little patients to intensive diet (*suralimentation*); they have the food of the hospital ward, supplemented by raw meat and foods preserved in oil; in general, little cooked meat, much starch food and cooked fruit, and water to drink. We are led to believe that water given to drink habitually increases the appetite, helps digestion, and causes the patient to gain in weight.

The final report of the geological exploration of the French Sahara, from Alger to Timbuctoo, has been presented by M. Chudeau to the Société de Géographie of Paris. Only two notable gaps now remain in our knowledge of this vast region. One is the Atlantic stretch between Senegal and Morocco; the other, the inland territories to the east of the Tchad. The latter is still a district of the slave trade. Not France alone, but England and civilization are interested in the opening up of this unknown land.

Capt. Roald Amundsen gave an account of his expedition to the North Magnetic Pole and through the Northwest Passage at the February meeting of the Royal Geographical Society. It was largely taken up with a description of the magnetic observations, which, with the meteorological, were "kept going day and night without interruption for nineteen months." By these and by excursions to parts of the country adjacent to their headquarters "he succeeded by the help of declination in absolutely proving what of late had been assumed on theoretic grounds—namely, that the magnetic pole had not an immovable and stationary situation, but in all probability was in continual movement." Much light will be thrown upon the manner in which this movement took place when the observations are worked out.

Petermann's Mitteilungen, No. 1, contains, as its only article, an account of Alaska by Dr. Alfred Rühl, which is a résumé of the facts given by A. H. Brooks in a "Professional Paper" recently published by the United States Geological Survey. The material is grouped under the headings of coasts, the four great geographical provinces, the hydrography, climate, and geology. It is accompanied by an admirable colored map, founded on that of Barnard, with additions, and three insets, showing the geological formation, the distribution of vegetation, and the extent of the glaciers and snow fields in the Ice Age.

In the current issue, No. 592, of the *Astronomical Journal*, Prof. Simon Newcomb presents a summary of his extended memoir about to be published, "The Action of the Planets on the Moon." The work, carried through under the auspices of the Carnegie Institution, and with the aid of Dr. Frank E. Ross, is regarded by Professor Newcomb as a continuation and practical completion of his contribution to the same subject, issued in 1894 as one of the Astronomical Papers of the "American Ephemeris." His theme is treated under eight headings, in each of which he gives a concise summary of his determinations. Other papers in the *Journal* are observations of comets at the Cincinnati Observatory and at Carleton College, observations of the satellites of Saturn at the Naval Observatory at Washington, and of a suspected variable star at the Yerkes Observatory.

The Villauri prize of 28,000 francs will be awarded by the Turin Royal Academy of Sciences to the scholar who publishes the most important work in physical science before the last day of 1910.

Professor Wilhelm von Bezold, director of the Royal Prussian Meteorological Institute, has just died at the age of sixty-nine.

The death is announced of Marcel Bertrand, member of the French Institute, and an eminent geologist. He was born in 1847. Among his works are "Panama et les Phénomènes volcaniques," and "La Formation du Continent européen."

Drama.

"THE MERCHANT OF VENICE" BY THE BEN GREET COMPANY.

The so-called Elizabethan performances of Ben Greet are less important, perhaps, for their actual achievements than for the lessons which they convey. They are given, of course, under what might seem at first sight to be serious disadvantages. There being no large amount of capital behind them, they are not extensively advertised; they offer no popular star for public adoration, are devoid of spectacular attraction, and make their chief appeal to the intelligence. They are caviare to the general. The fact, therefore, that they have prospered for so long is a proof that there is a large intelligent class to support them, in the face of much formidable opposition. Mr. Greet rarely has any players of distinction, for the simple reason that he cannot keep them. His is one of the few veritable stock companies in existence, and consequently one of the best schools of acting to be found anywhere. Naturally his young players as soon as they have learned their business under his capable supervision seek for more lucrative employment elsewhere.

His present company, with which he gave a performance of "The Merchant of Venice" in the Garden Theatre on Monday evening, is plainly composed very largely of novices—whose speech and manner constantly betrayed them—and yet the representation as a whole was remarkably smooth, vivacious, and interesting, delightfully free from those intervals of sheer collapse which are so frequent in the ordinary star Shakespearean drama. All the actors supported each other loyally and with a mutual intelligence and sympathy very pleasant to see. They spoke their lines not always with much elocutionary skill, but with clear comprehension of their meaning, and generally with appropriate and natural gestures. Some valuable points were missed here and there, but the spirit of the comedy was, in the main, well preserved. Some of the individual performances were uncommonly good. Among them may be mentioned the Antonio, who was dignified, tender, and pathetic without being in the least a prig; the Bassanio, a well-spoken gentleman and agreeable lover; the Gratiano, the Duke, the Princes of Arragon and Morocco—but, indeed, the whole list was commendable. A special word of praise is due to the Portia, an exceedingly capable, graceful, and spirited assumption which shone especially in the trial scene. Ben Greet's Shylock is tolerably well known here. It is red-headed and comic, not always realistic, but never touched by idealism. Unquestionably it has a certain amount of traditional authority on its side and much cleverness as well, but it will never be popular among the admirers of Booth, Irving, or Possart. It fits well, however, in the Shakespearean picture, and it is scarcely too much to say that this representation, with its full text and practically no scenery, gives a more correct view of the play than any of the abbreviated, spectacular productions.

George Broadhurst has not improved his budding reputation as a serious dramatist by "The Mills of the Gods," produced on Monday evening in the Astor Theatre. This piece deals with no particular social condition, or movement, or problem, and depends upon no conflict of character, but is an ordinary melodrama of situation and coincidence, with the usual sentimental, sensational, and realistic attachments. It tells the tale of a devoted and virtuous brother, who steals (when he might just as well have borrowed) for the sake of a dying sister; he is convicted and sent to jail, and afterwards builds up a fortune, only to be blackmailed by an accomplice whom he finally tries to kill. At last he is rescued from his troubles by a free pardon, a fit ending to a most conventional plot. Even as melodrama the play is not well made, but a court scene in the first act is veracious in detail, and there is a "thrilling" midnight encounter between the hero and his persecutor. On these two episodes the fate of the performance depends. Whether it prospers or not it fulfils none of the expectations excited by "The Man of the Hour."

There is mourning among the theatrical reformers of Chicago over the demise of the New Theatre, a calamity which was foreseen by the experienced from the very first. The ideal theatre is a matter of growth not of establishment. Any attempt to create it by means of a moderate sum of money, an inexperienced man-

ager and a scratch company was foredoomed from the start. The Chicago enthusiasts, it seems, had no plays, plans, or performers. The only piece of real importance which they put on, badly, was the "El Gran Galeoto" of Echegary, and that, of course, had been well done in New York. "Le Gendre de M. Poirier" is an excellent comedy that was popular thirty years ago. Herne's "Margaret Fleming" never had the significance claimed for it by a handful of its admirers. There was no reason why an endowed theatre should be built for the perpetuation of pieces of this sort. But it has been the destiny thus far of almost every independent theatre here, in England, or in Europe, to be devoted to trivial, fantastically impossible, or unclean plays. Nothing has come out of them within the last twenty-five years in the least worth preservation. But the experiments continue. Soon, it is announced, Chicago is to have its ideal Players' Theatre. May it do better than any of its predecessors.

A dramatization of Rex Beach's novel, "The Spoilers," will be presented at the New York Theatre, March 11.

Beerbohm Tree is perfecting the arrangements for his Berlin visit. He will appear in "Richard II.," "The Merry Wives of Windsor," "The Man Who Was," "Hamlet," "Twelfth Night," "Trilby," and "Antony and Cleopatra."

There has been a revival of John Bale's old morality play, "King John," at Ipswich in England. This is among the earliest dramatic works in which actual historical characters were introduced.

Music.

Opera Singers. By Gustav Kobbé. Boston: Oliver Ditson Co.

Nowhere in the world is there such a cult of the opera singer as in New York. Most of the famous vocalists of both continents are here during our four months' season, and they get more attention from the newspapers than perhaps any other class of persons engaged in harmless pursuits. Mr. Kobbé was therefore well advised in devoting a volume to them. It is intended primarily as a pictorial souvenir. There are 139 costume portraits, 27 of which are full-page. They include some artists who have abandoned the stage—among them Lilli Lehmann and Jean de Reszke—but for the most part the portraits are those of singers who still visit us annually. The latest favorite, Miss Geraldine Farrar, is pictured five times, in the rôles of Mignon, Marguerite, and Juliet. The new singers imported by Oscar Hammerstein are also pictured. Of ten of the artists—Calvé, Caruso, Eames, Melba, Nordica, Schumann-Heink, Sembrich, Ternina, Jean and Edouard de Reszke—there are biographic sketches, which may be regarded as reliable inasmuch as the data for them were supplied by the singers themselves.

The notion that singers come chiefly from the south is not upheld by facts. Sweden contributed Jenny Lind and Christine Nilsson, and in our own country Maine leads with Annie Louise Carey, Emma Eames, and Lillian Nordica. Emma Eames, to be sure, was born in China, but her family home was in Maine. Lillian Nordica narrowly escaped falling a victim to New England Puritan prejudices. Her grandfather would not allow his son to bring a violin into the house. Her father and mother sang—in church, the only place where it was not considered sinful to do so. When she went on the stage she received letters from home begging her not to disgrace her family name by dragging it into the theatre; so she gave up Norton and called herself Nordica. Mme. Melba's real name was Nellie Mitchell. Apart from these two cases, one is struck by the fact that the once general custom of assuming a stage name has practically gone out.

The attention of the thousands of young women who scorn home life and fancy that prima donnas live in an earthly paradise may be called to several pages in Mr. Kobbé's book which convey a different impression. Mme. Ternina "has attained much. There is even a Ternina cult. Yet she is unhappy," because she feels that she has never been able to reach her ideals. According to Mme. Sembrich, "an operatic career is a fine thing, but an opera-singer really doesn't 'live,' and if it were not for a few minutes' joy when you hear thousands applauding, there would be little tempting in the career. . . . If one only could always end a performance and never begin it." Mme. Nordica speaks of the agonies experienced during a performance; even under the most favorable circumstances "there are awful moments." Mme. Calvé has given her testimony to the fact that even the most successful career as an opera singer does not atone for the loss of family life; while Jean de Reszke often spoke of the fact that devotion to duty practically made slaves of himself and his brother.

Walter Damrosch will increase the New York Symphony Orchestra to 102 players for the final concerts of this season's series to be given at Carnegie Hall on Saturday evening, March 9, and Sunday afternoon, March 10. Richard Strauss's fantastic "Till Eulenspiegel," one of the principal numbers on the programme, demands such a large apparatus for performance.

The death of Sir August Manns, announced from London last Saturday, removes an eminent and respected figure from the English musical world. It would be difficult to exaggerate the value of the missionary work which he did, in the popularization of good music, during the long years of his courageous and indefatigable public service. Although his name was not so familiar beyond the limits of Great Britain as those of some other conductors of his period—Sir Charles Hallé, Sir Michael Costa, and Alfred Mellon, for instance—his labors, so far as the great multitude is concerned, were, perhaps, more influential and beneficial than theirs collectively, for the simple reason that he appealed to far larger audiences. For nearly half a century he organized and conducted all the concerts at the Crystal Palace at Sydenham, and his programmes included much that was best in the whole range of orchestral music, ancient and modern. As a conductor he was sound rather than brilliant, but his taste was comprehensive and sure, his knowledge of instrumental capacity profound, and his control over his musicians absolute. He made his orchestra one of the best in the United Kingdom. August Manns, born of poor parents near Stettin, Germany, March, 1825, displayed natural aptitude as a musician almost before he could walk or talk. As an infant prodigy he played the flute in the village band. Service in a military band brought him to the attention of Wieprecht, the inspector-general of military music, who promptly transferred him to Gungl's orchestra in Berlin. After considerable successes he resolved to seek his fortune in England. In the spring of 1854 he attracted attention as sub-conductor of the wind band at the then new Crystal Palace. Eighteen months later, after brief seasons at Leamington, Edinburgh, and Amsterdam, he finally accepted the appointment of musical director at Sydenham; and began the popular Saturday concerts, which in the course of time came to be regarded almost as a national institution. The fame of Sir August Manns—he received his knighthood in 1904, after fifty years of almost uninterrupted musical labor—was inseparably connected with the Crystal Palace. He conducted occasionally in London and other cities, and sometimes paid professional visits to the Continent, but it was beneath the crystal dome of the vast building at Sydenham that he built up an almost unique reputation as an equally capable interpreter of either popular or classical music, and an enthusiastic pioneer in every direction of musical development. He was a great admirer of Schumann, and did more than any other one man, perhaps, to make the works of that composer widely known in Great Britain. During his long career he was the recipient of many honors, and enjoyed the friendship of many illustrious composers. In 1882 there was a great demonstration in recognition of his work.

Vernon Blackburn, musical critic of the *Pall Mall Gazette*, is dead, at the age of forty-two. After taking his bachelor's degree at London University he "attempted a religious career, with dire failure"—to use his own words. For a time he was on the staff of the *National Observer*, under W. E. Henley. His books are "The Fringe of an Art" and "Bayreuth and Munich."

Art.

Correggio. By T. Sturge Moore. 56 illustrations. Imported by Charles Scribner's Sons. New York. $2 net.

"Correggio," by T. Sturge Moore, more than bears out the excellent reputation of the red-covered artist biographies published by Duckworth in England and imported by the Scribners. The style is occasionally crabbed, its discursiveness extreme, but as the sincere effort of a poet's mind to interpret a most poetical painter it abounds in wisdom even in the byways of the theme. Mr. Moore is a poet of the *Parnassien* type, and his thinking is compact, as a critic, even when his rhetoric is diffuse. The originality of the book lies largely in the asides, though the author does good service in challenging previous vague attempts to define the peculiar sort of ecstasy wherein Correggio's Correggiosity must surely consist. Mr. Moore's own view is that the master fully realized him-

self only in a handful of the classical pictures, notably the Io, the Ganymede, and perhaps the Antiope. As the favored decorator of the provincial and by no means highly cultured court of Parma, Correggio lacked the sustaining forces behind a Titian or a Michelangelo, frequently availing himself too readily of his own formulas, seldom realizing the full dignity of his position as artist. He is to be classed with the nostalgic souls, who neither profit by surroundings nor dominate them, and his mastery accordingly is perhaps the most individual of any the painter's art can show. Reynolds, Mr. Moore holds, has done fullest justice to Correggio's prodigious tecbnical merit—in particular, to that "fulness of effect" in chiaroscuro which establishes a bond with that otherwise wholly alien genius, Rembrandt. Mr. Moore's adherence to Reynolds may serve as an index to the sanity and enthusiasm that underlie the occasional asperities of his discourse.

Though the book makes no pretensions to connoisseurship, it is adequate on that side. It omits in the lists a drawing, in the Metropolitan Museum, for the four balf-concealed *putti* in the pendentives of St. Giovanni Evangelista, Parma, and one in the Yale Art School at New Haven. It also reproduces casually (plate 19)—the author has not seen the picture—what is likely to be a mere copy of the Naples "Marriage of St. Catherine," for no better reason apparently than that the picture is in the famous collection at Alnwick. In the main, we feel that Mr. Moore's judgment on the disputed pictures, such as the Ganymede, is likely to prevail over the skepticism of Ricci and others. We must close with an extract that will convey something of tbe quality of the work. Speaking of tbe classical myths, tbe author enlarges on the tbeme, and says:

That precious pedant who says, "This belongs to a thousand years ago; away with it! let me not contaminate my pure thought, my pure sense of beauty, with it!" forgets, poor dullard that he is, that every word he utters is a tbing of a thousand years ago, and with roots in a yet more distant past. He forgets, or is incapable of feeling, how every sentiment that softens, thrills, or exhilarates his life, has grown and been transformed (or, if he will, adulterated), age after age, until it reached his mother in all its inexplicable complexity. . . . How wretched is that artist who sees with his eyes alone, whose mind colors nothing with remembered glory, whose heart softens nothing with reflected sentiment, whose blood makes nothing throb or tingle with infectious fire and energy. . . . Whitman was one-eared, Monet one-eyed, Zola half-hearted, Nietzsche half-souled.

Signor Rava, Italian minister of public instruction, has decided that the excavations at Herculaneum sball be carried out by the Italian Government, with Italian money and without foreign aid, "although gratefully taking into account the advice of eminent foreigners, such as Prof. Charles Waldstein of New York and Cambridge, England."

The Pennsylvania Academy of Fine Arts will bave on view until March 23 an exhibition of paintings by Marla Oakey Dewing, of wood engravings by Timotby Cole, and of landscapes in oil by Ernest Lawson.

The Groller Club will exhibit from March 8 to March 23, medals and placques by Victor D. Brenner.

Among the dealers' shows in this city are paintings by Charles H. Davis at Macbeth's till March 9, and eigbteenth-century pictures of the French and English schools at K. J. Collins's.

The will of the late Stephen Salisbury of Worcester, Mass., which bequeathed property valued at between $2,000,000 and $3,500,000 to the Worcester Art Museum, founded by Mr. Salisbury, has been sustained by the Massachusetts Supreme Court.

Julius Hasselblatt, tbe Berlin art critic, has died at the age of fifty-eight. Under tbe name G. Norden be contributed to various newspapers and magazines. Among his other works is "Historischer Überblick über die Kaiserlich-Russische Akademie der Künste."

At the auction of Georges Viau's paintings in Paris on Monday, the following prices were paid: Monet, Glaçons au Crépuscule, $3,520; Morisoto, Jeune Fille, $2,500; Sisley, Inondation, $2,000; Port Marly, $3,250; Degas, Famille Mante, $4,500; Danseuses à Foyer, $3,220; Manet, Madame Guillemet, $2,400; Renoir, Tonnelle, $5,200; Ingénue, $5,820; Daumier, Le Drame, $5,620; Cassatt, Maternité, $2,260.

At an auction at Christie's, London, February 16, tbe following pictures were sold. Briton Rivière, Actæon, £325; G. F. Watts, Dawn, £598. At an auction on February 19 the sum of £136 was paid for an engraving by T. Watson, after Reynolds's Lady Bampfylde.

Finance.

"FORECASTS" BY A STOCK MARKET.

The rapid decline in Stock Exchange prices, during the last two weeks of December and the month of January, started anxious discussion as to whether the weakness foreshadowed reaction in general trade. When stocks recovered briskly, in tbe first two weeks of February, predictions of industrial relapse were less frequent. The renewed break in prices, within the past week, has in the same way revived the old misgivings. It is noticeable that, while Wall Street utters these forebodings, interior cities, where tbe country's trade itself converges, stoutly dispute the vatication. Tbeir frequent attitude is that of protest against making serious deductions of any sort from the course of Stock Exchange speculation. A ring of gamblers, exceedingly powerful and exceedingly reckless, so they reply, had managed by manipulating dividends, borrowing heavily in Europe, and buying up stocks with such borrowings, to create an utterly artificial range of prices. In the end, readjustment had to come. A situation in which, for nearly six montbs, merchants and manufacturers had been paying 6 per cent. or higher for their loans, while dividend-paying railway shares were selling at prices which yielded investors, at that level, only 2½ to 4 per cent., could be corrected in no otber way. Stock market speculation, so this argument proceeds, had been absorbing throughout the winter capital urgently needed in general trade; now the inflated wind-bag has been punctured, and such capital as had actually been withdrawn by it was released for the more legitimate purposes. How could such an outcome be interpreted as portending a trade reaction?

This retort from the interior cities was reasonable; not less so when Wall Street had witnessed, less than a year ago, a sweeping decline in Stock Exchange values on the news of the San Francisco disaster—a demonstration whicb found no response in the movement of general trade. Yet the fact remains that the great body of experienced business men take serious account of a wide upward or downward sweep of Stock Exchange prices. The merchant who turns first to the stock market page of his afternoon newspaper, does not always or usually do so because he is speculating in the market. He knows that, speaking broadly, advancing prices point toward favorable developments in trade, and *vice versa*; and he conducts his own affairs accordingly. If he recalls bis own experience, he will remember that such a panicky decline on the Stock Exchange as occurred in 1893 was ended before the movement of trade and industry bad been clearly defined, but that what it may now be seen to have foretold was the twelvemonth of stagnant industry in 1894. Similarly, the prolonged rise in stocks in the autumn of 1897, and the advance of prices in 1898, despite the Spanish war, were forerunners of the real trade recov-

ery of the next three years. The Stock Exchange speculation of April, 1901, was wildly exaggerated by the misuse of credit and the diversion of trust funds into speculation; nevertheless, it was no inaccurate forecast of the exceedingly prosperous trade years, 1901 and 1902. The prolonged and violent decline in stocks during 1903 had been three months under way before trade returns gave any sign of industrial reaction; the Stock Exchange was demoralized in March; yet in May the country's "industrial barometer," its output of iron, had increased to the maximum monthly figure of our history. Not until October, when the decline in stocks was practically over, did the iron trade show distinct signs of reaction, and the halt in general trade occur. In all these instances, the Stock Exchange's prophecy was correct.

Why should the stock market possess this power of forecasting events in other markets, thereby becoming, as Macaulay described it nearly half a century ago, "the pulse which has for five generations continued to indicate the variations of the body politic"? The common and most obvious answer is, that the buying or selling orders, under which such a market moves, come from wealthy investors, whose experience or private information qualifies them to see further ahead than the ordinary man. This, in a general way, answers the question; but it does not go quite to the root of the matter. Naturally, such investors buy or sell, because they know that "good times" will increase the earnings and dividends of railways or manufacturing concerns, and "bad times" are likely to cut such earnings down. What is more, the capitalist, experienced in the ways of the money market, can often, in the light of today's phenomena, read that market's future months ahead.

Current events in the bank situation, in the course of foreign exchange, in the state of outside money markets—even in the domain of politics, where a new line of policy might involve large demands on capital for public uses, or large release of money to the markets—will at times point unerringly to abundance or scarcity of investment capital some months later. If abundant supplies are thus to be expected, sagacious capitalists will buy stocks, reckoning that, later on in the season, investors generally will be using their surplus funds on the Stock Exchange. If, on the other hand, signs of the times indicate coming scarcity of capital and exorbitant money rates, the far-sighted operator will be likely to part with his holdings, on the theory that, before long, the investing and speculating community will be selling to pay off its debts or use its capital in other directions. Be it noted also that these very conditions of the money market underlie very largely expansion or reaction in general industry. Great plethora of capital, easy rates for money, usually mean that business plans will be energetically pursued; that demand for manufactured goods and building material will be large, and that profits in all lines of industry will be enhanced accordingly. Actual scarcity of capital is likely to mean precisely the reverse, and each possibility is kept in mind on the Stock Exchange.

There is this much of truth, however, in the objection, cited above, to inference from Stock Exchange movements as to the future of trade prosperity: in a highly speculative period, the Stock Exchange overdoes things. There are always reckless spirits in the market—sometimes, as in 1901 and 1906, powerful capitalists with a previous record for conservatism—who lose their own heads at the sight of a violent rise or fall in prices, and speculate for their own account, as if the existing movement was to have no end. When this occurs, a wholly unreasonable range of Stock Exchange prices is created, which must find its own readjustment, quite irrespective of conditions elsewhere. Because values on such a stock market have advanced or declined, say, 20 per cent., within a month or two, it does not follow that trade and industry will forthwith expand or contract in the same proportion. People who would read the industrial future, at such times, will be wise in studying, not so much the Stock Exchange fluctuations as the actual money market situation which exists behind them.

NEW YORK, THURSDAY, MARCH 14, 1907.

The Week.

The prompt surrender of the California Legislature, in respect to its programme of anti-Japanese legislation, is fresh testimony to President Roosevelt's influence. But it brings out likewise the extraordinary lack of perception of the larger situation among the Californians. Difficult and delicate negotiations were in progress between our Government and the representatives of a high-spirited, successful, and sensitive nation. One of the necessary conditions for an amicable solution of the pending questions was a settlement of the San Francisco school controversy in a spirit of fairness, mutual friendliness, and respect. Yet the California Legislature was seizing this moment to plan new humiliations and restrictions for the State's Japanese residents. It does not appear that, until the President's rather peremptory telegram, the California statesmen felt any particular impropriety in what they were doing. It is to their credit that they saw the point so quickly.

"The Japanese-American War of 1907" is the title of a pamphlet just published in Germany. The anonymous writer is clearly more up to date than most of his kind. Similar works of the imagination, such as "The Battle of Dorking," have usually looked some years forward; but here is a soothsayer writing in Dresden on the 13th of February, 1907, describing what is to take place in the course of the coming twelvemonth. He is, we confess, a little vague as to the details of his *Krieg*. Japan, of course, seizes the Philippines instanter, and then the United States is driven to seek a peace, and give up the Philippines to secure it "bevor noch ein Japanisches Armeecorps in Amerika gelandet ist." This would not make it much of a war, after all. This German prophet will leave genuine militarists longing for more slaughter than he concedes them. As a matter of fact, he is really thinking more of trade and diplomacy than of war, more of Germany and England than of Japan and the United States. His brochure is really an argument for an Anglo-German alliance, and he conjures up his war, in which Japan is to conquer and thereafter become a formidable competitor of both English and German exporters, simply in order to help out his case. Hence he can hardly expect the world to classify his war of 1907 as either true or important.

George W. Perkins has walked up like a man and settled. Without waiting for the courts to compel him, he has acted promptly on the broad hint of the Court of Appeals, and reimbursed the New York Life Insurance Company, with interest, for the money he took from it in 1904 to give to the Roosevelt campaign fund. The question now is, Who will reimburse Mr. Perkins? Is the rich Republican party going to leave him in the lurch? Will not its President, filled with horror as he is at corporation abuses, see to it that the proper remedy is applied to this gross abuse, of which he was the beneficiary? Not only the New York Life, but the Mutual, the Equitable, and the Prudential, used policyholders' funds to promote the election of Mr. Roosevelt. This was an unlawful diversion of money. Its repayment can be exacted from the responsible officials. But that does not touch the duty of the Republican National Committee. The least it can do is to pay back the $54,000 to Mr. Perkins.

James Gayley, the first vice-president of the United States Steel Corporation, has done the country a service by explaining that unless the Government uses more armor plate, his armor-plate mills will have to shut down and throw thousands of skilled mechanics out of business. According to Mr. Gayley, his company must get contracts for 15,000 tons of armor annually to keep these mills going, and the reason for his present distress is that this year the Midvale Steel Company has underbid the Trust and got a large share of the work. Now, this complaint illustrates clearly where a large part of the demand for a great navy comes from. We are aware, of course, that from President Roosevelt down, many of the advocates of a navy honestly believe that this country will be ruined or kidnapped if we do not arm to the teeth. But their shrill outcries are heartily seconded by people like Mr. Gayley, who make thousands of dollars out of the big-navy mania—shipbuilders, gun-makers, armor manufacturers, etc. They know well how to dwell upon our "defenceless condition"; how to point to the necessity of safeguarding our insular possessions. Next winter navy officers will be warmly seconding Mr. Gayley's plea for more battleships, on the ground that we must have armor-plate factories in case of war. And the Steel Trust, with its scant one hundred millions of surplus, will be beside them, hat in hand, begging Congress for alms.

From the full programme of the National Arbitration and Peace Congress, to be held in this city April 14, it is clear that the gathering should be as influential as notable. Weighty subjects are to be discussed by weighty men. The aim of the whole is, plainly, to bring out the powerful peace sentiment in this country, and to demonstrate to our delegates to the Hague Conference how strong a backing they have at home. It was officially stated recently in Berlin that no proposals for limiting armaments figure in the *agenda* at The Hague. That may be true, formally, yet the question is bound to come up. If by nothing else, attention will be forced to it by the plans of the British Admiralty to make their naval programme depend upon the decisions of the Conference. The push that way of workingmen's organizations will also be felt. In Wisconsin, the Legislature has refused to grant an appropriation to represent the State at Jamestown, on the ground that the intent is to make the Exposition an occasion for glorifying militarism; and the labor members were the most vigorous in denouncing that plan, and in calling for a measure of disarmament. Whatever the defects of labor unions, we cannot deny them praise for their stand in favor of international peace, and in behalf of the classes most crushed down by huge military budgets.

Mrs. Sage's first large gift takes the form to which Mr. Rockefeller and Mr. Carnegie have accustomed us. The chartered board, with broad powers and a large endowment for the purpose of carrying on a specific work, has obviously come to stay, for it is probably the best way of conducting a great trust. Like the General Education Board, which makes education the country over its field, the Sage Foundation takes for itself the whole question of social and living conditions in this country, "by means of research, publication, education, and the establishment of charitable and beneficial agencies and institutions." The power to aid existing agencies is also desired. If there are those who find this programme rather vague and indefinite, we would remind them that this makes for elasticity and also for effectiveness. It will probably take at least two or three years for the trustees of the Sage Foundation to survey their field, organize their offices, and map out their first undertakings; and even then the precise line to be followed may not be fully revealed. Some new public need, some new evil, may appear a decade from now to which the Foundation may feel itself impelled to give most of its means and strength.

While such large endowments are now becoming so frequent that one wonders at the excitement over the Peabody Fund, the public cannot fail to give Mrs. Sage full credit for her generosity and wisdom.

If the press dispatches are accurate, there is one Virginia judge who is a disgrace to the bench. He is Judge Harrison of the Culpeper court, who has been presiding over the trial of the Strother brothers, charged with the murder of their brother-in-law, Bywaters. The latter's crimes are indefensible, but the brothers shot him in cold blood merely because he tried to desert their sister. A conscienceless jury having acquitted the guilty men on the ground of the "unwritten law," the judge is reported to have addressed them thus:

> Gentlemen of the jury, I thank you for a verdict which, I think, will be approved by the public. It is an established precedent in the State of Virginia that no man tried for defending the sanctity of his home should be found guilty.

Judge Harrison, though sworn to uphold the statutes, talks like a lyncher at heart. The Manassas *Journal*, published in a nearby town, recently printed an admirable editorial denouncing the so-called "unwritten law" as out of place in a civilized community. It says:

> If the unwritten law, established by the calm, deliberate judgment of our best men and enforced after due investigation, is insufficient to meet grave offences against the most sacred rights of home and person, then the duty of society is to establish such laws and such penalties as will meet all offences. Vengeance has no justification. The commission of one crime cannot wipe out another.

What makes the scandal worse is that Judge Harrison, at the outset of the trial, declared that the unwritten law could be offered only in mitigation of the offence, and not in justification.

Nothing could be more fatuous than the movement to secure by penal legislation an increase of "respect" for the uniform of the petty officers and enlisted men of the navy. It may be true, occasionally, that the proprietors of a public resort discriminate against Jack on shore in his uniform. His own regard for his uniform, however, has not been strong enough to prevent his slipping out of it and deserting the service in disgracefully large numbers. In general, it cannot be said that the American people deny to any particular body of men the degree of respect to which its character might fairly entitle it. The enlisted man of the navy can hardly have anything to gain, in the long run, by the cultivation of the idea that his regulation clothing calls for special consideration apart from conduct. The navy will gain more in popularity from stringent discipline under gentlemanly and efficient officers than it can ever hope to gain from the fine or imprisonment of some one who happens to deny a sailor admission to a dance hall.

If it be true that Mrs. Eddy has been "syndicated," and that her personal share in the dissemination of science and health is little greater than the present activity of Mrs. Lydia Pinkham in a somewhat humbler field of therapeutics, it does not follow that the members of the syndicate which runs the affairs of the Christian Science Church should be altogether displeased with the free advertisement they are getting through the lawsuits against them. So far, Christian Science has had no baptism of blood, though many unkind things have been said about it; and it would by no means militate against the growth of the Church should its aged leader be haled into court, as other protagonists of religion have been brought before Cæsar or his servants. To prove that the men about Mrs. Eddy have not slighted the financial side of the Church's affairs may repel large numbers who are opposed to Christian Science anyhow, but will prove no deterrent to the type of mind which now finds spirituality and business quite compatible. We may confidently look forward to a vast outpouring of sympathy for the persecuted Mother of Christian Science.

The race of false prophets is in no danger of dying out, and though John Alexander Dowie expired on Saturday, some one else in a few years will doubtless receive the attention he enjoyed. Most of the "religious" megalomaniacs who have essayed the rôle of oracle, healer, lawgiver, and prophet have sought to carry their followers back to a primitive age of faith. Familiar as most of them have been with the Bible and little else, they have, consciously or unconsciously, modelled themselves after the prophets of the Old Testament. Dowie declared himself to be Elijah reincarnated, yet he brought his astounding claim into the active life of Chicago without a sense of incongruity. More than that, when he led his followers away from the temptations of the world, he made for them not a hermitage or an Arcadian retreat, but a bustling, up-to-date industrial city. He inveighed against certain features of modern life, to be sure: for example, newspapers, patent medicines, and oysters. Otherwise, he belonged as truly to his own time as Confucius did to his. When he preached, a stenographer reported him verbatim, even to the pauses in which he parenthetically healed sufferers among the congregation. Sir William Muir traced the decline and corruption of Mohammedanism to the moment when the Prophet departed from the straight path of spiritual teaching and began to plan material rewards for true believers. In the same way, luxury and wealth are now everywhere given as the causes of Dowie's undoing. Yet the mingling of spiritual with material benefit has not always brought failure to new sects. As regards this country, almost the reverse might be stated. Mormonism, of course, presents the most obvious instance. The Mormon Church not only built up great industries in what had been a desert, but succeeded in handing them down along with the spiritual leadership to presidency after presidency. In the various communistic settlements attempted in this country, moreover, it may be broadly stated that the only successes have been those which intermixed business and religion. The purely secular associations ended by becoming plain business corporations, when they were perpetuated at all, while those which were merely segregated religious sects, were practically starved out of existence. The Amana Society in Iowa, which has been called the most successful communistic enterprise in the world, though conducted on a much more modest scale than Dowie's enterprises, has religion at the basis of its industrial life.

President Eliot is nearly guilty of *lèse-majesté* in his annual attack upon the evils of football at Harvard. Within three weeks of Mr. Roosevelt's heated denunciation of the mollycoddles who would end football because of its roughness, the president of Harvard insists that football, together with hockey and basketball, "remains an undesirable game for gentlemen to play or for multitudes of spectators to watch." We note, however, that President Eliot's view that "gross exaggeration of competitive sports is now working incalculable harm in schools, colleges, and universities," has already spread widely. Walter R Marsh, head master of the Pingry School at Elizabeth, N. J., and newly elected president of the Schoolmasters' Association of New York and vicinity, declared in his inaugural address:

> It is doubtful if we should ever hear of "ringers," professionals, inefficient umpires, and referees, ever feel the electric excitement that pervades the school the day before an important game—one of my acquaintances, a head-master of a well-known school, said openly that a defeat at the hands of an opposing school was a blessing to scholarship in his own school—it is doubtful if we should ever be troubled with all these things if we sharply, and still more sharply, restricted inter-school contests. Do not mistake me; I am not advocating the wiping out of all inter-school contests, but I am trying to advocate the very great restriction of the numbers of

such inter-school contests to the end that we may begin to train physically the weak, rather than the proficient athlete; and, most important of all, that we may lift the plane of scholarship in secondary schools.

There were others among Mr. Marsh's audience whose views of fierce competitive contests would not meet with President Roosevelt's approval. Dr. Charles D. Lorimer of Brooklyn actually wanted to return to those degenerate days when boys used to play games without coaching or getting their pictures into the newspapers! Now, he insisted, "they play, not for the sake of the play, but for the sake of a cheap trophy, or large gate receipts." If these evils have, as we believe, reached such a pitch, the time has come for parents and teachers to unite in stopping them.

Our Esperanto enthusiasts apparently have not stopped to think what must occur to their faultlessly regular structure if it should ever have breathed into it the breath of genuine linguistic life. If once it gets out of the "hall bedrooms and back parlors," in which the Editor of the *North American Review* has seen groups of devotees "studying it and teaching it with a zeal reminiscent of that of the early Christians in their cause," the natural laws of linguistic development will surely take hold of it, and gradually make it all over in their usual way. Few bear in mind that the greatest irregularities in language occur right along the path of most constant usage. A perfectly regular language is humanly possible only as a kind of Patent Office model, displayed to visitors behind a stout railing or under glass.

The first issue of a magazine for the blind has appeared in an edition of more than 7,000 copies. This, we venture to assert, is greater than the circulation of most scientific, philosophical, or theological journals. The contents of the first number would indicate that no wide gulf separates the mental interests of the blind from our own. There are short stories, a serial, a department of poetry, one of humor, a North Pole article, accounts of the San Francisco and Jamaica eartbquakes and of the German elections, and an article on the American flag. And yet the doubt arises whether a magazine that would be so absolutely normal to the normal man is quite adapted to the denizens of a world so different from ours. Before Kipling wrote "They" many persons have wondered whether the blind have not some special province of thought of their own, have not developed a "view" of life that we cannot glimpse, a psychic appetite that we do not possess.

The latest reports concerning the Russian Duma and its probable duration are highly optimistic. The day before yesterday they were highly pessimistic, and the day after to-morrow they may be that again. Altogether, there has been an abundance of wild talk about speedy dissolutions, dictatorships, and so on. This may possibly reflect momentary public opinion in Russia, but shows little careful consideration of the real forces at work. The autocracy may be, morally, all that its opponents declare it to be; but even if it stands only for organized enslavement and butchery, it must have a theory and some more or less definite line of tactics. Vacillating as the monarch may be, a man of resolution, such as Prime Minister Stolypin has shown he is, would not look forward to anything but a thorough attempt at some *modus vivendi* with the people's representatives. The Government is wise enough to see that to summon a Duma and then recklessly dissolve it can do only infinite harm. Public opinion abroad would be totally alienated, and at home even Octobrists, Moderates, Progressives, and Polish Nationalists would be swept into the Opposition. If, as the revolutionaries argue, the Duma has been assembled to pave the way for a foreign loan, that in itself should evidently prevent a speedy dissolution. The chances are that, for all the Government's tampering with the electoral law, it had little hope of getting a conservative Parliament. When the first Duma was dissolved the Government knew it would have to contend with an equally powerful Opposition in its successor. But it was fighting for time. And in spite of almost a year of repression by court-martial, a Duma with some inclination to do business seems to have been obtained. Why should it now be dissolved?

Poland's final attitude towards the great problems which now await solution in Russia will be determined by the response which her national aspirations shall elicit in the course of the next few months, either from the Government or the Duma. The Polish Deputies in that body at present belong to the moderate Polish parties: the National Democrats, the Progressives, and the "Realists," who have been long advocates of reconciliation with the Russian crown. Their programme calls for autonomy, which, as their leaders have pointed out, the autocracy offered them before the meeting of the first Duma, when their support was deemed necessary by the Government. Though the Duma disappointed these hopes, the Polish Deputies remained loyal to the crown, and refused to participate in the improvised assembly at Viborg. Their only reward, however, was a tightening of the administrative yoke, while in the Russian press a campaign was started in favor of strong measures to suppress a coming Polish insurrection. "The Russian Government," says a spokesman of the Polish moderate parties, in a letter to the London *Times*, "confused the legitimate aspirations of Poland with the reign of terror for which the helplessness of the Russian police was responsible, between the Nationalists and the anarchists." In vain Sienkiewicz, with 40,000 other leading citizens, made public profession of their desire to live in peace with Russia and their hostility to the idea of revolution or to violent tactics. The conclusion drawn by the correspondent of the *Times* is that revolution will come unless the Russian Government hastens to recognize the demands of the nationalist parties.

New Zealand, the land of industrial peace, the "Country without Strikes," has been passing through a period of strikes which demonstrate the utility of a Compulsory Arbitration act when people are willing to be compelled to arbitrate. Times are prosperous and wages are high in that country, but there have been strikes of street-railway employees, of domestic servants, and of slaughter-house workers. The last has been the cause of great loss, owing to the congestion of stock in the sheep-pens and its consequent deterioration. To evade the penalties of the Arbitration Act, the strikers at Wellington asserted that they had abandoned their unions and were acting as individuals. The Arbitration Court refused to recognize this plea, and imposed a fine on the first men to cease work, but without putting a check to the strike movement, which became general. Strangely enough, the present strikes are described "as symptomatic of a deep-seated discontent among the unionists, many of whom are now advocating profit-sharing in preference to the fixing of wages by the Arbitration Court." Unionism, however, can point to a splendid victory gained by the Wellington domestic servants, who recently formed a union under the Arbitration Act, and immediately struck. They won their case, and "1,000 mistresses are now likely to be haled before the Arbitration Court." The servants' demands included "preference for unionists, 1s. an hour for all work on holidays, work on Mondays, Tuesdays, Fridays, and Saturdays to cease at 7:30 P. M., on Thursdays and Sundays at 2 P. M., and on Wednesdays at 10 P. M.; all domestics to be home by 10 P. M., except on Thursday, when they may stay out till midnight." This is like the fat man on the Rhine, who, asked when he was accustomed to dine, replied, "At eleven, three, four, five, and seven, six, eight, and a quarter to nine."

TROUBLES OF THE RAILWAYS.

The flutter of the railway presidents, all over the country, is not without its amusing aspects. To see timidity, uncertainty, and gloomy apprehension displayed by men who, but a few months since, were audacious, cock-sure, and radiantly optimistic, cannot fail to excite the special wonder of the bystander. It certainly will strike him as comic that these worried magnates should now flee to President Roosevelt as their protector. They have pictured him as their scourge. The President, on his part, has repeatedly asserted that the States are powerless to bring the railroads to terms, and that nothing but Federal power is adequate to the business; yet now he is to receive the railroad presidents running to him in alarm as a refuge from the assaults of those impotent States! And Congressman W. W. Cocks, who has sometimes been Mr. Roosevelt's spokesman, is reported in Albany as saying, in the name of the President, that the Hughes plan of railway regulation is far too sweeping. But it is, undoubtedly, the widespread action of the despised States, culminating in the Public Service Commission bill of Gov. Hughes, that is disturbing the visions of railway managers more than all the fulminations from Washington. In no less than twenty-eight States have the Legislatures this winter had under consideration, or passed, bills which the railroads regard as crippling. The two-cent-fare movement, in particular, has gone from State to State in the West.

Yet if we look closely at the matter, what have the railroads to fear? If they have been guilty of financial folly themselves, they cannot escape its consequences; but the question now is of attacks upon their property by State Legislatures. But if any of these are arbitrary, unreasonable, or confiscatory, the law and the courts offer a complete remedy. Property cannot be taken or its true value impaired by statute. If the two-cent-fare law in Nebraska, for example, would compel the railroads to operate at a loss, it is certain that the Nebraska courts, on due proof being made, would declare it unconstitutional. It is stated that a suit will promptly be brought for that purpose. There exists, undeniably, a feeling of hostility against railroads, in many States, but no State can pass an act, and have it upheld by the courts, to destroy their lawful property.

The present outcry, however, is mainly about financial troubles. We are told that the roads are anxious to know where the funds are to come from for necessary improvements and extensions. Railroad bonds can scarcely be sold. Borrowing on notes, for three or five years, at high rates of interest, has been the forced resort of some railroads. They speak dolefully of their heavily increased expenses for higher wages and more costly *matériel*, and ask how much longer they can be expected to stagger on under these burdens, with meddling legislation added.

Now, as regards the heightened cost of operation, that is something which railway directors should have foreseen, and made provision for in their plans. All other business men have felt the same pressure of increased cost of production, and made up their budgets accordingly. But what was the course of the railroads? Almost without exception, they increased their dividends. Though the margin of earnings over charges was certain to shrink, and though we were plainly on the verge of money stringency, the larger dividends were paid out without a thought of the future. Some of the very roads that are now driven to loans, disbursed in dividends what ordinary foresight would have led them to keep for impending expenses. And no longer ago than last August, when the Union Pacific dividend was marked up to 10 per cent., the statement was given out at Mr. Harriman's office that "the maintenance of these rates seems easily within the capacity of the properties." Yet now comes the plea that the railroads have to pay 8 per cent. for needed money!

A number of roads have complained of their inability at present to float bonds or sell stock. Among them are Union Pacific, Southern Pacific, Atchison, Topeka and Santa Fé, New York Central, Baltimore and Ohio, the Pennsylvania, and the Norfolk and Western. Yet all of these railroads, within a few months, increased their dividends. They did so on the ground of abounding prosperity. Prosperity was unquestioned, but how about prudence? Should not the coming need of money have been foreseen, and have prevented the funds from being dissipated in dividends? An example of the wisdom of the contrary course lies at hand. Four railroads have lately been able to dispose of bonds and stock. They are the Great Northern, the Northern Pacific, the St. Paul, and the New York, New Haven and Hartford. It happens that none of them increased dividends. If this be merely a coincidence, it is at least a striking one.

The main question comes back to this: Does the panic of the presidents relate purely to the railroads as transportation companies, or as the basis of financial speculation? Is their thought chiefly of common carriers as affected with a public interest, or as affected with a stock-market interest? If they can make their attitude perfectly clear, and convince the public that it is sound, they have nothing to dread from hostile legislation, in the State Legislatures or by Congress. But as long as ambiguity remains—as long as we have railroad presidents who vote themselves 30 per cent. dividends and decline to say whether they were gambling in their own stocks, on the strength of information improperly kept from the public—so long will their cries of grief and fear and wounded pride be merely what the French economist called *travail superflu*.

WOULD-BE HARRIMANS.

We have had our say about the Harriman indecencies of finance, and would not recall a single word; yet we cannot refrain from protesting against some of the criticisms directed at him. He has been singled out for opprobrium as if he were unique and solitary in his offensive methods. To judge by some of his censors, no other railway man is tarred by the same brush; no other speculator in Wall Street ever manipulated securities and rigged the market after his greedy and shameless fashion; such a selfish lust as his for money, however acquired, exists in no other bosom. Now, all this is not simply open, in some cases, to the charge of hypocrisy, but, in all, to that of stupidity. We must see clear in these matters. It is no plea for Harriman to say that he is but the flowering of a system by which the whole social and mercantile world is affected; or that any man of open mind and sensitive heart, who knows what demoralizing forces are throbbing about him and pressing upon him in this age, will candidly say, even while pointing the finger of condemnation at Harriman, "But for the grace of God, there goes myself."

Indeed, the exposure of individual transgression always loses half its warning effect unless it drives us back to the larger causes. Such a man as Harriman would be not only abhorrent but impossible in a society where simplicity and the right perspective of life and high ideals and pure morals and sensitive honor held sway. He is but a product; and the conditions out of which he grew are under the eyes of all and felt of all. It is because our general standards of business probity have been lowered; because we all know what is the stress of the temptation to make haste to be rich; because the merely 'awful has, with us all, a way of taking the place of the honorable; because the pressure of our time is away from nice consideration for others and towards blind struggle for one's self and exaltation of great pecuniary gains, compassed by fair means or foul—because, in a word, the sin of society is mirrored in the separate man—that the disclosures concerning him are so instructive and so salutary for the rest of us. If we are honest, we must look well to it that we do not condemn in another what, in substance, we allow in ourselves.

Among the loudest railers at Harriman have been organs and representa-

tives of labor unions. But who can study the spirit in which they are conducted, or scrutinize the animus of too many of their leaders, without seeing that they exemplify precisely those characteristics of Harriman which have disgusted all observers? Where will you find more hoggishness, more low and unscrupulous cunning, than in some of the men who pretend to speak for the working classes? It is not conscience, but only the lack of opportunity, that prevents them from doing the very things for which they clamor at Harriman. On a small scale, and up to the limits of their ability, they already do those things. Self-voted dividends are no worse than the personal graft of walking delegates. They display a greed, a brutality, a d'sregard of the rights of others, a cynical belief in the law of the stronger, as plain as ever marked the operations of a railway juggler or a gambler on the Exchange. They would be Harrimans if they could.

If no stones were to be cast at Harriman except by those free from all his faults, he would be in no danger of suffering the martyrdom of St. Stephen. Everybody would be estopped who wants to get ahead by trampling on his fellows; everybody who is planning to get money by indirection or manipulation or out of other people's pockets or, by trick or favor, out of the United States Treasury. The schemers for protective duties are no better than the grabbers of railway franchises. California is virtuously aghast at Harriman's iniquities; but let an appraiser in New York rule that some raw olives may come in tax free, and the howl of rage and greed from California can be heard across the continent. To get something for nothing, big money for no work, is of the essence of the condemned Harriman transactions. Yet what is the real difference between them and the process of getting a subsidy voted out of the public funds? For the latter, however, President Roosevelt, the great moral exposer and denouncer of Harriman, sends in a special plea to Congress!

It was a devout soul, F. D. Maurice, we believe, who said that he unfeignedly repented of the sins of his fellowmen. It is a difficult thing, but it is desirable, to bring home to a whole society the sins of one of its typical members. Tolstoy has told of the failure of such an effort of his own. He one day assembled some villagers to read to them from his "Powers of Darkness." The man in that piece, after a long course of debauchery and robbery and even murder, all undetected, falls on his knees in the presence of the people and cries out, "I am guilty." But the *mujiks*, whom Tolstoy hoped to impress, simply said: "What a fool he was to confess!" Similarly, it may be feared, many would-be Harrimans, if they spoke the thoughts of their hearts, would say: "What a fool he would have been if he had not taken everything within his reach."

"DOING SOMETHING" FOR OUR SHIPPING.

Senator Gallinger wound up his confession of defeat for ship subsidies, last week, by predicting that there would yet be "an uprising of the people of this country" to "do something for the American merchant marine." He meant, we suppose, another fight for subsidies. But it is clear that, for at least two years to come, there is absolutely no hope of success along that line. This year was the Gettysburg of that war. With a Republican majority of 112 in the House, it was barely possible, by exerting all the strength of the organization, to get through an attenuated and comparatively harmless bill for a postal subvention to two or three South American lines. As it was, fifty Republicans voted against it. In the next Congress, with the Republican majority cut in half, the chances of an outright subsidy bill would be nil. Certainly, during its first session, with a Presidential election and the choice of a new Congress impending, nothing whatever could be done. Is it not time, then, that the shipbuilders and marine interests and "the friends" of the flag afloat should stop pinning all their hopes to this doomed project, and should inquire what else they can do to restore American shipping on the high seas?

We share to the full the mortification of those who recall the fact that our merchant marine once led the world, but has now sunk so low that 91 per cent. of all our foreign commerce is carried in foreign bottoms. This is not as it should be. All of us would like to see powerful and well managed and profitable merchant fleets, under the American flag, sailing to all the great ports of the world. The trouble cannot lie in the decay of our hardihood and spirit of adventure and talent for seafaring. Something abnormal or artificial has intervened to paralyze this form of American activity and success. If our invention, our enterprise, our daring on the sea were to be given free scope as in the years 1830-60, and if our capitalists could be given motive for investing in ventures over the sea and on the sea, we could surely hold our own in the building and sailing of steamships. What is the real trouble and what the most hopeful remedy?

Secretary Root stated the truth with commendable frankness, in his Kansas City speech. He squarely admitted that the protective system had laid a destructive hand upon American shipbuilding. By a system of duties on materials, buttressed by antiquated navigation laws which absolutely forbid foreign competition, it had mulcted every American who set out to build a ship. Moreover, in the sailing of such a ship, the protective tariff stepped in to make the expense greater by creating an artificially high rate of wages. Mr. Root's argument was that, inasmuch as the Government had thus by law hampered the shipping industry, it ought to make up for the penalty by giving a bounty. In other words, the crippling effects of protection ought to be compensated for by a subsidy. Saying nothing now of the merits of this argument, we merely submit that its conclusion is politically impossible of application. The American people are not thinking of granting new subsidies, so much as of repealing some now given under the guise of protection. Instead of "logically extending" the protective system so as to include bounties for shipping, the political drift is, rather, towards restricting and cutting down the protective duties now in force. The people are moving in directly the opposite way from what Secretary Root would have them. His plan being impossible, for a long time to come, at least, some other should be tried.

A bill was introduced in the House of Representatives by H. T. Rainey of Illinois to take off some of the burdens of American shipbuilders. It proposed to admit free of duty all materials used in the construction of vessels in the United States, and also to permit ships built partly of foreign materials to engage in our coasting trade, as well as to repeal the present barbarous statute which compels the owner of a vessel to pay a duty of 50 per cent. on all repairs made abroad. Congressman Rainey received and had printed letters from a number of ship-building firms heartily approving of the proposal. The Pacific Shipping Company of San Francisco, for example, wrote that the abolition of the duty on steel plates would be "an entering wedge in forcing the Steel Trust to lower its price." The exactions of our steel-makers were brought out forcibly in the hearings before the Senate committee, where it was shown that our patriotic manufacturers charge their fellow-countrymen 30 per cent. more for steel plates than the price conceded to foreigners. Here, then, is one way to "do something" for the American merchant marine. As we cannot help it by extending the tariff, we might well try the effect of removing the tariff.

One distinction we must get clearly into our minds. Do we want merely to build ships, or to own and sail them? Is it a bolstered shipbuilding industry that we desire, making a lot of work but turning out an unserviceable product, or is it the possession of fleets of vessels able to engage in foreign trade profitably? If the latter is the object—and it

is surely the only reasonable one—we might approach it by repealing our navigation laws and allowing American shipmasters to purchase vessels built in foreign yards, as do the German lines. This, at the same time, would put our domestic industry on its mettle; and there can be no doubt that if it got rid of its tariff handicap, and went on to standardize shipbuilding, like the concerns on the great lakes, competition need not be dreaded. In any case, it is time we gave up lying helplessly on our backs and crying to Washington to give us a ship subsidy. We shan't get it; and if we really desire an American merchant marine, the thing to do is to set American skill to work to build, or buy, and sail it.

UNSOCIABLE WEALTH.

It is a commonplace of socialistic teaching that to be socially minded is a virtue exemplified chiefly by the poorer classes; and there is a certain ground for this belief. Philanthropists know well enough how impossible it is to induce the poor of the city to exchange for comfort, with loneliness, in the country the friendly squalor of the slums. Wealth, on the other hand, is represented as essentially exclusive and incapable of easy comradeship. G. K. Chesterton has recently illustrated the antithesis with his accustomed ingenuity. Asmodeus-like, he takes the roof off a British railway train and observes the passengers in the first class and in the third. In the dearer compartment reigns a fairly Indian silence and suspiciousness; the travellers are frigid and self-conscious, doing the necessary civilities awkwardly, as if grudged. In the cheaper seats there is general talk and enjoyment. Such emergencies as the intrusion of a quarrelsome or drunken passenger are met with a relish. In fine, says Mr. Chesterton, the third-class people are really civilized, the first-class people display the solitary and timorous disposition of the savage.

Abstracting what is merely English from this apologue, there remains a considerable amount of general truth. In the name of privacy, wealth and culture have often cut themselves off from easy relations with their fellow-men at large. A very little study of history will show that such isolation has increased in comparatively recent times. If one were to reconstruct the life of a Florentine banker of the Renaissance and compare it with that of a New York banker, the difference would appear striking. About the palace of a Medici were huddled the shops and dwellings of the small folk. As he walked to the Signoria he saluted the bystanders, many of whom he knew by name. They likewise knew all his doings minutely. His palatial home was filled with servants who were not treated as menials, and, besides, there was a whole staff of retainers who were of the family in the sense that office clerks, and even social secretaries, rarely are to-day. His excursions were made on horseback; his pleasures were readily seen of men. In short, to be what we to-day call a "good mixer" was until quite recently a quality indispensable to every man in great place.

The advantages of this régime are obvious. It is difficult to hate a man who tips his bonnet to you several times a week; it is easy to loathe abstractly a magnate you have never seen except through the blur of his possessions, and who can never by any chance see you. One might hold that the invention of the coach was the beginning of invidious class distinctions; at any rate, it is their symbol. The carriage implies as much superiority as the gig of Carlyle, and more unpopularity, as it connotes great aloofness. The motor-car has added a menace to what was formerly an offence. The drawback of class isolation is, from the point of view of wealth itself, that the average man interprets the plutocratic unknown, not in terms of magnificence, but of baseness. We believe that any mysterious millionaire would lose much of his odiousness, and justly, if he could cease to be a myth and be known as the human biped he actually is. A country grocer who has flourished through the same arts is at least tolerated by his community; and if by any turning back of the clock, Mr. Rockefeller could be known on Grand Street as a Medici was on the Via della Vigna Nuova, the chances are that his ogreish glamour would promptly disappear.

Enough has been said to suggest the possible danger of unsociable wealth and the desirability of a better understanding between the rich and the poor. Clearly, this cannot come about through a revival of bygone conditions. Apparently, the administration of new-style charity must continue to be too impersonal to afford the necessary bond. The college settlements and kindred enterprises make praiseworthy endeavors along this line, but their scope is evidently limited. There is greater hope, perhaps, in the cultivation of a sort of family feeling in factories, railroads, and mines. All such enterprises afford to the rare employer truly patriarchal opportunities. But a decided change will hardly come about until wealth realizes the disadvantages of its increasing isolation. Then we may expect to see millionairedom follow prudentially and with some pain the path trodden at all times with ease by elect spirits, whether rich or poor. Probably the rich stand to gain most from such a venture, but the profit to the poor would not be small. Hatred and envy are about the ugliest passions that can possess the human breast, and to-day many an honest man may hate an entire class unreasonably, simply because he has never been in friendly relations with any of its individuals.

HOW BEST TO BEQUEATH.

How shall our modern philanthropists dispose of their gains—well or ill-gotten? The question has happily become a pressing one by reason of the extraordinary generosity of our well-to-do Americans, at which all the world marvels. The problem relates not merely to the kind of enterprise to which one shall give or bequeath, but to the actual method by which the gift is made and the formalities with which it is surrounded. Is it to be hedged around with all sorts of restrictions, or is the legacy to be left to the trustees of a benevolent society or an institution, with full confidence in their wisdom and integrity? And can any conditions be made which will stand the test of time, and not in the lapse of centuries become in themselves absurd or actually defeat the testator's very aim?

There is an old legend that John Harpendinck, the Dutch tanner who willed to the Reformed Protestant Dutch Church in 1724 the land upon which the present publication office of the *Nation* stands, coupled with his bequest the condition that for all time thereafter a Dutch sermon should be preached every Sunday in the church. After a while the courts are said to have freed the church from so unintelligible a ceremony. Apocryphal as this story is, it yet serves to illustrate how changing circumstances might make of a pious wish an idle and harassing form. But there is still another side of the matter. An inheritance for excellent purposes may in itself work great harm either by adding to the burdens of an already overweighted institution, or it may, on the other hand, pauperize or paralyze where it should be a stimulus and an incentive to even more vigorous growth. Writing in the *Atlantic Monthly*, William H. Allen, long connected with New York charities, declares that, while volumes have been published to warn workers of the dangers of pauperizing the needy, "not enough has been written to show the danger of pauperizing the charity worker, college president, hospital trustee, ladies' auxiliary, board of aldermen, or posterity." To pay out or leave money, he remarks, "for certain disappointment, to buy censure where one aimed to silence it, to carve a family name on a gold brick, is not efficient giving."

Some of the instances of unwise bequests cited by Mr. Allen admirably illustrate his point. A banker, who had heard much of a hospital's needs, left it $50,000 for a memorial wing, which bore, when finished, the inscription, "In

Memoriam, Mrs. Grateful Patient"—and added $50,000 to the hospital's fixed charges, for which it had not a single additional source of income. In the meanwhile several large donations were reduced because of Mrs. Grateful Patient's large bequest. A similar experience befell, we know, an institution which received a good deal from Mr. Carnegie. Many patrons of long standing refused to renew their gifts—for which the need was as great as ever. To return to Mrs. Grateful Patient's hospital, the net result of the bequest has been that the institution has never been able to make both ends meet. Legacy after legacy has been used for current expenses, and the city's money, formerly regarded as inimical to the best interests of a private hospital, has reluctantly been accepted. Far different is the story of the founding of the Phipps Institute for the Study and Prevention of Tuberculosis. This is Mr. Allen's account of it:

> Numerous suggestions were made, including the need of leadership in the popular crusade against consumption. Without disclosing his own identity, the possible giver communicated for over one year with a physician thought to be eminently qualified to organize such a crusade. A hundred units of inquiry were found—extent of the need, various methods of fighting tuberculosis, world-evidence of successful treatment, a detailed plan of procedure, with estimates as to expense of publication, laboratories, dispensaries, administration. Had a steel mill been involved instead of a health crusade, the procedure could not have been more businesslike.

As guides to will-makers, Mr. Allen makes ten suggestions, accompanied by such bits of wisdom as: "Do not give an elephant to a peasant, or an automobile to a push-cart merchant." "Unless," he says, "one cares—can give himself with his gift—leave it to the public treasury, where it will probably do less harm than if left to charity or to education." The next thing is, if one cares, to be sure that the gift will relieve and not increase a burden, and that it is accompanied by no inelastic conditions. But if temporary restrictions must be imposed, give to the least popular rather than the most popular aspect of the beneficiaries' work. To specify of a legacy that its income shall not be used for salaries or management may invite waste and inefficiency, while giving specifically for those purposes will often convert an inefficient society into an efficient one. Again, Mr. Allen makes the excellent recommendation that unrestricted legacies be accompanied by a request for an annual accounting for the principal through at least the first ten years. Finally, Mr. Allen remarks that endowed brains can readily be adapted to changing needs, but brick and mortar cannot.

President Eliot is also deeply concerned for makers of testaments, and in his latest report has considerable to say about the subject as viewed by the head of a university. Colleges more than other institutions have notoriously suffered from restricted gifts. The value of unrestricted gifts, or of gifts which leave large discretion to the President and Fellows, is, he says, "always mounting and becoming more generally recognized." For the trust imposed upon these officers is much more than to execute the wills of the benefactors; it is a trust "to keep the entire institution abreast of the progress of society, generation after generation, and to foresee and provide for the oncoming wants of the next generation." While keeping unimpaired the gifts of past benefactors, the university must also have "free money to devote to new objects and new methods of instruction not yet visible, perhaps, to any intending benefactor, but well known to the experts who are directing the operations of universities. It is the most far-seeing universities, and those most prompt to meet new needs, which will serve their communities best and deserve best of the Republic." Like Mr. Allen, President Eliot remarks upon a bequest of the late James C. Carter of this city as distinguished for far-sighted judgment in bequeathing. That great lawyer knew well how times, needs, and conditions change, and by his example proved that to bequeath wisely one must study the object, then give freely, and with just as little restriction as possible. Boards of trustees may prove foolish or recreant a century hence, yet faith is essential in making a will. No man can hope to look far beyond the grave.

THE NURSE IN FICTION.

The trained nurse has secured a distinguished place in the modern novel. Formerly it was the heroine who cared for the hero when he was suffering from the inevitable attack of brain fever—that peculiar disease invented by writers of romance. It was she, too, who attracted the young doctor's attention during her father's last illness, and who at length wiped the "death damp" from the parental brow. In some stories a semi-professional person, who was also a female villain, used to invade the sick room; but her office was to go behind the screen and drop poison into the medicine glass in which the patient's "potion" had been prepared. The poison was always bitter, although the female villain was rather sweet. But, like the automobile and the motor-boat, the trained nurse has come to stay.

There are two ways of portraying her character—one realistic, the other idealistic. The realistic nurse drawn from life, while of scientific and hygienic, is of no romantic interest whatever. Not so the idealistic nurse, who is far more dangerous to the health and life of the patient than was the old-time female villain behind the screen. She is almost as picturesque a figure as the sister of charity in the French novel, who tells her beads by the heroine's deathbed, while the hero walks about the room, tearing his hair and exclaiming, "Je pleure"! As a matter of course, the nurse is pretty, and her uniform becomes her well. Even if her cap is not "jaunty," it is "immaculate." She is kind, discreet, gentle with the servants, civil to the family, obedient to the doctor, and sympathetic with the parson. Her demeanor is calmly professional, and there is a mysterious glint in her sombre eyes.

But her chief fault, which the author usually reveals without intending to do so, is her utter neglect of aseptic precautions, and her ill-timed talkativeness when complete repose and silence are therapeutically indicated. In fiction, if typhus fever breaks out among the tenantry of the wicked baronet, the trained nurse rises to the occasion. In spite of the curate's warnings, and the sentimental doctor's remonstrances, she goes into "hovels," working day and night, until cruel shears deprive her of the "glory of her dark brown hair." Should she survive the dangers of the epidemic, she may be represented as hurrying from the stricken cottager's bedside to take charge of the new-born heir at the castle. For no fear of carrying contagion should interfere with her duties to the aristocracy. If the case upon which she is engaged be one of pneumonia—called by the novelist "lung-fever"—or typhoid, requiring very hard work and unceasing watchfulness, she must spend the lonely hours looking down the long avenue of elms, and listening to the rain pattering against the window panes and the wind sobbing about the gables. When the patient mutters in delirium, she hangs over him, eager to discover such secrets as he may reveal. But she does not take his temperature. When he tosses to and fro during the long hours of the night, she does not think of ice-packs or of sponge baths. But she "motions" anxious relatives from the room, and when the doctor looks grave and shakes his head—a gesture which physicians make only in novels—she "retires" to hide her emotions.

The time is coming when the trained nurse of the novel will take the place of the governess. Governesses have been done to death by the masters of fiction. All readers are familiar with the "institutrice irlandaise" of the French romances, upon whose shoulder the heroine weeps while the hero is behaving in such a manner that one is surprised that he should still be at large. There is the wicked governess who trifles with the affections of another's husband. There is the pretty governess who is startled when the hero comes upon her

in the school-room. There is also the humorous old-maid governess who is addressed by her surname without a prefix, and who knew the heroine's unhappy mother in happier days. But the trained nurse has greater dramatic possibilities than the prosaic directress of education. She is naturally on hand at the important crises of birth and death. She witnesses last wills and testaments, acts as confessor to the moribund, and consoles the survivors. When she rises from her low seat as the physician enters the room, we know that the latter is either to be unveiled as a charlatan, or to be accepted as a lover.

Writers who introduce nurses into their stories must be a most robust and healthy clan. If they had ever been ill, they would be aware that nursing is a laborious profession, and not an amusement nor a sentimental occupation. The nurse in "Romeo and Juliet" was not trained, but seems to be the type of her class as portrayed by authors since Shakespeare's day. So undisciplined was she that upon seeing Romeo dead she "swounded at the sight."

CARNEGIE PENSIONS AND SECTARIAN COLLEGES.

By the terms of Andrew Carnegie's letter of April 16, 1905, establishing a system of pensions for teachers in American universities, colleges, and technical schools, sectarian institutions were expressly excluded. Sectarian institutions were defined as "such as are under the control of a sect or require trustees (or a majority thereof), officers, faculty, or students to belong to any specified sect, or which impose any theological test." The Federal statute of March 10, 1906, incorporating the Carnegie Foundation for the Advancement of Teaching, repeats substantially the same statement, save that the modifying phrase, "or a majority thereof," is made to apply to officers, faculties, and students as well as to trustees. The trustees are further empowered, however, by the act, "to modify the conditions and regulations under which the work shall be carried on, so as to secure the application of the funds in the manner best adapted to the conditions of the time," and to "enlarge or vary the purposes herein set forth, provided that the objects of the corporation shall at all times be among the foregoing and kindred thereto."

The first annual report of the president of the Foundation, dated October 15, 1906, grouped under the following heads the institutions considered as denominational:

(1.) Institutions under absolute denominational control and ownership.

(2.) Institutions in which the governing body is appointed by and is directly responsible to a formal religious body.

(3.) Institutions whose governing board must be confirmed by and must report to a religious organization.

(4.) Institutions having no formal connection with a religious body, but which require, either through the provisions of their charters or by votes of their trustees, that a majority of their trustees, officers, or professors shall belong to a specified denomination.

(5.) Institutions which have no formal connection with a denomination, but a strong sympathetic one, and which are generally looked upon as denominational.

A list of fifty-two "accepted" institutions, two of them in Canada, accompanied the report, none being included whose classification would place it in either of the first four of the above groups. Retiring allowances were, however, conferred upon six professors in institutions not in the accepted list, and this number has since been added to.

The publication of this "accepted list," eagerly awaited by those whose welfare was immediately concerned, was received with surprise and disappointment in more than one college and university. Whether because the list was made public before the report was available, so that the reasons which had influenced the trustees were not known; or because the terms of Mr. Carnegie's gift had not been attentively examined, there was undeniably a disposition to feel that the trustees had adhered to the letter of the law at the expense of its spirit. It was to many a college teacher a rude shock to find Harvard, everywhere identified with Unitarianism; Yale, the chosen citadel of Congregationalism; Princeton, the home of Presbyterianism; Tufts, the special pride of Universalism; and Trinity, Episcopalian to the core, included in a list of unsectarian institutions; while others whose denominational affiliations were only nominal, or in whose management there had perhaps never been more than a faint shadow of denominational control, were labelled sectarian, and a door of great hope closed to their hard-working and ill-paid faculties. That "strong sympathetic connection" should not be a disqualification, while the slenderest thread of legal obligation should disqualify, seemed to many quite inexplicable.

That the Carnegie trustees have interpreted their powers as generously as the law will allow, must, I think, be conceded; indeed, the mere mention of the names of the board would preclude any contrary assumption. The position in which the excluded institutions are left, however, is a question of the utmost seriousness. For most practical purposes, the colleges and universities not on the accepted list have been, as it were, placarded before the public as inferior institutions, not because they do not do good work, but because they do not appear to enjoy complete intellectual freedom. That the inference thus loosely drawn by an undiscriminating public is false, and quite unwarranted by any action of the trustees, will not avail much. To the extent to which the impression gains currency, it must become increasingly difficult for institutions which, though not denominational in fact, are such under the Carnegie definition, to attract students, endowments, or teachers. For explain it as we may or regret it as many will, the day of sectarian control of higher education in this country is rapidly passing; and the existence of a great educational foundation from whose benefits every institution with never so slight a denominational connection is excluded, seems likely to make clear once for all a differentiation no longer to be ignored.

Practically, there would seem to be but two courses open to the excluded colleges and universities. They may remain as they are, or they may alter their charters and government so as to conform to the terms of the Carnegie gift. In my judgment, the greatest problem now confronting American colleges and universities is that of adequate compensation for instructors. Not buildings, or laboratories, or libraries, or museums, but the faculty, make the university; and the wretchedly low scale of remuneration which now obtains, often below any possibility of decent or happy living, cannot but result, as I believe it has already resulted, in a progressive lowering of the quality of the men and women who choose teaching for their profession. The Carnegie fund, far from being a charity or a dole, is of the nature of an addition to the endowment of every institution entitled to share in it; and there can be nothing unworthy, no mere "trying to get a pension," in seeking to adjust an institution to these new and beneficent conditions. Those institutions, accordingly, which prefer to remain as they are, must contemplate either the establishment of pension systems of their own, or an equivalent increase of salaries; and while neither task is impossible, both are difficult.

On the other hand, the fundamental alteration of charters may well present many difficulties. Aside from legislative troubles in States whose legislation goes by favor, or which will grant favors in one direction only in return for burdensome concessions in another, there are numerous practical obstacles to be overcome. Denominational ties are often hardest to break in proportion as they have become nominal. The older alumni, especially ministers, must be reckoned with, as must denominational journals; for there are still many persons who will make no distinction between the abandonment of sectarianism and the abandonment of religion. There are likely to be legal difficulties, too, in some cases, connected with the adjustment of gifts conditioned on sectarian uses, or which imply a pledge of continued denominational connection. As for boards of trustees, these are always reluctant to change the nature of their being, while the devising of a new scheme of government certainly raises perplexing questions everywhere. All these are real difficulties, not easily to be got over. But the institution which wishes to have the largest response to its appeal for funds, the ablest and most permanent faculty, the widest range of choice for president and governing boards, the most active and discriminating demand for the services of its graduates, and the firmest hold on the respect and affection of the community, must henceforth possess the form as well as the substance of intellectual freedom. If the Carnegie Foundation for the Advancement of Teaching shall make possible the fashioning of new bottles for the new wine of its beneficence, it will have performed a distinguished service.

WILLIAM MACDONALD.

Brown University, Providence, R. I.

NEWS FOR BIBLIOPHILES.

The most important auction sale thus far this season in New York will be the offering of the private library of Louis M. Dillman of Chicago, by the Anderson Auction Company, on March 21. The collection is primarily first editions of the

greater nineteenth century English authors, such as Coleridge, Lamb, Keats, Shelley, Browning, Tennyson, and Rossetti; but there are a few important earlier books, the most notable being the first edition of Milton's "Poems," 1645. This is in blue levant by Rivière, and is a tall copy (6⅛ by 3¾ inches), with a fine impression, with margin, of the rare first portrait of Milton at the age of twenty-one, engraved by Marshall. The last line of the imprint in this copy has "in Pauls Church-yard"; some copies, as that in the Lenox Library, have "in S. Pauls Church-yard." It seems more probable that the "S." was inserted during the printing than that it was taken out; and if so, the variety without it may be called the earlier issue.

The rarest book in the collection is Browning's "Pauline." This is the Maxwell-Morgan-Appleton copy, which has already been three times sold at auction, bringing $260 in 1895, $720 in 1902, and $1,025 in 1903. It was given by the father of the poet to the latter's uncle, Reuben Browning. Among the other Browning first editions are "Paracelsus," 1835, original boards, uncut; "Strafford," 1837, original paper cover, uncut; "Sordello," 1840, one copy in boards uncut, the earliest form of binding, as well as another in cloth; "Bells and Pomegranates," 1841-1846, a complete set of the eight parts, bound in one volume in cloth by the publisher at the conclusion of the series; "Cleon," 1855, "The Statue and the Bust," and "Gold Hair," 1864, the last three the rare privately issued leaflets.

The two authors in which Mr. Dillman was most interested were probably Coleridge and Lamb. The first edition of Coleridge's "Poems," 1796, is in original boards, uncut; of the second edition, 1797, there are two copies, both in original boards, uncut, but differing in color of cover papers. "Christabel, Kubla Khan, a Vision," etc., 1816, is in the original paper cover, uncut. The other and commoner books are also mostly in the original bindings. The Lamb collection includes some notable rarities. The "Tales from Shakespeare," 1807, two volumes, is in original boards, uncut, in this condition so rare that no sale at auction in America is recorded. Indeed, not more than four copies seem to be known in this country. Several other Lamb items, such as "John Woodvil," 1808; "The Adventures of Ulysses," 1808; "Elia," 1823, and "Last Essays of Elia," 1833, are uncut. "Poems on the Death of Priscilla Farmer," by Charles Lloyd, an immense folio pamphlet of twenty-seven pages in the original marbled paper covers, is exceedingly scarce, and brings a high price, chiefly because it contains, pages 25 to 27, a poem by Charles Lamb, "The Grandam." The Dillman copy, presented by Lloyd to his sister, Priscilla, contains an inscription in his autograph, as well as numerous autograph corrections.

The Rossetti series contains the first books of the brother and sister, "Sir Hugh the Heron," 1843, by Dante Gabriel, and "Verses," 1847, by Christina. Both were little pamphlets from the private press of their grandfather, G. Polidori. There are also the proof-sheets (242 pages) of Rossetti's poems which were privately printed in 1869. In these sheets are a number of poems not included in the published volume of 1870. The pagination is irregular and a few printer's corrections are indicated.

The Shelley collection includes several rarities, among them "St. Irvyne," 1811, uncut; and "Queen Mab," 1813, original boards, uncut. The three volumes of Keats's writings published during his lifetime are all desirable copies. The "Poems," 1817, is in original boards, uncut, and contains, moreover, on the title an inscription "To my Friends the Miss Reynoldses, J. K." The "Endymion," 1818, is the Rowfant copy. Four lines from the original manuscript of "Lamia," an interesting quatrain in Hood's autograph, with comment in verse by Tennyson, and an excerpt from the *Quarterly* containing the famous review, are inserted, as Locker in his note says, "with questionable taste." The book also contains the following interesting though ungrammatical note in Locker's autograph:

The leaf of errata after the preface is very often missing, in this copy it is not even cut open. I hope no Yankee, who will probably some day add this volume to his Library at Chicago, will have the grace not to open it.

The Tennyson collection includes a superb large paper copy of the "Poems by Two Brothers," 1827, original boards, uncut, as well as uncut copies of the author's three succeeding volumes: "Poems Chiefly Lyrical," 1830; "Poems," 1833; and "Poems," 1842, and later books. George Meredith's first book, "Poems," 1851, printed at the author's expense, is in the original cloth, uncut, a presentation copy with inscription. Ruskin's "Poems," 1850, is a fine copy in original cloth, the top edges, usually gilded, being untrimmed. Among other authors, whose works would, in a sale of less importance, deserve especial mention, are, Matthew Arnold, Byron, George Eliot, Leigh Hunt, and Stevenson. There is a collected set of Waverley Novels, all first editions, 74 volumes, in a uniform binding by Tout. A few American authors, notably Longfellow, Lowell, Poe, and Whittier, are represented by important books.

Correspondence.

POLITICS IN LIBRARY MANAGEMENT.

To the Editor of The Nation:

Sir: So much has been written on the ideal side of library work, and modern library schools and clubs have done so much to create in the minds of their graduates and the public an impression that the modern public library is invariably conducted with a nobility of purpose and an unselfishness of administration which amount almost to sacrifice, that it may be useful to examine the actual state of affairs in a number of our large libraries.

In such a survey we find that the most marked divergence from the ideal is in the power which political favoritism and corruption—and the many contributory evils which follow in their wake—exert in certain municipal libraries. This favoritism affects all the staff, from the librarian to the janitor; and their actions are ordered entirely by political expediency. How then can we expect that the ideal service to the public, as expounded by the professional journals and taught in the training schools, can be given?

The librarian is, first of all, a lobbyist for his library. Funds must be wrung from the city authorities every year; and to do this, with the aid of the working members of his board, takes up much time and energy which, under the ideal system, properly belong to the public. He must flatter and cajole; give special privileges and extra service; offer the resources of the library without the usual restrictions; fling rules to the winds; allow raids to be made on his new magazines and books—and in many other ways coax the support of the powers that be, all at the expense of the general public.

Nominally not "in politics," yet actually often subject to the wishes or orders of some ward leader or "boss" in the matter of appointments, how is the library to secure the best material for its personnel? How make promotions for merit among those already employed? A board of trustees is usually powerless, or too negligent of its duties, to prevent this outside interference. Unnecessary and cumbersome departments are created solely to provide places for "heads" and "chiefs" who owe their positions to "pull," and place fealty to their patrons before service to the public. Usually these self-important "chiefs" (sad to say they are often women) have so little real work to do that most of their time is taken up in planning and launching some fresh foolishness, of no actual value to the service. In many ways the public is the sufferer from the inevitable lack of unity among the various departments.

Where there are branch libraries the effect of this division of authority is really appalling. First of all, the librarians in charge are likely to be appointed in much the same manner as the main library "heads," that is, without regard to ability or fitness. Mere mechanical dexterity seems to these half-taught "librarians" to be the very essence of perfection in library work, and their own worth and that of those under them they judge solely by the ability to put on labels artistically, or by the number of books charged per minute. That a knowledge of what is in the books is one of the first requisites of librarianship does not seem to occur to them. Necessarily then their first and last resource in reference work is the ever-ready encyclopedia; the boundless treasure of knowledge that lies in other books on their shelves is entirely unknown to them, and unused.

The political evil is almost equalled by another that is rife in some libraries, namely, personal favoritism. Invidious discrimination, unmerited preferment, unusual indulgences, and an entire release from rules and freedom from penalties are the particular signs of this favoritism. Trained and practical assistants, those who have made their work a real study, are often found chafing under the authority of some half-taught man or woman who happens to have the private ear of one of the "board." Nepotism, too, is responsible for many an unsuitable person securing position and promotion out of all proportion to ability.

This, then, is what we find on the other side of library work. Yet, black as is the picture, there are not wanting signs to encourage us. The profession is undergoing

a process of transformation from the state where it was said that when a man failed in every other enterprise he became a librarian, to the present position where experts from every field are attracted, and librarianship is rapidly taking its place among the learned professions. Gradually but surely the abuses and blunders of the early days are being corrected, our library schools—whose graduates are usually women of good breeding—are being drawn upon more and more for trained assistants; our librarians are often men of wide knowledge, expert in the varied details of their profession. The future is bright when we have the assurance that such excellent appointments as have lately been made in several State libraries, and notably in the national library at Washington, are likely to be duplicated. LIBRARIAN.

THE HOUSE OF JOHN MARSHALL.

To the Editor of The Nation:

Sir: I was told the other day in Richmond that the very substantial brick house at the corner of Ninth and Marshall Streets in that city, in which John Marshall lived for forty years, has been bought by the city and is soon to be torn down. I cannot recall any private edifice in the United States—not in the hands of some organization charged with its maintenance—which more truly deserves to be permanently preserved. John Marshall did for the Constitution what Stephenson and Fulton did for steam and Morse and Edison for electricity—he interpreted it, he applied it, he made of it a working instrument.

Let his memory be honored by making the house in which he lived for approaching half a century, the law library of the State of Virginia—or else let it be bought and maintained and cherished by the legal profession of the entire country.

DEWITT MILLER.

Staunton, Va., March 8.

Notes.

Longmans, Green & Co. will soon have ready the following publications: "Modern Organ Accompaniment," by A. M. Richardson; "Introduction to Dogmatic Theology," by Dr. F. J. Hall; "Pain and Sympathy," by Dr. J. N. McCormick; "The Invisible Things," by Rev. J. S. Jones; "Papers of a Pariah," by R. H. Benson; "Woman: her Position and Influence in Ancient Greece and Rome, and Among the Early Christians," by James Donaldson; "Essays in Ecclesiastical Biography," by Sir James Stephen; "Our Sister Beatrice," by Grace Grier; "The Causes of Decay in a British Industry"; "Outlines of European History," by A. J. Grant; "International Documents," by E. A. Whittuck; "His Grace the Steward and the Trial of the Peers," by L. W. Vernon-Harcourt; "Animal Artisans," by C. J. Cornish; "Hunting and Shooting in Ceylon," by Harry Storey; "Electro-Physiology of Plants," by J. C. Bose; "Memories," by Sir Owen Tudor Burne: "Some Problems of Existence," by Norman Pearson; "Six Radical Thinkers," by John MacCunn, and "The Princes of Achaia and the Chronicles of Morea," by Sir Rennell Rodd.

E. P. Dutton & Co. announce the following forthcoming books: "The History of Modern Painting," by Richard Muther; "Christian Theology and Social Progress," the Bampton lectures, 1905, by F. W. Bussell; "Churchman's Treasury of Song," by John Henry Burn; "The Old Country," by Henry Newbold; "George Crabbe," by René Huchon; "Seeing and Hearing," by G. W. E. Russell; "The Pyrenees," by Baring Gould; "The Outlook in Ireland," by Lord Dunraven; "The Carroll Girls," by Mabel Quiller-Couch; "Submarine Warfare," by Herbert C. Fyfe; "Bridge Axioms," by J. B. Elwell, and "The Song in Heaven," by Phillips Brooks.

Henry Holt & Co. have in preparation a new series of Biographies of Leading Americans under the general editorship of Prof. W. P. Trent. The series is to include "Leading American Soldiers" (now ready), by R. M. Johnston; "Scientists," by President David Starr Jordan; "Historians," by W. P. Trent; "Lawyers," by Henry C. Merwin; "Poets," by Curtis Hidden Page, and "Novelists," by John Erskine. Other volumes will be announced later.

This spring we are to have from Funk & Wagnalls: "The Home Life in Order," by Dr. A. T. Schofield; "Balm in Gilead," by Florence Morse Kingsley; "A Post-Scriptum to My Life," by Victor Hugo; "Between the Testaments," by Dr. David Gregg; "Pathways to the Best," by Dr. Charles L. Goodell, and "Race Life of the Aryan Peoples," by J. P. Widney.

A Student's Series of Historical and Comparative Grammars, edited by Prof. Joseph Wright, is to be published by the Oxford University Press. There are to be in all some twenty-five volumes, taking in all the principal ancient and modern languages.

Sir Oliver Lodge's book on the harmony of science and religion is to be issued this month by Harper & Bros.

A. S. Barnes & Co. are publishing the letters written by Charles Battell Loomis to the New York *Sun* under the title of "A Bath in an English Tub."

W. Burdett-Coutts makes a request that any letters written by or to the late Baroness may be sent to him to be copied so far as desirable for use in an official life of that remarkable woman. Writing from her great house at 1, Stratton Street, he says:

> This house is like a record office, stocked with papers and correspondence going back more than 100 years, connected with historic events and great names, and touching innumerable interests. None of these have ever passed outside its walls. Of course, the corollary to this long story is not at my service; the answers, in her own handwriting, that kept her mind and pen busy for seventy years, are in many places.

Sir Henry Burdett's "Hospitals and Charities, 1907," receives its usual welcome. As a step toward securing a single year-book for the English-speaking world, the present issue again contains a chapter by Dr. S. S. Goldwater on hospitals and hospital opinion in the United States.

To the World's Classics Henry Frowde has added a third volume of Burke, with an introduction by Frank H. Willis. This volume is mainly given up to short miscellaneous speeches. The issues of Thackeray are continued with "Pendennis" in two volumes introduced by Edmund Gosse. Holmes's "Poet at the Breakfast Table" and "Professor at the Breakfast Table" have a volume each, introduced by W. Robertson Nicoll. Scott's "Lives of the Novelists" is compressed into a single volume, to which Austin Dobson contributes the introduction.

The fourth volume of Beaumont & Fletcher, edited for the Cambridge English Classics (Putnams), by A. R. Waller, includes "The Tragedy of Valentinian," "Monsieur Thomas," "The Chances," "The Bloody Brothers," and "The Wild-Goose Chase." Mr. Glover observes that differenees have been found in copies of the second folio, all dated 1679, and that the present text has been set up from one copy of the folio, and the proofs compared word for word with two other copies. A few addenda to the notes on the text of volume ii. are given in the appendix.

In 1834 and 1849 Congress purchased the papers of George Washington and deposited them in the Department of State. The transfer was not complete, and much valuable material escaped the notice of the government agents—material that has since been sold to private collectors. What was obtained has been strangely neglected by the government, for no list or calendar was prepared, and, apart from the unfortunate undertaking of Force's "Archives," no publication attempted. Three years ago these papers were transferred to the Library of Congress, and already the first of a series of calendars is printed, covering Washington's correspondence with the Continental Congress. For the first time, therefore, the full richness of the collection can be tested. Nearly 6,000 papers are described, and they constitute only about one-seventh of the entire collection. But this portion is of the highest historical value. Nominally under the direction of Congress, Washington was for some years the centre of civil as well as military administration. He was at times dictator, and yet he always recognized the responsibility of reporting his acts and stating his views to the Congress. He was consulted on questions of army organization, and his relations with the enemy, as on the matter of an exchange of prisoners of war, were determined by resolutions. In the eight years of these close relations a great number of problems were discussed and solved, and nearly as many left without solution. The calendar has been prepared by John C. Fitzpatrick, and is printed by the Library of Congress. A useful feature will be found in the facsimile reproduction of the writing of the aids and secretaries of the general, among whom Mrs. Washington served, as some copies are in her hand. The book is welcome as one more evidence of the policy of the library in making its collections of service to the public.

In a volume, "Cadwallader Colden: a Representative Eighteenth Century Official" (The Macmillan Co.), Miss Alice M. Keys has written a very entertaining account of New York politics before the Revolution. By taste, Colden was a speculator in science, and had he devoted himself more to his experiments, or possessed the same breadth of inquiry and charm of expression, he might have been classed with Franklin. Circumstances drew him into the political and factional differences of the day, and he lost much time and influence as adviser to an unpopular governor. "Too much of a

pedant to be a skilful politician, Colden was yet too much of a politician to be an entirely absorbed philosopher." As Gov. Clinton's supporter, he came into conflict with the Assembly, and with some powerful individuals, capable of neutralizing his well-intended plans of reforms and restraining his personal ambitions. Showing a want of dignity and moderation where his own views were traversed, he did not advance the popularity of the governor, or temper the antagonisms aroused in those scheming for office and gain. A conservative and a believer in prerogative, he could not win favor among a people infected with democratic ideas, and growing restless under ministerial rule. He had to contend against a negligent control of his superiors, a domestic Legislature in which the great landowners were potent, and a people whose growing commerce felt the restrictions of the mercantile system of England. Unpopularity was his reward for his loyalty to King and devotion to the public service. Miss Keys bases her narrative largely upon manuscript material, and writes in a full mastery of her subject. As a result, her work is a valuable study in political biography.

Robert P. Porter's book on "The Dangers of Municipal Ownership" (Century Co.) is based almost wholly upon English experience. As this is confidently adduced both for and against American ventures of the kind, a sound and trustworthy analysis of what British cities have done in the line of municipal trading would plainly be useful. But Mr. Porter has not furnished it. He is a confessed and violent partisan, and too many of the figures which he gives are untested and unfairly collated for inferences dubiously drawn. This we the more regret because we agree in the main with his point of view. But the best cause is not aided by inconclusive reasoning; and the evils of municipal ownership cannot be proved in Mr. Porter's old fashion of proving the blessings of protection—that is, by flinging a lot of undigested statistics together with a triumphant Q. E. D. Nor is his sense of order good. If he were as frank as the seventeenth-century economist quoted by Professor Seligman, he would say, with him, "I have huddled together a mixt Discourse."

Owen Wister's skit, "How Doth the Simple Spelling Bee," has been issued by the Macmillan Company, with illustrations by F. R. Gruger. It is a witty satire on the Simplified Spelling Board and its various activities.

One of the first books published in New York, the Rev. Dr. Richard Lingard's "Letter of Advice to a Young Gentleman Leaving the University, Concerning His Behavior and Conversation in the World," 1696, has been reprinted with introduction and notes by Frank C. Erb of the Columbia University Library. William Bradford set up his press in New York in 1693. In the same year he issued the laws of the Colony in sheets. Under date of 1694 he published an almanac, edited by Daniel Leeds. It is probable that in 1694 he printed George Keith's "Truth Advanced in the Correction of Many Gross and Hurtful Errors." The only known copy of this "Letter of Advice" is now in the Columbia Library. The volume was sold for $12.50 in 1856, and for $240 in 1876; it came to Columbia with the Phœnix collection in 1881. Mr. Erb has given us a line-for-line reprint, not a facsimile. His introduction contains a brief account of Bradford and his press, of the history of this particular book, and of Dr. Lingard, the author. Born in England, probably about 1598, and educated at Cambridge, Lingard became professor of divinity in Dublin University, and died in 1670. In 1668 he published a sermon. The first known edition of the "Letter of Advice" is London, 1671; and there were also editions in 1673 and 1713. The "Letter," though on a commonplace subject, is written in surprisingly vigorous style, with a suggestion of the pith and weight of Bacon.

We have already called attention to the charming little books edited by J. C. Dana and H. W. Kent, and published by A. C. McClurg & Co., under the title of "Literature of Libraries in the Seventeenth and Eighteenth Centuries." Two new issues (the third and fourth) of that series are now before us, containing (iii) "The Life of Sir Thomas Bodley, written by himself, together with the First Draft of the Statutes of the Public Library at Oxon," and (iv) James Kirkwood's "Two Tracts on the Founding of Parochial Libraries in Scotland." Both volumes will have antiquarian value for those engaged in library pursuits to-day. And the dignified sketch of Bodley's life has also a general human interest.

A useful popular comparison between the ethical system of Marcus Aurelius and that of contemporary Christian writers is given by Leonard Alston in his "Stoic and Christian in the Second Century" (Longmans, Green & Co.). The author confines himself to principles of conduct, avoiding philosophical discussions. His treatment of his subject is incomplete in two points: he does not sufficiently distinguish between ethics and religion, and he does not describe the actual moral life of the time in Christian and non-Christian circles. The little volume is, however, fair and suggestive.

The long life of the first Protestant Episcopal bishop of Central New York finds worthy and modest commemoration in the "Memoir and Letters of Frederic Dan Huntington," by Arria S. Huntington (Houghton, Mifflin & Co.). In a career so varied as that of Dr. Huntington's there is much of general interest. Nourished in what might be termed evangelical Unitarianism, and educated by orthodox Congregationalists, he became pastor of a Unitarian church, and subsequently preacher to Harvard University and Plummer professor of Christian Morals. On change of view he was made rector of an Episcopal church in Boston, and later, for thirty-five years bishop of Central New York. Without attempt at formulation of the reasons which led to a change of theological base, or endeavor to estimate the doctrinal positions of Dr. Huntington and his relation to the thought of his time, the biographer has produced a pleasing picture of one of the most conscientious and useful men of the American Church. It may be significant that Bishop Huntington felt a growing ineffectiveness in preaching, as his views became more settled and official cares increased. Outside of his own communion perhaps his most valuable work was in the encouragement of good hymnody.

Prof. Eberhard Nestle of Maulbronn, Würtemberg, one of the most prolific and industrious New Testament critics in Germany, has just issued a critical edition of the Latin text of the New Testament, as a companion volume to his Greek edition published several years ago. The work is done for the Stuttgart Bible Society, which sells these editions at a remarkably low price, the new Latin edition costing only two marks. The purpose is to crowd out the corrupt and cheaply published older editions by offering at the same price a really modern and scientifically correct text. In the case of the Greek text this has been practically accomplished.

In the Beilage of the Munich *Allgemeine Zeitung*, No. 19, Prof. Ed. Koenig of the University of Bonn, discusses the archæological researches made by Prof. Ernst Sellin of Vienna, in three expeditions under his charge, in the ruins of Taanakh, the Taanach of Joshua xii. 21. While the Tigris-Euphrates and the Nile valleys have for decades been furnishing good materials for the Biblical archæologist, Palestine itself, outside of Jerusalem, is largely virgin soil. Only recently have English savants been at work in Tell-Chesi, in the southwestern portion of the country, and later in Geser, south of the road from Joppa to Jerusalem. Professor Sellin has now published a full report of his researches in two volumes of the Denkschriften of the Vienna Academy of Sciences. He has laid bare in Taanakh four strata of ruins, each with utensils and other finds characteristic of four stages of civilization, the earliest antedating the advent of the Hebrews. Among these discoveries are also a series of letters, all, however, of a private nature, and written in cuneiform characters, as are also the famous Tell-el-Amarna letters found in Egypt. Particularly abundant have been the finds pertaining to religious affairs, a large number of amulets and images of gods and goddesses being unearthed. No fewer than nineteen nude images of Astarte are included in this list, as also an image of the Babylonian and Assyrian god Nergal. The most interesting specimen of this class of discoveries is a movable incense altar, found in the third stratum, forty-five centmetres long and ninety centmetres high. Koenig concludes that the data and details brought to light by these investigations are fully in harmony with the reports of Old Testament sources, and tend to confirm the reliability of the literary sources extant for the history of Israel's religious development.

No lover of Italian literature will take up the last volume Carducci sent to the press without a keen feeling of regret. And, indeed, the collection "Antica Lirica Italiana" (canzonette, canzoni, sonetti dei secoli XIII-XV; Florence: G. C. Sansoni), recalls in melancholy fashion the tireless ambition that is now quenched. It was intended to provide an introduction that should kindle in the modern reader the love and understanding of these old lyrics, but the strength of the author's last silent years only sufficed to make the selection of poems and to revise the texts. But as it is, the

book makes a substantial appeal both to the student and to the general reader. We know of no collection so comprehensive and convenient. The philologer may pass by texts that are presented without apparatus; for the student of literature Carducci's name is a sufficient guarantee of accuracy. Such a reader, or for that matter a college class, with the addition of, say, Gaspary's "History of Italian Literature," and Petrocchi's lexicon, will have no difficulty in using the book. For the sake of condensation, it is printed in double columns, but the type is sharp and of fair size; in fact, the general appearance of the page recalls those eminently useful editions of the English poets in single volumes issued by the Macmillans. Of the contents we may only say in brief that there are 164 canzoni and allied forms with 564 sonnets. Every author of repute from the Emperor Frederick II. to Sannazaro is fully represented, and there is an alphabetical table of first lines. A sensible reversion to older and more humane fashions of editing is the publication of poetical correspondences in their original order. Thus one has intact not merely the famous debate in sonnets anent Dante's

A ciascun' alma presa e gentil core,

but also a dozen similar strifes of earlier and later date, down to the rather frigid observations on style, albeit in sonnet form, exchanged between Gaspare Visconti and Ieronimo Tuttavilla. As a very full compendium of the best of the early Italian lyrics, the collection will be most useful to students who read far from great libraries, or prefer their own study corner to the public resorts. To amateurs of the Tudor sonnet it offers especial opportunities, for with Serafino Aquilano and his contemporaries it reaches the poets who, after Petrarch, served as models for Wyatt, Surrey, and their less known compeers in Tottel's "Miscellany." We opine that a careful comparison of the last pages of this anthology with Tottel might even add a few interesting parallels to the many collected by Koeppel and Sidney Lee.

Why Mlle. Thérèse Vianzone should have collected, under the title "Impressions d'une Française en Amérique" (Paris: Plon-Nourrit), her letters to a friend at home, we cannot imagine. In the first place, these letters, written as they are with a purpose of subsequent publication constantly in mind, are by so much not letters at all. But even if they were, their tone of never-ending emotion palls long before the last page is reached. Miss Vianzone saw very little of this country, her environment on the whole having been that of the various convents, women's clubs, and schools before which she lectured in half a dozen great cities. But it would not do to say that she is unobservant! She discovers that Bostou is *un petit noyau de province;* that Alexandria, Virginia, is an important town; that the intellectual development of our women outstrips that of the men; and last of all and greatest of all, that President Roosevelt is a modest and perhaps a timid man.

Col. Corbiu of the French army, who died in 1904, leaving behind a charming volume of "Notes et Souvenirs d'un Officier d'État-Major" (Paris: Hachette et Cie.), was a distinguished officer. He added to capacity for work and to professional ability, literary and artistic qualities of a very high order. Weakened by the hardships of three wars, he passed from the active list, at a time when he could justly count on reaping its highest honors. His recollections, slight though they be, have a charm unusual in military memoirs, if only from their distinction of style. But this is not their only recommendation; his picture of Polytechnique days is delightful in itself, while his account of the assault and capture of the Malakoff, in which he took part, is a model of what this sort of description should be. We can but regret that his recollections should be so brief.

If any layman should doubt that ballooning has become a regularly established sport, let him examine "Le Vade-mecum de l'Aéronaute" (Paris: en vente chez l'auteur), by Georges Blanchet, "pilot" of the Aero-Club of France. Here we have a sufficiently practical hand-book, and a readable one too, on the anatomy of the balloon, its operation and manipulation, in short on what in military parlance we should call its service. These pages open a new world to us, and bear witness to the audacious ingenuity of man. Is ballooning dangerous? Our author says no, because most dangers can be anticipated and met; and he tells us how. For example, if the net, through moisture (and moisture seems to be one great enemy to be feared), should weaken and break, the balloon proper may escape, leaving the aeronaut (temporarily) in mid-air. The remedy is simple: inspect your net frequently, and protect it against damp. We have no space to mention the various points brought out by the author; how a balloon may be "sucked up" by a thunder storm; when it is safe to smoke on a trip; what to say to a peasant when you land in his potato field, and so on. These matters are all realities to the aeronaut, and he must know, and know at once, what to do in each case as it presents itself. M. Blanchet, speaking from experience, is always ready with his solution.

François Coppée has given the Académie Française a sum yielding $200 biennially for use as a prize for young poets. The letter making the gift expresses regret that poets are so little encouraged by prizes in comparison with writers of prose.

Dr. Charles Wilhelm Seidenadel of Chicago presented to a recent meeting of the Philological Society of the University of Chicago selected chapters of his manuscript, "First Grammar of the Bontoc Igorot." The author, who is a trained philologist, associated last summer for several months with the members of a group of the Igorot tribe, about thirty in number, brought to Chicago for exhibition at the close of the St. Louis Exposition. Continuous intercourse with these people, often lasting ten hours each day, enabled Mr. Seidenadel not only to understand their language, but also to converse with them freely. He was successful in transcribing between three and four thousand complete sentences, which he repeatedly tested in actual use, and then subjected to critical examination and classification for the purpose of the "Grammar." The linguistic and ethnological importance of such study is clear, in view of our relations with the Philippines, and of the lack of trustworthy philological work in the languages of the archipelago. Starr Willard Cutting, secretary of the Philological Society, writes:

Mr. Seidenadel's remarkable initial success, his natural gift and special training for making accurate phonetic transcriptions, and his friendly relations with a considerable group of the natives, are, it seems to the members of the Philological Society, strong reasons for expecting from his further research in this direction results of great importance. Mr. Seidenadel hopes to secure from some source the means needed for residence in the Philippines to complete his studies of the Bontoe Igorot, and to extend his attention to other allied dialects.

The Conference for Education in the South will be held this year at Pinehurst, N. C., April 9 to 11.

Professor Skeat has again written to the *Times* a letter of passionate appeal for money to endow a professorship of English literature at the University of Cambridge. He first made an appeal for funds In 1896, and in three years received the munificent sum of £2,100.

The University of Giessen has made arrangements to celebrate in July the three-hundredth anniversary of its organization. The institution was established by the exodus of a considerable body of Lutheran professors from Marburg, when the university at the latter place was changed into a Reformed institution. It was officially reorganized by Rudolf II., May 19, 1607.

From the fiftieth annual report of the public library of Brookline, Mass., we learn that the number of volumes is 64,803 and the circulation for home use 140,666. Its present quarters are so inadequate for the constantly increasing work that a new building is about to be constructed in which the central idea is an open-shelf book room. This proves very conclusively that the open-shelf system, which was adopted in 1898, is not a failure in this town. Out of 84 books missing during the past year, 63 were fiction and juveniles, showing that more careful supervision should be exercised over the children's department, but that the accessibility of the main library should not be restricted.

REPRINTS OF HISTORICAL DOCUMENTS.

Correspondence of William Pitt when Secretary of State, with Colonial Governors and Military and Naval Commissioners in America. Edited, under the auspices of the National Society of the Colonial Dames of America, by Gertrude Selwyn Kimball. 2 vols. New York: The Macmillan Co. $6.

William Pitt was Secretary of State for the Southern Department from 1756 to 1761; and his energy in spurring on the flagging spirits of the colonists in the war against France, together with the brilliant exploits of Amherst, Forbes, and Wolfe, and the final victory of the English in America, has given to the years of his service exceptional prominence. The publication, therefore, of his correspondenee with the colonies during those years is important, and we congratulate the National Society of the Colonial Dames on the share which it has had in this enterprise. The correspondence here printed consists both of Pitt's dispatches to colonial governors and to military and naval commanders in

America, and of the letters and enclosures of the latter in reply. Nearly all the originals now form a part of the British Colonial Office papers preserved in the Public Record Office under the title "America and West Indies," a series of 687 volumes. The Pitt correspondence, covering a period of six years, and scattered through about thirty volumes, deals almost entirely with military matters, and, numbering 493 documents, of which about one-seventh have been printed before, forms a homogeneous group of papers of exceptional historical value. As a documentary history of the colonies during this period of six years this series of papers is manifestly incomplete; but as an introduction to every important episode of the war, including the naval campaign in the West Indies, it is more extensive than any series hitherto published. For the use of students it will need to be supplemented by the printed and unprinted collections in America, by the other departmental papers in the Public Record Office, and by the enclosures belonging to the letters here printed, but not included in these volumes.

The reader who will follow these letters to the end will find vivid and realistic pictures of the campaigns against Louisburg, Ticonderoga, Fort Du Quesne, and Quebec, and will be deeply impressed with the traits of the leaders in the struggle. He will not easily forget Loudon's pomposity and want of tact, Abercrombie's good intentions but ineffectiveness, Amherst's cautious methods and business-like epistles, Forbes's heroism in the face of opposition, discouragement, and wasting disease, Wolfe's enthusiasm and highmindedness, Pownall's common sense and good judgment, Ellis's loyal devotion to colony and home government alike, and Dobbs's rhetorical appeals to the cause of Protestantism and British liberties. He will feel a personal interest in Admirals Holburne, Saunders, Hardy, and Commodore Moore, and above all, he will admire Pitt's determination, military sagacity, and wide geographical knowledge. Among the letters few will attract him more than that bearing for the first time the heading, "Pittsbourgh," and dated November 27, 1757, in which Forbes wrote to Pitt:

> I have used the freedom of giving your name to Fort Du Quesne, as I hope it was in some measure the being actuated by your spirits that now makes us Masters of the place. Nor could I help using the same freedom in the naming of two other Forts, the one Fort Ligonier, and the other Bedford. I hope the name Fathers will take them under their Protection. In which case these dreary deserts will soon be the richest and most fertile of any possest by the British in No. America.

To this Pitt replied, "I cannot conclude without adding my particular Acknowledgements for the very great and undeserved Honor, you have done my Name."

The correspondence discloses the enormous obstacles that lay in the way of conducting a war far from the base of supplies and in conjunction with colonies whose aid was often grudgingly given. The system, established at the Albany Congress of 1754, of requisitioning troops proved wholly inadequate, but as no better plan could be contrived it had to be put in operation. Massachusetts, Connecticut, and New York, acting under the promise of a Parliamentary appropriation covering expenses, gave generous support, but Pennsylvania, Maryland, and North Carolina wrangled over their supplies of men and money to the end of the war. One can hardly wonder that the British Government and its representatives in America became exasperated. To the apathy of the colonies were added other obstacles, too little considered by writers on the subject—insufficient and poor food, heavy mortality due to the unsanitary condition of transports and barracks, inadequate supplies of ammunition, clothing, and camp equipage. The accounts of deputy paymasters, quartermasters, barrack-masters, commissaries, hospital surgeons, and other officials often tell a wretched tale of niggardliness, incapacity, and fraud.

Slowness of communication, not only between England and America, but between colonies also, was a constant hindrance to effective action. Dispatches and letters were delayed by storms or, when merchant ships and packet boats were captured by the French, lost entirely. Waiting for news and orders was maddening to a man like Amherst, and Pitt showed that he realized the seriousness of the situation when he urged the Admiralty to perfect the service and to notify him the instant a packet or merchant ship was ready to sail, that he might keep his dispatches open until the latest possible moment. The post in the colonies was exceedingly unreliable, and generals were left in ignorance for weeks, and sometimes months, of the fate of their orders. "It gives me a great deal of concern," wrote Gov. Ellis of Georgia, "that my letters from the ministry are so long on their way hither." Six weeks after Abercrombie in Philadelphia had ordered Montgomery's battalion to march northward from South Carolina, he could say that he did not know whether or not the battalion had started; and Gov. Lyttleton of South Carolina, receiving on August 2 a letter sent from Philadelphia on May 8, wrote in exasperation to Pitt that "some new regulations in the post throughout the provinces" were "highly necessary for the King's service." Forbes, writing of his scouting parties, said that the intelligence they brought was "of so old a date that there was no trusting to it." Thus campaigns progressed slowly, and individual commanders were compelled to act on their own initiative with such forces as were under their immediate control.

The dispatches that Pitt sent to America confirm all that has hitherto been said regarding his efficiency as a militant secretary of state. They confirm, too, what has generally been overlooked in the estimate of Pitt's ability and statesmanship, the fact that the Great Commoner had no appreciation of the problem of colonial management and no interest in the reorganization of the British colonial and Imperial system after the defeat of France had been effected. There is nothing in his correspondence, here or elsewhere, to show that he desired to change the existing system, to modify the old policy of navigation acts and restrictive measures, or to organize the colonial administration on a more effective basis. He understood the importance of defeating France, but he does not appear to have understood either the probable effects of such defeat upon the colonies, or the need of uniting the colonial dependencies more closely to the empire, a need that Pownall saw so clearly. Though he afterward advocated the repeal of the Stamp Act, there is no good reason to believe that he would have pursued a policy essentially different from that of Grenville had he been in power after 1763.

The documents in these volumes have been well edited, but Miss Kimball's preface hardly meets the demands of the occasion. It tells us a little regarding the origin and present location of the letters, and presents a brief outline of the events of the war; but scarcely anything is said of Pitt's character or policy; no attempt is made to show wherein the new papers enlarge existing knowledge or supplement older narratives; no mention is made of the Pitt correspondence published in 1838-1840, and its relation to the present series; no comments of consequence are made upon the war itself or upon the military abilities of the men chiefly concerned. The notes to the letters are chiefly biographical and geographical, and as such are useful. Inasmuch as it is desirable that such notes be accurate, we make the following comments for use in case a second edition of this work should be called for. In Vol. I. p. 13, the Cherokees are located "along the Virginia border, and in the lower valley of the Ohio River"; on p. 388, they are placed in the "north and northwest of Georgia." The dates of Benning Wentworth's governorship of New Hampshire are 1741-1767, not 1737-1766 (I. 215). Miss Kimball speaks of Amherst as "governor-general of British North America" (I. 219), evidently accepting the statement in the "Dictionary of National Biography" to that effect; but the statement is wrong, unless by "British North America" Canada is meant—a misleading use of the term, inasmuch as in 1760 "British North America" included all the colonies from Nova Scotia to Georgia. Another strange error appears in Vol. I. p. 366, where mention is made of "Charles Pilford, doctor of civil law, governor of the Barbados Islands." A few geographical slips may be noted. Otter Creek should be described as east, not west, of the southern part of Lake Champlain (II. 65); and the terms St. Christopher's for St. Christopher, St. Vincent's for St. Vincent, Prince Edward's Island for Prince Edward Island, and Berbices for Berbice, are not in accord with modern usage.

Original Narratives of Early American History. I. The Northmen, Columbus, and Cabot, 985-1503; II. Early English and French Voyages, 1534-1608. New York: Charles Scribner's Sons. Each $3.00 net.

This series, of which two volumes are now before us, has almost the character of a national undertaking, in that it bears the imprimatur of the American Historical Association, itself a national body. As at present planned, it is to consist of twenty volumes covering the period to 1700; and its object is to render accessible to schools, colleges, libraries, and individual purchasers the great narrative sources upon which rests our national history. If the plan, as it is outlined by the general editor, Dr. J. Franklin Jameson of the Carnegie Institution of Washington, in his Introduction to the series, be carried out with the wisdom and skill displayed at

the beginning, we shall have in the course of a few years within easy reach a mass of material which is not only entertaining and instructive and of the highest historical importance, but which has been read, as a whole, by very few people, even among professed historians. The publication of these narratives in cheap and handy form will meet a need never yet satisfied. Reprints of rare pamphlets have been made for the most part in the interest of the bibliophile on the principle that the more expensive the book the greater the profit. Collections of extracts usually appeal only to those who are required to use such extracted sources as supplemental to a text book in school or college classes. A series that contains such important and alluring narratives as the sagas of the Northmen, the adventures of Cartier, Hawkins, Gilbert, Barlow, and others out of Hakluyt, the observations of Percy, the relations of John Smith, De La Warr, Rolfe, and others for Virginia, Bradford's "History," Winthrop's "Journal," and that remarkable history of Massachusetts by the town clerk of Woburn, known as the "Wonder-Working Providence of Sion's Saviour in New England"—such a series must commend itself at once to a wide circle.

The undertaking opens auspiciously with reprints of the Icelandic and Norse sagas, and of the narratives of the voyages of Columbus and John Cabot, with supplemental letters and other papers. The documents relating to the Northmen are edited by Prof. J. E. Olson of the University of Wisconsin; those relating to Columbus and Cabot by Prof. E. G. Bourne of Yale. No better experts on these subjects could have been obtained. The functions of the individual editors are to supply introductions setting forth briefly the author's career and opportunities, the genesis of his work, and the degree of authority to which it is entitled, and also to make such annotations, scholarly but simple, as may be necessary to explain or correct the text. That editors will of necessity vary in their exercise of these functions is manifest from the fact that Professor Olson gives us an elaborate and altogether satisfying introduction, whereas Professor Bourne contributes only scanty prefaces, and makes his illuminating series of annotations the most valuable portion of his work.

The second volume, edited by the Rev. Dr. Henry S. Burrage of the Maine Historical Society, contains the three relations of the voyages of Jacques Cartier and some fourteen narratives of the voyages of Elizabethan seamen. Though in the technique of editing this volume is inferior to its predecessor, in interest it is not likely to be surpassed by any number of the series, for it is filled with the enthusiasm of an age of adventure, when men were eager to know something of the world beyond the Atlantic, and to see with their own eyes the wonders of the cities of El Dorado. In this year of the tercentenary of the settlement of Virginia such a volume is opportune, for the spirit that led to the founding of Jamestown, though immediately roused by a desire for trade and an increase of wealth, was still the spirit that drove the restless seamen of Elizabeth to seek new worlds to the glory of God, the discomfiture of Spain, and the strengthening of the realm of the English queen.

As the responsibility of selection in this series rests entirely with the general editor, to him must be accorded the praise for the admirable manner in which he has begun his task.

CURRENT FICTION.

The Port of Missing Men. By Meredith Nicholson. Indianapolis: The Bobbs-Merrill Co.

Like a musical motive in its varying phases, inverted, diminished, augmented, changing in rhythm and interval, the Zenda theme marches ever onward and upward and downward. Happy is it for mankind that it is a good theme, healthy and stirring, giving itself naturally to highmindedness, clean sentiment, patriotic feeling, with the harmless necessary spice of treasons, stratagems, knives, and pistols. The fourth time that Mr. Nicholson's charming heroine is the involuntary witness of stealthy approaches and twilight attempts at murder, we are ready to arraign him for lack of ingenuity. But there is, all told, so much of originality in device and so much freshness and lightness in carrying out the design, that one closes the book in good humor with the writer. One remembers even more vividly than the vain repetitions, the sturdy qualities of a military fairy tale. Harder to forget, perhaps, is the unblushing mingling of the real and the false. Against wireless telegraphy and the Senator from Montana are projected the flags at half-mast for the Austrian Emperor Johann Wilhelm, succeeded by Charles Louis, with rival factions supporting a Francis and a Frederick Augustus.

With these slight objections to the scheme of Mr. Nicholson's novel, there is still verge enough for enjoyment of its merits. "Do something for Austria" is said to the hero in the first chapter, and doing something for Austria, mainly in America, is the story. The clash of wits is as bright as that of knives. The accessory characters, as well as the principals, are strongly individual. The machinery is swift-running; the girl, a royal specimen of the emergency heroine just now so popular. And there is an American coloring that is so far from spread-eagleism as to be not in the least out of place, though in an extravaganza, lending it, indeed, a touch of poesy. The name itself is a case in point, designating a Virginian field where for a long time were encamped after the civil war a few "gray soldiers" who would not surrender.

Running Water. By A. E. W. Mason. New York: The Century Co.

To do Mr. Mason justice, his work bears every mark of care. In your mind's eye you see him stepping into the *coulisse* where his *fantoccini* are stored, and painstakingly selecting every puppet and bit of property needed for his story. So obvious is the preparation that you have all the sensations of being at a rehearsal and seeing the stage set with the death-dealing chasm, the catchwords timed to go off opportunely, and everybody's past so illuminated as to leave no question whatever as to the logical future of each. The play begins with a worthless mother trailing her innocent daughter to and fro among Continental watering places. Then come our old friend the British officer, a pigeon to be plucked, two club gentlemen (lay figures even among marionettes), a moneylender, a dark conspiracy, and a gambling father of the most thorough-paced badness, yet with an unquenchable spark of manhood lingering somewhere about his person.

Scene: The Alps (chiefly) and a chorus of Alpine guides. Every one is actuated by those motives found only in fiction. For instance—Sylvia, true romantic heroine, whose sense of duty positively outshines that of the conscientious Elsie Dinsmore, sends off her true love in a huff. Why? Merely that she may have leisure to "save" a particularly trashy, tipsy cub, whom she has just met, from her father and his band of correctly attired bravos. Moreover, no adequate reason is given for her driving away the captain instead of retaining him as her assistant, the only plausible explanation being that if she called him in at chapter thirteen, instead of waiting till chapter twenty-one, even the fertility of Mr. Mason could hardly have prevented their adventures from coming to an end before the volume had reached marketable bulk. The story is told with great fluency—too much, in fact. Throughout it resembles the last act of those congenitally three-act plays to which a fourth is added, to lengthen the entertainment till supper-time. The result is so absurdly stagy, obvious, and trite as to be almost unpardonable from the author of such excellent melodrama as "Miranda of the Balcony."

This Labyrinthine Life. By George Alexander Fischer. New York: B. W. Dodge & Co.

If "This Labyrinthine Life" had been cast as a popular article, appealing to the philanthropic purse on behalf of the war against tuberculosis, it might have been not only endurable, but praiseworthy. As fiction there is little to say for it. The scene is laid in a "lungers'" camp in Arizona; the author treats his subject as if he were writing the yearly report (with picked histories of "cases" to make it lifelike) of a scientific charity. Whenever the details threaten to grow dull, he introduces another group of figures about as clearly differentiated as the "Mrs. X., aged twenty-one," or "Mr. Z., aged twenty-two," of a medical journal. Occasionally this is varied by a discussion upon the later string quartets of Beethoven, or a chat about Thoreau.

Branscombe, a heartless man of fashion, turns philanthropist and endows a model camp, each detail being given with a fidelity rivalling that of "Myself" in the "Swiss Family Robinson." Without further instruction than is offered here, any one of the most limited intelligence would know how to equip such a camp from laundry to pictures. Also, an invalid could do no better than to imitate the admirable behavior of a certain Dick who, although "the importance of alimentation had not at that time received the attention it now does . . . reasoning by analogy . . . made his inferences, and studied dietetics which enabled him to keep his stomach in good condition." White also (the intellectual cynic

of the camp) constantly recalls Rollo's Jonas, as when he explains that "the more concentrated the thinking, the greater the flow of blood to the brain, and the stomach is thereby robbed" or that "superalimentation and nutrition play an important part in recovery."

"And where," one naturally asks, "does the fiction come in?" In the end, to be sure, where it belongs, when one Mlle. Fifine, a Parisian grisette, whose laugh ripples unpleasantly in Branscombe's memory, suddenly crops up in Arizona in the dual rôle of a noble-hearted nurse (after a year's training in Paris) and of the mother of Branscombe's son. Needless to say he is overjoyed to have his domestic cravings so immediately and thoroughly assuaged, and in inducing her to marry him he at one stroke acquires a ready-made family and superintendent for the camp.

Although any effort to rouse interest in the care of consumption is entitled to respect, when a treatise of this kind masquerades as fiction it is as fiction that it must be judged. From this point of view, "This Labyrinthine Life" lacks the vitality of the dime novel without greatly surpassing it in probability or workmanship.

The Dust of Conflict. By Harold Bindloss. New York: Frederick A. Stokes Co.

This long novel opens quietly enough on quiet English soil, yet with mysterious head-shakings and forebodings, full of a fell significance, even to him who runs; and on the twenty-fourth page, in the words of the author, "events commenced to happen." From merry England the action marches across seas to Cuba, and the real thing in bloodshed at the stormy time preceding the recent war. Spaniards of Iberia, of the Peninsula, and the Canaries; Cubans, Chinamen, negroes, mulattoes, Americans, are seething in rebellion and intrigue. Loyalists and insurgents are warring with each other and among themselves. Into this conflict the hero finds himself thrust. The many-sided struggle in Cuba constitutes the strongest part of the novel. Peril, disaster, and rescue chase each other in such quick and picturesque succession as to give the impression of a grown-up boy's book. In the main, the characters stand well apart from one another, and firmly on their own feet as well. If they seem here and there the characters of stageland, it is only to be expected in a war melodrama. The American in an English novel would be hardly recognizable who did not make fearful and wonderful use of his "guess" and his "quite a few"; and though there has been here obvious caution on this point, the skin is still the skin of Esau.

The military conflicts carry more conviction than the moral one which sets the story in motion. Will wise and noble heroes never cease to make senseless sacrifices? Will coroners' juries always be supine, and magistrates self-blinded, and beneficiaries weakly acquiescent? Well is it that there is always the potent American girl who learns the facts and distributes justice with cuffs and kisses. A little pruning of trees and phrases would have been useful, and a blue pencil might well have been drawn occasionally through the heroine's gray eyes. Yet the moral dilemma is well enough as a means of sending the hero to Cuba, and the Cuban part is admirably successful.

A Draught of the Blue; together with *An Essence of the Dusk.* Translated from the Original Manuscripts, by F. W. Bain. New York: G. P. Putnam's Sons.

"And suddenly she raised her face and looked at him with eyes that were full of smiles and tears and shyness and playfulness and blue color and the tremble of the moon. . . ." Where is the prim bombast, the bookish sentimentalism, by means of which the pseudo "Eastern Tales" of Addison and Johnson fortified the West against the enchantment of the East? In the beautiful Indian legends here rendered into English one finds the warmth and light and color and purity of a romantic utterance free from claptrap, though frankly conventional. The English of the version is singularly fluent, simple, and graceful. The Oriental imagery and machinery are never obtruded for their own sake; and the few notes are introduced with no purpose or effect of pedantry. The sole blemish upon the volume is its absurd frontispiece.

A Literary History of the English People. Vol. II. From the Renaissance to the Civil War, Part I. By J. J. Jusserand. New York: G. P. Putnam's Sons. $3.50 net.

It is a great advantage of the plan which M. Jusserand has adopted, that in dealing even with the most barren periods he is able by the judicious selection of material to banish from his pages the dulness which would unavoidably attend the treatment of such periods in a regular history of literature. Certainly there is no period in the history of English literature, with the possible exception of the fifteenth century, less productive of interesting works than that which forms the subject of the greater part of the present volume. The comparative remoteness of England, together with the national temperament, would doubtless have rendered the progress of the Renaissance in that country slow in any event; but the religious controversies of the Reformation retarded it still further, so that fully three-quarters of a century had elapsed after the movement had attained its highest level in Italy before it exhibited a corresponding development in England. It is with this period of fierce religious antagonisms and slow and crude beginnings in literature that the earlier and larger portion of M. Jusserand's volume is concerned. Nevertheless, owing partly to the liberty of selection which the design of the book permits, and still more to an unfailing charm of style, there is not a dull page in the volume.

Until we reach the concluding chapters, which deal with Spenser and the Elizabethan novelists, no attempt is made to discuss with approximate fulness the production of any one author. On the other hand, we have for this earlier period a vivid picture of the intellectual and moral ferment which resulted from the mixed forces of the Renaissance and the Reformation; and this picture embraces the whole life of the time, not merely its literary manifestations. Thus the characterizations of Thomas Cromwell and Queen Elizabeth are quite as finished as those of Skelton or More. One notes in the whole work a learning which is always ready with fresh illustrations of even the most familiar matters, combined with a sense for what is quaint or picturesque and, above all, for what is humorous, especially when the humor springs from some inconsistency of human nature. These well-known qualities of the author, together with artistic sensibility and imagination, give a distinctive charm to his reconstruction of the life of the sixteenth century.

The weakest point in M. Jusserand's volume is his treatment of the "Faerie Queene." The intensity of Spenser's political and religious prejudices has evidently repelled our author, and has led him to take what is perhaps an unduly harsh view of the strange mixture of virtuous precept and sensual episode in that great poem. But Spenser is not the only teacher of morality in whom the artist has occasionally got the better of the moralist—compare, for instance, Samuel Richardson—so that the allurements of evil which call for the exercise of knightly virtue often prove the most interesting part of the story. Surely we may pardon this in a man of the Renaissance. The truth is, that Spenser undertook an impossible task in trying to engraft moral lessons on the Italian romance-epic, such as he found it in the "Orlando Furioso"; and the attempt resulted inevitably in the inconsistency criticised in the present work. M. Jusserand has analyzed skilfully the weaknesses of the "Faerie Queene," the most serious of which, its want of narrative interest, as a whole, even its admirers must admit. In this respect it is indisputably inferior to its great Italian rivals. On the other hand, in passages like The Cave of Mammon and the Claims of Mutability Spenser reaches a height of the poetic imagination, to say nothing of moral vigor, which neither Ariosto nor Tasso ever attained. In failing to lay due stress on this aspect of the "Faerie Queene," M. Jusserand leaves unexplained Spenser's true rank as a poet.

As regards the style of the book in its English dress, we may remark that the natural order of subject and verb is inverted with a frequency which is irritating and opposed to English idiom. On the whole, however, the work is satisfactorily executed.

Newer Ideals of Peace. By Jane Addams. New York: The Macmillan Co. $1.25.

Miss Addams's volume, based on long and intimate acquaintance with the cosmopolitan life of the Hull House district in Chicago, is professedly a study of the "moral substitutes for war." Briefly stated, the thesis is that the world is now turning away from the military ideals and methods which have long predominated in government and society; that the social and industrial difficulties now so prominent, especially in this country, are largely the result of the persistence of military ideals in a period which no longer has use for them; and that the crowded quarters of large cities, where life "must shape itself

with reference to the demands of social justice," are "the focal point of governmental progress." In such centres and among such people, with the every-day conditions of life compelling to union and cooperation, are to be noted the growth of those deeper social influences which make for peace.

The book thus becomes, in reality, a discussion of certain aspects of our industrial and political life as related specially to the immigrant. Our municipal government, for example, still resting on the doctrinaire political ideas of the eighteenth century concerning liberty and the rights of man, fails, in Miss Addams's opinion, to embody the newer ideals of an "evolutionary democracy"; and now that immigration has become industrial rather than political, the city not only fails to care for the immigrant as it should, but leaves him to be exploited by the employer and the political boss under the pretence of fitting him for citizenship. Thus the social habits and prejudices of the foreigner are ignored, and the government which was, in his fancy, to give him freedom, becomes for him an agent of oppression. So with the organization of industry: American government, State or Federal, is slow in affording protection to the laborer, or in concerning itself with industrial conditions, save for the preservation of order; and hence it ministers to the continuance of class antagonisms and the violent protest of strikes. The imperfect and reluctant protection of children and the failure to utilize women in city government are other instances in point.

Miss Addams's observations are so acute, and her criticisms often so well aimed, that her book is worth reading. We cannot but wish, however, that she had ploughed a little deeper, and shown us more clearly how the evils on which she dwells are to be removed. Unless we quite misunderstand her, the militarism which she attacks is only another name for governmental policy in a society organized on a basis of competition rather than on a basis of socialistic coöperation. That government in the United States, as elsewhere, has often been too indifferent to popular welfare; that social classes, themselves the inevitable outcome of competition, have too often been mutually hostile; and that the assimilation of hordes of heterogeneous peoples, all eager to better their positions in life, has been lamentably imperfect, must be admitted. But when we ask for a constructive programme, we do not find any very clear indication of it, save in minor details, in Miss Addams's pages. The panacea of socialism is, indeed, rejected, but the tremendous problem of the relation of government to the mass is still unsolved. We are still compelled to think, therefore, that, imperfect as the performance has thus far been, the practical sphere of government in a democracy is neutral rather than paternal; and that when a government has insured for its people individual liberty in industry and politics, equal rights in law, security for person and property, efficient education, and physical health, it must perforce leave each man to work out his own salvation. This is not to say that everything is all right as it is, or that governmental policy should never change; it is only to enter a demurrer to the rather superficial philosophy which seems to pervade Miss Addams's stimulating book.

Letters and Journals of Samuel Gridley Howe. Edited by his daughter, Laura E. Richards. Boston: Dana Estes & Co. $3 net.

Although there is nothing on the title-page or in the preface to indicate it, this volume is apparently the first of a series in which is to be recorded the life of a notable and interesting personality, Dr. Howe, philanthropist and late husband of Julia Ward Howe, still happily among us. As a young man just through his medical education, he was seized with Philhellenism, and, despite the stay-at-home wisdom of his friends and relatives, went off with but very few dollars in his pockets to fight the cause of Greek independence; he reached Greece only a few months after the death of Lord Byron. Howe went out to fight, but stayed to cure. His medical knowledge was too valuable not to be utilized; he was soon busy as a doctor, and towards the close of the war, when American help came, in the form of food supplies and money, he did noble service in equipping hospitals, searching out the starving Greeks, and starting relief work.

During the five years (1825-30) he spent in Greece Dr. Howe came across most of the leaders of the war of independence, and some of his recorded impressions of them are illuminating; for instance, those of Kolokotrones, Ypsilanti, Cochrane, Hastings, and the Capo d'Istrias. On the other hand, we catch nothing more than remote glimpses of Church, Fabvier, and Trelawncy. In other cases Dr. Howe is not informed as to the characters he meets, nor do the editors of this volume, Mrs. Richards and F. B. Sanborn, who is responsible for what purports to be an historical introduction, help us out. Thus, Count Porro figures under the peculiar transfiguration of Pazzo; and Dr. Howe gets, and gives, a somewhat insufficient impression of the fall of the unfortunate Santorre Santarosa at Sphakteria. This ex-minister of Charles Albert was a marked man for the secret police of half Europe, and when he arrived in Greece with a sentence of death hanging over his head, a copy of his friend Cousin's Plato in his pocket, and hopelessness in his heart, Kolokotrones and Mavrocordato gave him the coolest sort of reception. They accepted his services only after he had assumed the name of Derossi, and it was as Derossi that, sword in hand, he happily found a soldier's grave at Sphakteria.

Dr. Howe identified himself enthusiastically with the Greeks, as may be judged from the following characteristic incident:

> I was once with a party of soldiers, three of whom got separated from the rest, and were surprised upon the plain at daylight by a few Turkish horsemen; they ran for the mountains, but the cavalry pursued them, and fired upon them with their carbines, just as they approached the position of their companions. Two of them fell dead, and the third, hearing the horsemen at his heels, fell also, but not wounded; the Turks came up, dismounted, cut off in haste the noses and ears of all three, the living one having the fortitude to keep up a counterfeit of death, and the Turks strung their prizes on a string, with some others, and galloped off. The poor fellow then got up, and came to us covered with blood from head to foot. I soon cured him, and promised him a new *Taliacotian* nose and ears at the expense of the first of his mutilators whom he should overtake.

Whether the contemplated retaliatory operation was ever performed, history telleth not.

In conclusion, it must be said that the book gives a convincing picture of the conditions of Greece at the time of the war of independence, and introduces us to an American working among these conditions who was a credit to his country for firmness of character, coolness of judgment, disinterestedness, and humanity. At the same time, Mrs. Richards would probably be well advised were she to use the pruning knife more freely in succeeding volumes. There is no index, and the printing and production of the book leave much to be desired.

Scritti editi e inediti di Giuseppe Mazzini. Edizione nazionale. Vol. I. Imola: Cooperativa editrice B. Galeatti.

The publication of this national edition of the works of the republican patriot and apostle of unity, Joseph Mazzini, decreed on March 13, 1904, by King Victor Emmanuel III., is a striking illustration of the progress of concord and unity in Italy. By the provisions of the royal edict an annual appropriation of $1,500 was made, to be continued until the works are completed; and a commission was created to take charge of the editing. By a subsequent decree the following were appointed members of the commission: Rava, minister of public instruction, ex-officio president of the commission; G. Finali, Orlando, Rossi, Boselli, Barzilai, E. Nathan, Pascarella, V. Fiorini, Menghini, secretary. The composition of this mixed body, half-monarchical, half-republican, is in itself significant. Thirty years ago such appointments would have been impossible. To-day, in Italy, many theoretical republicans are to be found, but the period of militant republicanism has passed, and, outside the ranks of socialism, few would advocate a change in the form of the national government. Many of Mazzini's most ardent followers have declared their faithful allegiance to the House of Savoy, as did Garibaldi, and Crispi before them; and Ernest Nathan, whose family has been recognized as the depository of Mazzinian traditions since the days of Mazzini's close friendship with Sarah Nathan, declared his conviction, in a notable address delivered in 1905, that were Mazzini living to-day, he would, in view of the present clerical and socialist enemies of the moral and material unity of Italy, give his active support to the monarchy. The Italian republican party has passed from the realm of politics into that of history, and this definitive edition of the works of its great leader, which is to comprise not fewer than sixty volumes, has fittingly been decreed as a record of its ideals, its sacrifices, its ambitions, which powerfully contributed to the consummation of Italian freedom and unity.

Two important editions of Mazzini's collected works have already been made. The first was published anonymously in three volumes at Lugano, in 1847, "Scritti letterari di un italiano vivente"; as the title indicates, literary writings only were included. The second edition, "Scritti editi e inediti," was begun in 1861, and

the first seven volumes were edited by Mazzini himself, with autobiographical introductions; at his death the work was carried on by his favorite disciple, Aurelio Saffi, who published ten additional volumes; a concluding eighteenth volume came out in 1891, after Saffi's death; and two supplementary volumes of correspondence, edited by the privately organized Mazzinian commission, followed in 1902 and 1904. In this edition vol. ii. and vol. iv. are made up of Mazzini's literary writings, duplicating in great part the publication of 1847, with a few additions and some notable omissions; the remaining volumes of the eighteen are exclusively political. Important single volumes of Mazzini's correspondence have been separately published at different times by Diamilla Müller, Countess d'Agoult, Giuriati, Giannelli, Cagnacci, Melegari, Ordoño De Rosales, and Mezzatinti.

The new national edition will include, besides the rich material of these earlier editions, a mass of Mazzini's uncollected articles and letters, most of which have hitherto remained buried in the memoirs or biographies of his contemporaries, and in countless newspapers and reviews of Europe, together with a vast quantity of unpublished writings, for the most part correspondence. Of the sixty volumes contemplated, five will contain literary essays and reviews, twenty-five political miscellanies, and thirty correspondence. The unpublished material will be drawn from the archives of Ernest Nathan, which alone contain 3,000 of Mazzini's unpublished letters, as well as great bundles of his notes; from the national Victor Emmanuel Library in Rome, and the historical museums of Milan, Brescia, and Pavia; and from a considerable number of other public and private collections. Students who have had occasion to compare volumes of Mazzini's correspondence with his autograph letters will perhaps give almost as much importance to the careful revision of published material, done so far as possible from the original manuscripts, as to the bringing out of new material. Mazzini's handwriting offers unusual difficulties, and collation frequently reveals a score of mistakes in a single published letter.

The arrangement of the sixty volumes will be chronological, and the first volume is consequently made up of literary essays and book reviews, twenty-six in number, written in the years 1826-1833, together with an appendix of six articles of doubtful origin pertaining to the same period. They include several general essays upon contemporary literature, and appreciations of Dante, Carlo Varese, Manzoni, Scott, Botta, Guerrazzi, Salvatore Betti, Monti, Schlegel, Goethe, Foscolo, Giannone, Colletta, Didier, and Victor Ducange. These writings were all originally published in Italian periodicals; but only sixteen appeared in the earlier "Scritti editi e inediti"; the other sixteen, some of which have been until now unidentified, were practically inaccessible to students, as the *Indicatore Genovese* and *Giovine Italia*, in which they were printed, are to be found complete in only one or two Italian libraries. Mazzini, as a literary critic, has been perhaps more highly esteemed in England than in Italy. Dickens, Carlyle, Sterling, Browning, and Swinburne are numbered among his admirers. In his own country his literary reputation has been partially overshadowed by his greater reputation as a conspirator, patriot, and political and social reformer, while his tyrannical subjection of artistic conception to political thought, his unqualified repudiation of the dictum, "art for art's sake," his rigorous methods of judging æsthetic values in their last analysis by moral values, alienated many men of letters, at the same time that they led others to rank him among the foremost literary critics of the century. Although not characterized by the force of his later writings, this first volume comprises essays of distinct merit. No footnotes are furnished, but the excellent preface gives important and detailed bibliographical information. In view of the national character of the publication, the commission has certainly done wisely to refrain from critical comment. It is intended to bring out four volumes in octavo annually, each like this first, of about 400 pages.

British Malaya: An Account of the Origin and Progress of British Influence in Malaya. By Sir Frank Swettenham, late Governor of the Straits Colony and High Commissioner for the Federated Malay States. With a map and numerous illustrations. New York: John Lane Co. $4.50 net.

Pagan Races of the Malay Peninsula. By Walter William Skeat and Charles Otto Blagden. 2 vols. With numerous illustrations. New York: The Macmillan Co. $13 net.

To describe the British method of gaining control over an Eastern people, its failures as well as its successes, is Sir Frank Swettenham's aim. It is a narrative, to a large extent, of events in which he took a prominent part during his thirty-four years of service in Malaya. The first part is mainly a sketch of the history of the Straits Settlement from the occupation of Singapore by Sir Stamford Raffles in 1819, down to 1873. At this time the independent Malay States had become so disorganized as to threaten the security of the British colony; and restoration of order and the establishment of a stable government were absolutely necessary. This result was accomplished, not by force of arms, but by personal interviews with the different rulers, three of whom signed a compact in 1874, agreeing to receive a British officer, "whose advice must be asked and acted upon in all questions other than those touching Malay religion and custom." The instructions issued by the Colonial Office warn these Residents "not to interfere with the minor details of government; but their special objects should be the maintenance of peace and law, the initiation of a sound system of taxation, with the consequent development of the resources of the country and the supervision of the collection of the revenue." It was evident to the men chosen to fill this office and their assistants, of whom Sir Frank was one, that they could succeed only by winning the confidence of the shy and reserved Malay. From his own experience he says that to gain this end a man "must journey with them by land and river and sea; he must take the field with them, join in their sports, listen to their gossip, their complaints, their stories, tend them in sickness, help them when in difficulty, share their sorrows and their joys, respect their prejudices, be kind to their superstitions, and always treat them with consideration. If he does this, and exercises a great patience, he will gain his end, and the end is worth the effort." How the natives themselves feel towards the white man may be learned from a speech of the Sultan of Pêrak at the 1903 conference of Malay chiefs. After giving a graphic account of British intervention and the benefits which the adoption of British methods of government had conferred upon their country, he closed by saying that the people's early suspicion and distrust of the white man had changed into "confidence and lasting friendship."

At the beginning the life of a Resident was not an enviable one. He, with twenty Malay constables, lived in "an old stockade with walls made of logs of wood, piled one on top of the other, a high-pitched roof of palm leaves, very far from watertight, the bare earth for floor. . . . At high tide, *i. e.*, twice in every twenty-four hours, very little of the mud floor was left uncovered by water. The top of the log wall was well above high-water mark, and there one could sleep in luxury, except when it rained, and that was on about half the nights in the year." The pictures of the extensive and architecturally beautiful Government building, which is now the home of the Resident-General in this same State of Selangor, tell more impressively than words what has been accomplished in thirty years.

In obedience to their instructions the first substantial work of the Residents was building roads to connect the tin mines with navigable waters and to open up undeveloped mineral deposits—bridle-paths at the start, then cart roads, and finally railways. Following this came the establishment of hospitals, schools, a postal service, and a banking system. A measure which has contributed greatly to the prosperity of the country was the union of the four protected States in 1896 in a federation. Under all these influences a "waste of jungles and swamps, of mountains and rivers, sparsely inhabited by a far from industrious or happy people, preying on each other" and on the Chinese, has become "a country covered with prosperous towns and villages, with roads and railways, with an enormously increased population, with every sign of advancement and prosperity." At the time of the British intervention the Federated States had never seen a postage stamp, while in 1905 the post-office business consisted of ten million letters, nearly two million dollars in money orders, and over $275,000 in the postal savings banks. Every district has its hospital, and more than 15,000 children attend school. There are 2,500 miles of roads and nearly 500 miles of railway, constructed and equipped "out of current revenue, without borrowing a farthing. Indeed, the Government balances at the end of 1905 amounted to no less than $22,000,000." A striking illustration of the results of an entirely different policy is to be found just across the Straits in Achin, where the Dutch control after thirty-three years of fighting, costing $100,000,000 and 80,000 lives, is not established yet.

The desultory reader will not find in this book much to interest him. A large part is devoted to a detailed account of negotiations with different Malay rajahs and to a history of the development of the Residential system. There are, however, interesting and at times exciting personal incidents narrated; a suggestive chapter is given to a description of the Malay; and the book is made attractive by fifty-four reproductions of photographs. Still, it is a book mainly for the student of Far-Eastern problems. Were the applicants for positions in our Philippine civil service obliged to pass an examination to prove their fitness, "British Malaya" would be an invaluable text-book.

"Pagan Races of the Malay Peninsula," by two former members of the British governing staff in Malaya, is the result of an endeavor to understand the native. It consists of a record of their own studies and observations of the aboriginal tribes, and also the substance of what has been written upon them during the last century. A bibliography enumerates some two hundred sources in different European languages from which the data are drawn. The aim bas been to collect material for a history and ethnography of an important part of Southeastern Asia. The work is dedicated to Chulalongkorn, King of Siam, in acknowledgment of his substantial aid to the Cambridge Expedition of 1899-1900 in the Malay Provinces of Lower Siam under the leadership of Mr. Skeat.

The pagans, as distinguished from the Mohammedans, are divided into three races: the Negritos, or Semang, inhabiting the Siamese provinces; tbe Sakai, and the Jakun in the Straits Settlements and Federated Malay States. The material is classified under Racial Characteristics, Manners and Customs, Religion, and Language. For the first three parts Mr. Skeat is responsible; and Mr. Blagden for the last, which includes an extensive comparative vocabulary of aboriginal dialects, the native equivalents being given for more than four thousand English words or phrases. Though naturally not a work for the casual reader, it is full of interesting incidents and vivid pictures of native life, rendered more graphic by reproductions of photographs. The native's home, his amusements in childhood and maturity, his occupations, religious beliefs, all are described with great minuteness. The result of all these studies is this conviction:

> These despised, persecuted, and (in a worldly sense) ignorant savages, without the guiding star of even the most rudimentary form of letters, philosophy, or history, have yet given us a practical example of the ideal social state, in which liberty, equality, and fraternity are not mere names, but real and living forces, and in which, since a moderately communistic system of property prevails, there is no room—so simple is their form of life—for the disintegrating influences of tbeft, murder, fraud, greed, or any other of the grosser sins that plague the conscience of civilized humanity.

In some tribes murder is almost unknown, and the breach of the marriage tie alone is punished by death. The natives excel also in certain physical traits. Some thirty or forty Sakais were tested for eyesight by the army test-spots, twenty feet being considered an average distance for these spots to be read by British recruits. With these savages the shortest distance was thirty-two feet, the longest ninety-one feet.

Their religion consists chiefly in the use of charms to guard against evil spirits. Some have a conception of a heaven and a hell, heaven being a paradise in the west wherein grow fruit trees of every kind. To reach this the souls of the old and wise must pass across a bridge consisting of the trunk of a fallen tree. This would be easy enough to cross, "but for the fact that at the further end there sat a gigantic figure with only a single nostril, huge ball-less eye-sockets, two immense tusks in each jaw, exceedingly curly hair, and enormously long finger-nails crossed upon its breast. Many of the souls were scared by this horrible demon to such an extent that they fell, panic-stricken, into the vast boiling lake beneath it, up whose sheer smooth sides they tried in vain to clamber. Here, therefore, they swam desperately about, clutching at the sides, for three long agonizing years, after which, should the Chief of the Heaven of Fruit-Trees then think fit, he would let down his great toe for them to catch hold of, and so pull them out!"

It is with sincere regret that we learn from Mr. Skeat that civilization is certain in time to destroy these aborigines, to whose "ingenuity, dexterity, open-heartedness, sincerity, and well-developed common sense," he bears testimony. For their truthfulness he adds to his own experience that of a Malay who once said to him, "What stupid animals these Sakai are, they don't know how to tell a lie!"

The value and importance of the work is greatly enhanced by 300 illustrations, six maps, and appendices containing notes of racial affinities and many texts of songs and charms.

Science.

Skalpieren und ähnliche Kriegsgebräuche in Amerika. Inaugural Dissertation zur Erlangung der Doktorwürde der Philosophischen Fakultät der Universität Leipzig, vorgelegt von Georg Friederici. With map. Braunschweig: Friedrich Vieweg und Sohn.

In this dissertation upon scalping and kindred war customs, we have for the first time a scholarly monograph upon one of the most characteristic practices of our Indians. As is so frequently the case in matters of American ethnologic research, the author is a German—an officer in the German army, and former diplomatic attaché in Washington, widely traveled, and thoroughly familiar with the literature of the subject in every language. The word itself he derives from an old German root signifying a shell. With a few notable exceptions in the old world, the custom of scalping is distinctively American. It was first definitely noted by Cartier on the lower St. Lawrence in 1535, and by other explorers after him along the Atlantic coast southward into Florida. It will surprise most of our readers to know that by careful sifting of evidence Dr. Friederici arrives at the conclusion that the custom was not general at the beginning of the historic period, but was confined to a narrow strip stretching from the St. Lawrence to the Gulf, roughly approximating the territory held by the Iroquolan and Muskbogean tribes and their nearest neighbors. It was absent from most of New England and the coast region to Delaware Bay, and from the whole territory west of the Alleghanies to the Pacific, as well as from the greater portion of Canada, all of Alaska, and everywhere south of the United States, with the exception of an area in the Chaco region of South America. Throughout both Americas the ordinary trophy was the head, and the extension of the scalping practice beyond its original boundaries is ascribed by the author largely to the encouragement given by the colonial governments in offering fixed prices for scalps of enemies, sometimes, as in the case of Massachusetts, as much as £100 per scalp. So late as forty years ago a Western legislature offered bounties for scalps of Indian men, women, and children. The Puritans in 1636 paid for Indian heads, and the Dutch in 1646 for Indian hands. Dr. Friederici is undoubtedly correct in regarding the *coup* as of more importance among the plains Indians than the scalp trophy.

A chapter is devoted to such ghastly trophies as necklaces of human teeth, drinking cups of human skulls, drums and figurines of human skin, more especially common in Mexico, Central, and South America. A comprehensive bibliography and a valuable map make the study complete.

The Harvey Society, an association of New York physicians for the purpose of making the work of the investigator better known to the practitioner, has published a series of "Harvey Lectures" (J. B. Lippincott Co.), being the thirteen addresses of the first season, 1905-06. The range of subjects is wide, from the implantation of the ovum to old age, which, we are told, may be considered to begin almost as soon. The matter presented is particularly interesting to medical men, and consequently for the most part rather special in treatment, but even the general reader, not altogether unversed in science, will find it worth while to examine the lectures on trypanosomes, fatigue, tuberculosis, the cause of the heart-beat, and possibly one or two more.

A new and important departure in animal pathology is the accumulation of statistics as to the cause and prevention of disease among animals in captivity. Knowledge along these lines will eventually lead to a clearer understanding of the life of wild animals, and the causes of disappearance of entire races in past times. A report on 514 deaths during the year 1905 in the Zoological Garden of London has been issued (Proceedings of the Zoölogical Society, 1906, pp. 234-236), where the diseases are listed in tabular form. Of 180 birds, 52 are said to have died from tuberculosis, 48 from exhaustion, 11 from enteritis, and 10 from pneumonia. No fewer than 53 out of 148 primates succumbed to the first dread disease, 21 to pneumonia, and 29 to enteritis. That veterinary science has made greater strides in our own country is shown by the Annual Report of the New York Zoölogical Society for the same year, 1905. Here it is stated that tuberculosis has been almost stamped out, only three primates having died from this cause during the year, two

of which were infected before arrival. At the New York Zoölogical Park bronchopneumonia in the sea-lions and cage paralysis among primates are receiving special attention. A chronic mycosis in birds, with post-mortem signs due to the invasion of the tissues by an aspergillus, one of the moulds, is found in both the London and New York Zoölogical Parks and in such diverse species as ducks and penguins.

Madame Dorothea Isaac-Roberts has just published (*Astronomische Nachrichten*, 4154) a preliminary catalogue of the late Dr. Isaac Roberts's collection of photographs of different celestial objects and regions, numbering 2,485 original negatives. Accompanying the list is an introductory statement, giving a short account of the various classes of negatives, the period during which they were made, and the instruments employed. As soon as circumstances render it possible, a complete list of Dr. Roberts's contributions to astronomy will be published.

The seventh International Congress of Physiologists has been announced to convene in Heidelberg from the 13th to the 16th of August next, with Prof. Albrecht Kössel as chairman. In connection with the congress there will be an exhibition of scientific apparatus.

Frederick H. Newell, chief engineer of the Reclamation Service, has been appointed director of the service, to succeed Charles D. Walcott, who resigned to become secretary of the Smithsonian Institution. Mr. Newell is a graduate of the Massachusetts Institute of Technology in 1885. He entered the employment of the Irrigation Survey, as an hydraulic engineer, in 1888. When the Reclamation Service was established by act of Congress of June 17, 1902, Mr. Newell was appointed chief engineer.

John K. Rees, Rutherfurd professor of astronomy (emeritus) in Columbia University, died on Saturday night in his fifty-sixth year. He was graduated from Columbia College in 1872, and he subsequently received the degrees of A.M., E.M., and Ph.D. For five years he held the professorship of astronomy at Washington University, St. Louis, and for twenty-one years he occupied a like position at Columbia. His lectures attracted large classes, and his simple and clear exposition rendered him extremely successful as a popular lecturer. His influence was most felt, however, by his advanced students, whom he inspired with his own enthusiasm for astronomical research. His public services were numerous. He had been president of the New York Academy of Sciences, vice-president of the American Mathematical Society, secretary of the section of mathematics and astronomy at the 1879 meeting of the American Association for the Advancement of Science, and general secretary of the same association at the 1880 meeting. For many years he was the chief editor of the *School of Mines Quarterly* at Columbia University, and he published numerous monographs and articles on scientific subjects. While secretary of the American Meteorological Society, he rendered his most important service. To him was very largely due the adoption of the present system of standard time. The other great object of the Meteorological Society, the introduction of the metric system of weights and measures, was also furthered by his efforts. In the course of Professor Rees's administration of the astronomical department at Columbia, the late Lewis Morris Rutherfurd gave the university the collection of celestial photographs which he had made in his private observatory in New York. The measurements and calculations of these negatives, which Professor Rees carried out at Columbia, have been recognized by astronomers as the earliest demonstration that the photographic method is at least equal in precision to the best-known methods of direct visual observation. The results obtained from these photographs relate principally to the positions and interstellar motions of the stars composing the Pleiades as well as several other clusters; and parallax measurements of stars in the constellations. Professor Rees's most important contribution to observational astronomy was his extended study of latitude variation and the aberration of light. The methods first used by him in this work at Columbia University have since been adopted by the International Geodetic Association, and are now in general use throughout the world.

Dr. George Bingham Fowler died in this city on March 6. Born in Alabama in 1847, he was graduated from the College of Physicians and Surgeons in 1871. He soon after became assistant in physiology, and from 1886 he was professor of clinical medicine in the Post-Graduate School and Hospital. He founded the *Dietetic Gazette*, and for six years was associate editor of the *American Journal of Obstetrics*. In 1879 he received the alumni prize of the College of Physicians and Surgeons for a thesis entitled "A New and Simple Method for the Quantitative Estimation of Urea." He was the author of numerous articles on medical subjects.

Drama.

The latest illustration of the practical difficulties attending any effort to reproduce the merits of a novel in a stage version of it is afforded by "The Spoilers," an adaptation of Rex Beach's story, which was presented in the New York Theatre on Monday evening. The author himself and James MacArthur worked together upon the transformation, with the usual unsatisfactory results. The book, dealing with an extensive, dangerous, and nearly successful conspiracy, had a good story to tell, and told it with vigor, passion, and much effective local color. It had serious as well as romantic interest. In preparing it for the theatre, the playwrights adopted the common practice of selecting the most exciting incidents, and stringing them together, in as nearly the proper order as was feasible, upon as tenuous a thread of plot as would suffice for that purpose. The great bulk of the descriptive, introductory, explanatory, and qualifying matter—almost everything that contributes to perspective or proportion—was ruthlessly, and inevitably, thrown away. Consequently, the acted tale, with all its most harrowing incidents, and a few more for good measure, packed together in closest compass, with nothing to mitigate or disguise them, reveals itself as ordinary melodrama, exciting enough momentarily in several of its realistic phases, but without any special literary or dramatic value, and with less suggestion of veracity than many a product of pure fiction. Unfortunately, there is a large body of playgoers who are delighted by exaggerated theatrical manifestations of personal prowess, incalculable villainy, or resounding morality, and playwrights often find it profitable to provide them, even at the cost of mutilating and debasing their own conceptions.

"The Major Dramas of Richard Brinsley Sheridan" (Ginn & Co.), edited for the Athenæum Press Series by George Henry Nettleton, assistant professor of English in the Sheffield Scientific School of Yale University, is a compact and careful piece of work, containing a considerable amount of useful information in small compass. It has nothing new, of course, to offer to the student of Sheridan and his period, but for the beginner or amateur it offers a convenient summary of the main features of Sheridan's career and character, his literary, managerial, and political achievements, and of the voluminous critical and biographical notices of which he has been the subject. In the reprint of the three selected plays, "The Rivals," "The School for Scandal," and "The Critic," he follows in the main the text of the late Fraser Rae, and acknowledges many other obligations to the same authority. His chief original work is in the compilation of various speculations as to the sources whence Sheridan may have derived inspiration for his plots, incidents, or personages, the objects of his burlesque and parody and the victims of his personal caricature. The field for such minute inquiries is immense, and the crop of trifling or dubious information to be gathered considerable, but the value of it when garnered scarcely repays the labor of harvesting. Sheridan, as dramatist, wit, satirist, manager, orator, politician, and profligate, has been weighed in many balances and appraised by judges more dispassionate than Professor Nettleton is sometimes inclined to be. The latter, for instance, ignores the fact that Sheridan was for long the mainstay in Parliament of the unscrupulous monopoly which made the British theatre a by-word.

Another handy volume of "The Dramatic Works of Richard Brinsley Sheridan" is published by the Oxford University Press (Henry Frowde). A brief introduction to the text is provided by Joseph Knight.

Ermete Novelli's programme for the first week of his engagement at the Lyric Theatre, which begins on March 18, includes six plays. The only play to be repeated will be "The Merchant of Venice," which will be given on Wednesday evening and at the Saturday matinée. The list for the other days is as follows: Monday, "Papa Lebonnard," by Jean Aicard; Tuesday, "King Lear"; Thursday, "Louis XI."; Friday, "La Morte Civile"; Saturday "Il Burbero Benefico" ("The Beneficent Bear"), by Goldoni.

The German Shakespeare Society will hold its annual meeting at Weimar April 23. Dr. Ludwig Fulda will deliver the Festvortrag.

Music.

The Story of the Hymns and Tunes. By Theron Brown and Hezekiah Butterworth. New York: American Tract Society.

University Hymns. Arranged by Horatio Parker and Harry B. Jepson. New York: A. S. Barnes & Co.

A History of the Choir and Music of Trinity Church. By A. H. Messiter. New York: Edwin S. Gorham.

Hezekiah Butterworth died before he could finish revising his "Story of the Hymns," which had been a popular text book for nearly a generation. The publishers thereupon put the task of completing this labor into the hands of Theron Brown, with the request to combine that book and the "Story of the Tunes" into one volume. The result is a book of 564 pages, which, while by no means exhaustive, notices as many as possible of the standard pieces, with a few others that seem to introduce a new strain. They are grouped under various heads, such as "Hymns of Praise and Worship," "Missionary Hymns," "Old Revival Hymns," and "Sunday-School Hymns," and each hymn is presented with a discussion of its tune, because "like a flower and its fragrance, hymn and tune are one creature." The difference between a hymn and a poem is thus defined in the Introduction:

> A hymn is not necessarily a poem, while a poem that can be sung as a hymn is something more than a poem. Imagination makes poems; devotion makes hymns. There can be poetry without emotion, but a hymn never. A poem may argue; a hymn must not.

Many helpful historic and biographic facts are given; nor do the authors disdain anecdote.

The "University Hymns" are presented with the actual tunes arranged for men's voices. This volume illustrates the advantage of having at a university a musical department with eminent experts. Horatio Parker is one of the six best American composers, and sacred music is his specialty. The task of revising the "College Hymn Book," published twenty-one years ago, could not, therefore, have been put into better hands. Many of the hymns in that collection have been eliminated, and a few new ones added, while in the matter of tunes the editors have departed from the earlier collection so far as to make this work practically a new one. Inasmuch as most hymn-tunes were composed originally for male and female voices combined, covering a range of more than three octaves, the task of compressing them into the range of male voices—two octaves—was one to test the ingenuity of even such a master of technique as Mr. Parker, but he has succeeded admirably, solving different problems in different ways. The result is a book which, "compiled for use in the public and social worship of Yale University," will no doubt find its way to many of our other educational institutions.

The third volume on our list naturally appeals to a more limited circle. It grew out of a series of articles written by Mr. Messiter by way of recording his experiences as organist and choir master of Trinity Church, New York, during a period of about fifteen years. These have been expanded into a full history of Trinity Church music, from the establishment of the parish. "The development of church music in the older countries," the author writes, "has been the work of centuries; we move fast here, and, aided by their experience, have advanced from the crudest beginnings to the highest achievements in about fifty years."

The production of Auber's "Fra Diavolo" at the Manhattan Opera House is an event of more than usual importance, for if the opera proves as successful as the applause lavished on it last Friday prognosticated, it may lead to a general revival of a kind of stage music which, once very popular, has in the last two decades been unduly neglected. While Maurice Grau was manager of the Metropolitan he repeatedly considered the advisability of hiring another house for the performance of works belonging to the school of French comic opera. These operas (by Auber, Halévy, Hérold, Adam) were, as experience had convinced him, too light for so vast an auditorium as the Metropolitan's, while, on the other hand, the ordinary theatres were too small. Since the completion of the Manhattan, however, New York has an opera house ideally suited for precisely this kind of production, as was demonstrated by the very delightful results achieved with "Fra Diavolo," and Oscar Hammerstein has wisely determined to make further experiments in this field, in which his rival on Broadway cannot compete with him. What struck one particularly on hearing "Fra Diavolo" after so long an interval was the perennial freshness of its lovely melodies; seventy-seven years is their age, but not one of them sounds it. We need this French music, too, as a welcome change from the Italian music which is at present being sung here almost *ad nauseam*. Mr. Hammerstein has promised to drop some of it next season.

With the concerts of Friday afternoon and Saturday evening Wassily Safonoff will bring to a close his first season as permanent conductor of the Philharmonic Society. In commemoration of the one hundred and seventy-fifth anniversary of the birth of Josef Haydn, the first musician to compose symphonies in the present sense of the word, the first part of the programme will be devoted to the performance of his symphony in C minor, and the aria "With "Verdure Clad" from "The Creation." The second part of the programme will consist of Beethoven's scene and aria "Ah! Perfido" and the "Eroica" symphony. The two numbers are selected to show the progress made by their composer in the development of the two musical forms, the aria and the symphony, in the short period of thirteen years that intervened between the time in which the Haydn and Beethoven works were composed. Mme. Rider-Kelsey will be the soloist, and to match the Philharmonic Society's imposing body of strings, the wood wind will be appropriately increased for this performance.

The third and last concert of the Boston Symphony Quartet will be given in Mendelssohn Hall on Friday afternoon, March 22, at three o'clock. The programme comprises Debussy's Quartet in G minor, opus 10; Schubert's Trio for piano, violin, and 'cello in B-flat major, opus 99, and Mozart's Quintet for clarinet, two violins, viola, and 'cello in A major (K 581). The assisting artists will be Madame Katharine Goodson, the English pianist, who will at this concert make her first appearance in New York, and Georges Grisez, principal clarinet of the Boston Symphony Orchestra.

The monumental biography of Wagner by Glasenapp, begun more than thirty years ago, is approaching completion. There are to be altogether six volumes, and the fifth is now in the book stores. It covers five years—the period from the laying of the foundation stones of the Bayreuth Theatre to the end of the first Nibelung festival, and the London concerts following it.

Jenny Lind died in 1887. Her husband, Otto Goldschmidt, has just followed her. Born in 1829, at Hamburg, Goldschmidt became, in 1843, one of the earliest pupils of the Leipsic Conservatorium, founded by Mendelssohn, under whom he studied piano and composition for three years. In 1849 he appeared in England at a concert of the Musical Union, and at another given by Jenny Lind. Two years afterwards he was summoned to America to succeed Benedict as conductor of the concerts by Jenny Lind. He married her at Boston on February 5, 1852, and, after a residence at Dresden, they moved to London in 1858. In 1863 he was appointed vice-principal of the Royal Academy of Music. His oratorio "Ruth" was performed at the Hereford Festival of 1867, and was afterwards given in London and in Germany. From 1875 onwards he and his wife were closely identified with the Bach Choir, an organization established in that year and conducted by Mr. Goldschmidt from its foundation until 1885. His compositions, which, besides the work already mentioned, include a choral song, "Music" (Leeds Festival, 1898), a piano concerto, a trio for piano and strings, two pieces for clarinet and piano, and numerous pieces and studies for piano solo, made comparatively little mark.

Art.

Decorative Plant and Flower Studies, for the Use of Artists, Designers, Students, and Others. By J. Foord. Imported by Charles Scribner's Sons. $15 net.

Miss Foord has completed her second series of full plates and analytical details, showing the pictorial elements in forty plants. The whole plant, the striking features of the branches, the details of inflorescence, the structure of the bud and flowers, and so on, are presented faithfully. Many of the drawings are far from what Bauer would have sketched, or from what our marvellous American artist Faxon would have made, but as a rule the plates are true and useful. The coloring is purposely dull, affording a marked contrast to the brilliant lithographs and "three-color process" plates which have recently been published in such numbers. The greens and reds particularly are toned down almost too much, while most of the yellows are quite strong enough. The reproduction is made by what the author calls "a stencil process"—not a clear term. The registering is not perfect, but still the effect is by no means unpleasant. Certain volumes of early Japanese flower-studies, made by what has been described as a block-process,

show results substantially like those obtained by the so-called stencil process, even to the marked restraint in coloring.

The range of selection has been wide and judicious. With the whole of the English garden to choose from, it is not easy to pick out the plants which lend themselves most readily to "conventionalizing," whatever that much abused term may mean; but one would not, at first thought, give preëminence to the sow-thistle, oyster-plant, and marrow-squash. But the discriminating hand which has culled these for pictorial analysis has placed us all under a debt by giving also barley and broom. One can fancy that all of these have been somewhat surprised at finding themselves in the æsthetic company of daffodils and phloxes, wild hyacinths and rhododendrons.

Miss Foord has furnished a good deal of readable matter in regard to the habit and habitat, the folk-lore, and common names of the plants with which she deals, and she has something to say about the early English history of some of them. The proof, however, should have been read more carefully. There are a few bad slips, but only a few are likely to lead astray. We note one mistake which our readers may wish to correct in their copies. *Cobia* is given erroneously both in plate and text as the name of the beautiful, rapidly-growing greenhouse climber *cobæa*. The names of some orders are misspelled.

The volume can be heartily commended to designers as a safe reference-book, and probably students, likewise, can get good out of it; but just how flower-artists themselves are to be helped by it is another matter. No book ought to stand between an artist and the plants he sees.

The leading article in the *Bolletino d'Arte* for February is an account of restorations of early Sardinian churches by Dionigi Scano. These Romanesque and primitive Gothic churches display an unusual simplicity and merit of design. Many, unlike mediæval churches generally, seem to have been carried out upon a single plan within the lifetime of the architect. The churches of San Gavino at Portotorres, of Santa Giusta of that ilk, of San Pantaleo at Dolianova, besides the Church of the Capuchins and of Santa Chiara at Iglesias, are summarily described and well illustrated. For good measure, a remarkable silver crucifix in the Cathedral at Cagliari is reproduced and discussed. It is of the fifteenth century and derives from Catalonian models. The article opens up an interesting and too little known bypath of mediæval art. Federico Hermanin describes a sketch book of Pier Leone Ghezzi, recently acquired by the National Print Room at Rome. This album is valuable for sketches of objects of antiquity now lost, but more important perhaps for Ghezzi's capital portrait caricatures of contemporary dilettanti. It affords a satirical sidelight upon the Eternal City at the beginning of the eighteenth century. For a year past the Uffizi Gallery has been trying to fill gaps in its fragmentary Venetian collection. A Saint Louis of Toulouse, by Bartolomeo Vivarini; a Holy Family, attributed to Cariani; Christ Washing the Disciples' Feet, by Sebastiano Ricci, and two small landscapes, each by Francesco Guardi and Bernardo Belotto, represent this endeavor. The capital acquisition of the year is, of course, the perfectly preserved Madonna, by Jacopo Bellini, which has been reproduced and discussed in several periodicals. Carlo Gamba gives not only a text and photographs for most of these pictures, but also the prices, the moderateness of which might well serve as a warning to the more ignorant and opulent class of American amateurs. Finally, Antonio Salinas writes on the Virgin of the Annunciation, ascribed to Antonello da Messina, which has lately passed to the Museum of Palermo. It is a replica of the version in the Venice Academy. Both are palpably of a later inspiration than Antonello's genuine works. Signor Salinas's suggestion is that we have to do with an Antonello de Saliba, who painted at Messina after his famous namesake; hence used the celebrated signature with a certain justification. Such a double would explain a number of enigmatic pictures that have been too rashly fathered upon the greater Antonello. With its second issue the *Bolletino* quite fulfils its promise of usefulness to students of Italian art.

Admirers of that strange fifteenth-century realist, Guido Mazzoni of Modena, will be interested in an account of certain fragments by him which are described in *L'Arte* for January 30. These remains consist of four terra-cotta busts of a *pietà*—Christ, John and the Two Maries. The manner in which these terracotta fragments came into the Civic Museum at Padua is described by Andrea Moschetti, who has found the original contract. The Pietà, originally consisting of eight figures, was made for the Monastery of San Antonio, Venice, and finished in 1485. Although counted among the celebrities of the city by the older critics, the group fell into disrepair, and when, under Napoleon, in 1809, the site of San Antonio was taken for the Public Garden, there were petitions to save the famous group. On the ground of its bad condition and obsolete style, it was refused for the Academy, and, on their petition, ceded to the Capuchins. These had difficulties with their contractor, through whose negligence or worse the figures were further broken and scattered. The four heads that survive represent the salvage of an intelligent collector of Padua at the time of the demolition.

Negotiations have been concluded between the Italian minister of public instruction, Signor Rava, and the Syndic of Rome for the formation of a mediæval museum in the castle of St. Angelo. The museum will contain a large amount of mediæval material which is now scattered through many different collections and stored by the authorities in buildings that are closed to the public.

Wilhelm Dörpfeld, head of the German Archæological Institute at Athens, has, according to a dispatch from Berlin, discovered in the Island of Ithaca what he believes to be the remains of an Homeric city. Remnants of walls and of monochrome decorated earthenware were found, as well as a number of more elaborately ornamented vases.

The meeting of the International Archæological Congress, announced in the *Nation* of February 14, is for April 10 to 21 of 1909, not 1907.

The National Academy of Design will open its eighty-second annual exhibition in this city March 15 to April 20.

Among the dealers' shows in this city are paintings by J. J. Shannon at M. Knoedler & Co.'s, till March 15, inclusive; John La Farge's recent painting, The Wolf Charmer, at Montross's till March 16; pastel studies of wild animals by Arthur Wardle at the gallery of Arthur Tooth & Sons till March 23; portraits by Ellen Emmet at Macbeth's till March 23; paintings by Maxime Manfra at Durand-Ruel's till March 30; old portraits at Ehrich's till March 31; paintings of the Dutch school at Julius Oehme's; and proofs of mezzotints engraved by Samuel Cousins at William Schaus's. Pictures by Jules Guérin are being shown at Pratt Institute, Brooklyn. The Auguste F. Chamot collection of Chinese art and collection of modern Dutch artists, early English, and modern French schools, and water-colors may be seen at the American Art Galleries. The collection will be offered at auction to-morrow and Saturday.

William T. Evans of Montclair, N. J., has given to the National Gallery at Washington a collection of forty paintings by leading American artists. The gift, to be known as the "William T. Evans Collection," is valued at about $100,000. Owing to the lack of available wall space in the National Gallery the paintings will be temporarily placed in the atrium of the Corcoran Gallery. Among the pictures are examples of George Inness, Homer Martin, Alexander H. Wyant, John H. Twachtman, Winslow Homer, Ralph Albert Blakelock, Louis Paul Dessar, Henry W. Ranger, Francis Murphy, and John La Farge.

At an auction at Christie's in London on February 23 Sir T. Lawrence's Portrait of Miss West brought £4,200, said to be the highest price ever paid for a Lawrence in the auction room. But Lawrence's Marquis of Londonderry brought only £304. Among interesting prices are the following: A. Cuyp, Dutch Farm, with Woman Milking, £3,990; Landscape, with full-length portraits of Pierre Both and his wife, £945; Hoppner, Charles Oldfield Bowles as a boy, £2,310; The Hon. Mrs. William Fitzroy, £1,312; Morland, Happy Cottagers, £2,940; The Gypsies' Tent, £945; Gypsies round a Bonfire, £840; J. B. Le Prince, A Harvest Field, £320; S. Ruysdael, A River Scene, £325; J. Sustermans, Marchesa Guadaqui, £787; Jan Steen, An Interior, with peasants eating, £693; Children Teaching a Cat to Read, £598; Gainsborough, The Market Cart, £630; Reynolds, Portrait of a Lady, in white dress, £609. A drawing by D. Gardner, Portrait of a Lady in white and yellow dress, brought £735.

Finance.

A "RICH MEN'S PANIC."

When prices on the Stock Exchange were declining, last week, 5 to 10 points for active shares; when, at the same time, fresh selling orders pressed on the market in such quantity and with such urgency as to suggest a forced turning of securities into cash—the word was passed around in Wall

Street that this was surely another "rich men's panic." This phrase was common during 1903, when a stock market similar to that of a week ago prevailed from early spring until mid-summer. It was often said that this phrase, as well as that other popular catchword, "undigested securities," was invented at that time; but financial reviews of 1882 contained much about undigested securities, and financial reviews of 1883 talked anxiously of a rich men's panic. This fact makes it the more interesting to inquire what a rich men's panic actually is, in the Wall Street sense, and then to see whether or not the present Stock Exchange situation meets the definition.

A "rich men's panic" is conceived of as forced selling of stocks by capitalists who are so rich that their credit cannot be touched, and who are merely compelled to reduce the burden which they are carrying with borrowed money. Many persons imagine that nothing could force a man worth, say, $10,000,000, to sell his investment holdings against his will, and at a heavy loss. But such a capitalist will usually have placed his $10,000,000 in profit-earning investments—partly in land, partly in his own private business enterprises, largely in stocks and bonds. He will not often leave much of the $10,000,000 idle in his bank. Now, if, when the stock market seems to promise an extensive rise, this millionaire sees fit to acquire more stocks with a view to selling at higher prices, he must borrow the requisite money from his bank—precisely as does the ten-thousand-dollar speculator. Such borrowings are easily arranged; he has but to pledge his real investment holdings as collateral, and he may borrow money enough to buy, say, six or eight millions more of speculative stock. He may even pledge these new purchases, and buy as much more on speculation.

If the price of these new acquisitions rises and he is able to sell at the advance, well and good. If the price does not change to any great extent, he may still maintain his speculation. But if he has wholly misjudged the market; if the price, both of the newly-bought stocks and of the older holdings first put up as collateral, falls ten or twenty per cent. on the Stock Exchange, the ten-million-dollar operator is quite as much forced to "liquidate" as is the petty speculator caught with an "exhausted margin." There are two differences, however, in these two liquidating processes. Small speculators caught in a market of this sort, soon reach the end of their resources and are "closed out," leaving no more forced sales to come from that quarter. The ten-million-dollar man, with his great reserve of investment holdings, may raise sufficient cash, by sales on the Stock Exchange, to reduce his debt and protect the bulk of his speculative ventures. But in so doing, his sale of stocks will not only be long-continued, but will be of a magnitude proportioned to that of his speculative commitments. Therefore, if a number of such wealthy operators have been caught, one might expect prolonged liquidation, indicating sales at a disastrous sacrifice, yet the process unaccompanied by visible signs of individual distress or shaken credit. And this might properly be called a "rich men's panic," in distinction from such markets as those of May 9, 1901, when a sudden and violent collapse in stocks soon ended, injures chiefly the speculators of moderate means whose resources are almost instantly exhausted.

It will be observed that this imagined situation presupposes three things—a rash and blundering venture by large capitalists, refusal of the investing public to take the stocks off their hands, and, usually, a money market which prevents the banks from helping out the wealthy speculators. This was the situation which existed in 1883—when, as we have seen, the "rich men's panic" was first named. Jay Gould and a host of fellow millionaires had indulged in speculation as if the rise in prices and the power of the public to absorb securities were never to change or end. They lost their market, the bank situation grew troublesome, and on the Stock Exchange nearly six months of heavy liquidation followed. Wall Street, with wide-open eyes, repeatedly expressed amazement as to how such throwing-over of stocks could last so long, and how such declines could occur, without causing some one's failure.

Again, when 1903 began, many of the wealthiest capitalists in Wall Street were not only "carrying" stocks bought for speculation, but were involved in "syndicate underwritings," which guaranteed, if certain large issues of new industrial stocks were not taken by outside investors, that the syndicate subscribers would pay for and take up the stocks themselves. These rich underwriters never expected to have to take the stocks; in many cases they knew the stocks were not worth the guaranteed price. But their heads were turned by the experiences of 1901, when the public took the stocks and the syndicates received large commissions merely for signing the agreement—the Steel Syndicate, for example, getting a profit of 200 per cent. in cash for a moderate pledge of capital. After 1901, the public refused to buy the new stock issues; in time, the syndicates were summoned to pay up in full. This was a quite unexpected burden; to meet it—since the new securities were all but unsalable, and since the banks were reducing loans because of impaired resources—these rich operators threw on the market at declining prices, during at least four months of 1903, their reserves of investment securities. Again Wall Street wondered how such declines could occur without causing important failures and how they could last so long. The answer was, it was a "rich men's panic."

That the fall on the Stock Exchange, not only last week and the week before, but in January, was a result of such forced selling by millionaire operators whose ventures had gone wrong, there is little doubt. With all the secrecy habitually spread about Stock Exchange operations, three facts regarding last season's speculation are perfectly well established: First, that capitalists of the sort described were the largest buyers when the market was being stirred to a frenzied rise after Union Pacific's August dividend; second, that they grossly and stupidly misjudged the condition of the money market; and, third, that the outside public did not take from the speculating millionaires the stocks which they had bought for the rise with borrowed money. That the market's recent experience has been as normal a sequel as was that of 1903 or 1883, few experienced observers will doubt. Whether the strain of "rich men's liquidation" will this time continue as long as it did in those two years, is another question.

BOOKS OF THE WEEK.

Annals of the Astronomical Observatory of Harvard College. Vol. LII., Part I.; Vol. LV., Part 1. Cambridge, Mass.

Clark's Labor Movement in Australasia

$1.50 net; by mail $1.63.

"Useful and timely. . . . Mr. Clark will perhaps disappoint alike the extreme radicals who regard Australasia as a workmen's paradise and grow enthusiastic over the progress made there by socialism, and those other extremists who like to be told that Australasia is doomed to bankruptcy and famine and demoralization as the result of socialism and the violation of 'natural law.' He writes judiciously and fairly, and indulges in no extravagant prophecies of either sort. . . . The book is very valuable for its facts and the impartiality with which they, and the conditions to which they are due, are presented."—CHICAGO EVENING POST.

HENRY HOLT & COMPANY, New York.

The Nation.

NEW YORK, THURSDAY, MARCH 21, 1907.

The Week.

The frantic appeals to President Roosevelt to save the railways from the wrath of the State Legislatures ignore one or two important considerations. Men whose eyes are fixed on Wall Street are naturally much perturbed by a fall in stocks; and they seem to think that the whole country is equally worried. As a matter of fact, however, the farmers of the West and the laboring classes generally are pleased, if anything, to see "the Wall Street sharks" get into trouble. These sentiments, reprehensible though they may be, are a force to be reckoned with in politics. If the constituencies of our Western Legislatures were made up of New York bankers and brokers, the events of the last few days might deeply impress the minds of law-makers in Kansas and Nebraska and move them to stay their hands; but such is not the case. The true way to get at the Western Legislatures is to allay the irritation of their constituencies by removing the very ground of complaint against the railways. The restrictive legislation, proposed or actually passed in so many States, is simply the flaming of a long-smouldering hatred of corporations and particularly of railways—a retaliation for a series of vexations and injuries, for the greed, the duplicity, and the unfairness of men like E. H. Harriman The path out of this thicket in which the railways are tangled is not easy, but it is possible. W. C. Brown, senior vice-president of the New York Central Lines, points it out in his demand "for a restoration of public confidence, based upon the widest publicity of corporation affairs and absolute fairness, equality, and stability of rates." In the columns of talk in which our railway managers have recently indulged, no utterance has been sounder or more pertinent. President Roosevelt cannot, if he would, "call off" the Legislatures and Governors. If the rebates, the discriminations, and the injustices continue, Mr. Bryan, Mr. Hearst, or some other man will lead a yet more furious agitation against the railways. But if Mr. Brown and his friends get together in a "gentleman's agreement" to carry out in letter and in spirit the policy of fair dealing which he urges, they will disarm the agitator and the demagogue. On no other terms can the railways secure peace.

The railroads are not alone in refusing to play under the new rules. The owner of a ranch in Wyoming has just decided to sell it because of the new policy regarding range lands. The ranch was large, but its superior size was partly due to the fact that forty-five miles of its fencing was erected on a tract belonging to the United States. With those fences down, the managers of the concern declare that business will be unprofitable. Undoubtedly, there will be other owners to follow this example. When they put up illegal fences, they were only conforming to a general practice which local sentiment condoned. In this matter of the public lands President Roosevelt has an excellent chance to test his old theory that the best way to repeal an obnoxious law is to enforce it. Congress again adjourned without having provided rules for the real needs of legitimate business on the range, in the forest, and the mine. Every new victim of the unfair and inadequate regulations will add an influence to the force that must ultimately secure reform.

In accordance with his bargain with the indicted Mayor of San Francisco, President Roosevelt has signed an order that "Japanese or Korean laborers, skilled and unskilled, who have received passports to go to Mexico, Canada, or Hawaii and come therefrom, be refused permission to enter the continental territory of the United States." For this virtual exclusion of the Japanese the President offers the following reason:

> Whereas, upon sufficient evidence produced before me by the Department of Commerce and Labor I am satisfied that passports issued by the Government of Japan to citizens of that country or Korea, and who are laborers, skilled or unskilled, to go to Mexico, to Canada, and to Hawaii, are being used for the purpose of enabling the holders thereof to come to the continental territory of the United States, to the detriment of labor conditions therein;

We should be glad to know the evidence which proves the President mistaken when he said in his annual message of 1906:

> Here and there a most unworthy feeling has manifested itself toward the Japanese—the feeling that has been shown in shutting them out from the common schools in San Francisco and in mutterings against them in one or two other places, *because of their efficiency as workers.*

We need not argue the rights or wrongs of President Roosevelt's surrender to the basest of our "labor" demagogues. We merely quote again from the President's own words:

> The Japanese have won in a single generation the right to stand abreast of the foremost and most enlightened peoples of Europe and America; they have won on their own merits and by their own exertions the right to treatment on a basis of full and frank equality.

There spoke the true American spirit of fair play and generosity; and the President clinched his argument by the assertion that "It is only a very small body of our citizens that act badly." To that body of offenders the President of the United States now joins himself.

Nothing definite has been given out at Washington about the extension of the trade *modus vivendi* with Germany. It has been assumed that the North Commission succeeded in establishing the basis for a temporary agreement which does not involve change in the tariff schedules. The President has a certain power accorded him by Section 3 of the Tariff Law; but Prince von Bülow is dependent upon the farming element for support in the new Reichstag, and something more than the concession which the President is empowered to make will be needed in order to satisfy the German Agrarians. If changes are to be made fairly reciprocal, they must be in the customs administrative act, in the enforcement of which a considerable degree of discretion rests with the Secretary of the Treasury. German exporters have objected to the method adopted by our customs officials in determining the value of merchandise sent to this market. They have also objected to secret inquiries made in alleged cases of under-valuations. If our customs officials could be authorized to accept as conclusive the valuations which the Germans themselves put upon their exports, the arrangement might well be considered fully the equivalent of any concessions that the German Government may grant to the United States. Paraphrasing Andrew Fletcher, the German manufacturer could say: "I care not what the *ad-valorem* duties of a country may be, provided I am able to make the prices upon which these duties are to be paid."

With every man coming forward with an original explanation of the money stringency and the stock-market panic, it is not strange that the women should begin. An "authority on women's dress," lecturing in Chicago this week, advanced the theory that it is the duty of every patriotic lady, whether or not a Daughter of the Revolution, to buy as many and as costly gowns as possible, and to throw them away after a few wearings. Only so can the mills making dress-goods be kept going, and dividends be paid upon the billions invested. Hence if there is just now "a financial cloud" upon our horizon, let the women hasten to "dispel" it by redoubling their

purchases of purple and fine linen. This financial gospel is as good as any other that praises waste. Logically, it is just as sound as the protective system, or any plan of "making work," instead of seeking to obtain advantageously the products of work. We may smile at this dressmaker dropping into finance, but she is at least as wise as T. V. Powderly, at whose feet our public men were anxious to sit twenty years ago; and her praise of extravagant luxury as the cure for our financial ills has a respectable precedent in Mandeville's "Private Vices a Public Benefit."

The very general expression of goodwill and respect called forth by Mr. Cleveland's seventieth birthday has more than a personal significance. No doubt, the ex-President's qualities are of the kind which wear well with time, and a greater liking for the man has come with the passing years. But the peculiar tribute to him rests on public grounds. People are glad to testify their regard for the type of official embodied in Mr. Cleveland, and for the good causes for which he so firmly stood. In all this, it is not only the interval of time since he left office, but what has happened during it, that has helped his reputation. His fellow-citizens have fresh reason to recall with gratitude his simple, dogged sticking to his duty, without clamor or advertising; his grim determination to keep the rudder true, whether in storm or calm, instead of being both fickle and vehement; his exaltation of the plain virtues; his clear grit in fronting trades-unions; and his veto of a bill to keep out needed emigrants, with no eating of his own words or dickering with discredited labor leaders. Whether by the lapse of time, with its softening of political animosities, or by the force of contrast, it is certain that Mr. Cleveland has come to occupy a high place in the admiring affection of his countrymen.

A plan of action outlined by one of the men connected with the new Russell Sage Foundation is certainly comprehensive. The trustees, according to this authority, may do anything and everything. They may sell life insurance at cost to "poor scrubwomen of middle age, making $5 or $6 a week," send tuberculous bread-winners for a needed rest to the mountains, study the causes of tuberculosis and of "other diseases and social evils," work for the enforcement of the tenement-house regulations or put up model tenements themselves, sell coal, food, and medicines in small quantities at wholesale prices, assist publications connected with charitable work, supply meals and eyeglasses for school children, and other things. This may on the face of it seem too large a programme, even though it was evidently just thrown off in a first flush of enthusiasm; but it is nevertheless well to recognize how wide is the field of effort for social-welfare and how cramping to the spirit of charity the setting up of narrow bounds and rigid standards of action. Says the authority to whom we have referred:

> We used to think that poverty arose largely from defects of character, drinking habits, shiftlessness, and such causes. Now we know that in the complex social conditions it may arise from vastly different causes, and that an upright, average citizen may find himself "up against it" really through no fault of his own.

We confess to disappointment with the majority report of the Committee on Athletic Sports of the Harvard Overseers and Corporation, adopted last week by the Overseers. The twelve recommendations are all worth while, but none of them is thoroughgoing. To cut down the expenses, to complete the payments on the far too costly Stadium, and to finish the development of Soldiers' Field, to endeavor to do away with professional coaches by coöperation with other colleges, to encourage undergraduates to take interest in the management of athletics to reduce the number of intercollegiate contests—all these reforms are well enough. The pity is, however, that, unlike President Eliot, the joint committee of the Overseers and Corporation has not a word to say about the brutalities of football, the excesses which follow in the train of intercollegiate contests, or the general unsettlement of college ideals and habits as a result of disproportionate attention to athletics. To Moorfield Storey belongs the credit of submitting a minority report. He does not believe that the recommendations of the majority, while steps in the right direction, are adequate. He urges the abolition of football, and he would have the Athletic Committee subject to the authority of the Faculty of Arts and Sciences. The college teachers know best what athletics means; yet, as they have no control over the Athletic Committee, they can have no direct influence upon the conduct of the games. Mr. Storey's point, that recommendations like those now adopted have been of little or no avail in the past, is well taken. It is an educational cancer with which Harvard has to deal—at least so far as football is concerned—and Columbia University alone has shown how to operate on it radically.

The situation in Central America is perfectly simple. Honduras is at war with Nicaragua over a strip of territory which both sides own and both sides agreed to submit to arbitration. Both sides are winning; the Nicaraguans have apparently occupied the capital of Honduras and the Hondurans seem to have occupied the capital of Nicaragua. Evidently, then, all that is left to be done is for the combatants to turn about and fight their way back after President Zelaya of Nicaragua has recognized the revolutionary government of Honduras and President Bonilla of Honduras has recognized the revolutionary government in Nicaragua. President Zelaya, of course, is an enemy of President Bonilla, because President Bonilla overthrew an earlier President Bonilla of Honduras, who was a friend of President Zelaya and had helped him overthrow *his* predecessor. Salvador is getting ready to join Honduras, in which case Guatemala will join Nicaragua, in which case Costa Rica will join Salvador and Honduras, in which case the Big Stick——

Monday's dispatches announce the expected arrival at the Abyssinian capital of a French mission to "confer with Emperor Menelek on a railway building project." Presumably, the object is to treat of no new undertaking, but to facilitate the construction of the railway already projected from Jibuti to Adis Abeba and, by the end of 1903, completed over the first section from the former point to Diré-Dawa, some forty miles from Harar. Beyond that point the progress of the railway was, in spite of a liberal Government subsidy, blocked by the financial difficulties of the French construction company, and by the hostility of the Abyssinian Emperor, who was supposed to be acting under British influence. The agreement of April 8, 1904, in ranging Great Britain on the side of France, removed the second obstacle to the progress of the railway, and on December, 1905, it was reported that work had been begun on The Harar-Adis Abeba section. The financial question, however, remained a pressing one. Public opinion in France was greatly exercised when it was discovered that the French construction company had practically mortgaged itself to the International Æthiopian Railway Trust of London, and that a national undertaking was in danger of falling into foreign hands. In 1906 an agreement was concluded between Great Britain, Italy, and France, providing for the internationalization of the railway, with a predominant French control. The third section of the railway from Adis Abeba westward is expected to join the Cape-to-Cairo railway, which will run through Abyssinian territory.

If the recent dispatch announcing the virtual conclusion of a commercial agreement between Belgium and the Netherlands be correct, negotiations must have been carried on with a degree of haste and secrecy exceptional in such circumstances. The union of the

two countries in a *Zollverein* has long been advocated in both, but up till recently the scheme was regarded as more or less utopian. On the face of things, an alliance between the two Rhine and North Sea States would greatly change the political situation in Northwestern Europe. Germany, for instance, or at least the Pan-Germanists, would have to reckon with the opposition of some thirteen millions of people, of whom the greater part are by no means anxious to be deprived of independent political existence. Public opinion in France has naturally favored the proposed economic union as tending to throw the weight of the French-Belgian population against the German influence in Teutonic Holland. The gain to the two parties to the contract would be reciprocal. Belgium might find in the Dutch East Indies a market, a source of raw material, and a valuable *point d'appui* for a commercial campaign in Eastern Asia. The Netherlands would be in a position to discount the growing rivalry both of the German and Belgian ports. Antwerp, as a result of magnificent dock and river improvements, has been spoken of as the leading European port of the near future. The commercial rank of a Dutch-Belgian *Zollverein* would be above that of Germany and the United States, and second only to that of Great Britain. In 1904 Holland's total commerce was valued at $1,760,000,000 and Belgium's at $1,655,000,000.

Of the situation in Russia, not the least puzzling feature is the militant attitude of the Social Democrat deputies in the Duma. While the Constitutioual Democrats, the peasant deputies, and the Socialist Revolutionaries have been exhibiting a degree of self-restraint which last year would have brought down on them the ugly name of reactionary, the Social Democrats have manifestly been spoiling for a fight from the very opening of the Duma. And yet in theory it is not for the interest of that party to bring about a breach with the Government so long as there is hope of securing partial coucessions in the form of real liberty of speech and the press. The Social Democrats are followers of Marx; it is their creed that Russia must pass through the cycle of economic evolution traced by that thinker, before she can be truly free. That is, she must become industrial and capitalistic as the nations of the West have become, before the perfect, Socialistic state can be established. But such a process is purely economic. Whether Russia's government in the meantime is a Constitutional mouarchy or a republic should make no difference to the Marxian theorist, provided he be given the right to proclaim his theories by word of mouth and in writing, and to work for them through some form of representative government. It is curious, then, that when the auspices are not unfavorable for the establishment of a tolerable régime in the matter of freedom of political conscience, the Social Democrats should be anxious to wreck chances of a compromise with the Government. A possible explanation may be found in the fact that the second great party of the Radical Left, the Socialist Revolutionary-Group of Toil (peasant) combination, has gone over to a policy of moderation. This also is, theoretically, an anomaly, inasmuch as the Socialist Revolutionary ideal calls for a complete social upheaval *at once*. Why should they be willing to debate amnesty and freedom of speech when their aim should seemingly be to bring things to a crisis, even if it be a bloody one? One reason probably is that the peasants are evidently not ready for an armed conflict. Time must be gained, and some constructive work must be accomplished in the Duma in order to retain the party's hold. This reason does not count with the Social Democrats. Their strength is among the urban workingmen who are as revolutionary as they have ever been; besides, this is the party's first official appearance, for it was practically unrepresented in last year's Duma. Hence it must try its lungs and shout a bit as Aladyin and his followers did last year.

Elections were held for the Finnish Diet, last week, and women not only voted on a full equality with men, but had no less than eighty candidates in the field. The Diet is no longer a body of four estates and chambers, but a true National Assembly of one house elected by universal suffrage. Finland's vicissitudes under Nicholas II. have been as remarkable as those of any fabled child of fortune. Self-governing up to about the end of the nineteenth century, enslaved by the Russian autocracy in the course of the next five years, she took occasion of the general strike in Russia in October and November, 1905, to recover her liberties practically in a single day; and not only that, but to establish a completely democratic régime. Evidently the Finns are blessed as few nations on earth with a genius for political progress through peace. Less than a year ago at the time of the Sveaborg mutiny, Finland had a socialistic Red Guard and a conservative White Guard, and civil war seemed imminent. To-day, we are told, "the most acute question before the electorate is that of the total prohibition of the sale of liquor."

Irish measures are soon to engross the attention of Parliament. Chief-Secretary Birrell announced last week that the Government bill granting Ireland a degree of home rule would be introduced soon after Easter. As a preliminary, the Ministry proposes to repeal the Crimes Act. This is the special criminal procedure devised for Ireland, the application of which always makes the blood of Irishmen boil, and embitters them against England more than any other grievance which could be mentioned. Irishmen do not like to be put beyond the pale of the ordinary law, any better than did our colonial ancestors. It is some time now since the Crimes Act has been enforced. There was no occasion for it during the last years of the Balfour Government. Since the Liberals came in, it has been, as Mr. Birrell has declared, "dead and buried"; but the Unionists object to having it removed from the statute books. It doubtless will be, however. Englishmen could give Irishmen no better earnest of an intention to treat them fairly.

An echo of the Longfellow Centenary comes in the form of a letter to the London *Spectator* from the Rt. Rev. H. C. G. Moule, Bishop of Durham. He notes, as have many Americans, that in a recent patronizing and pretentious review, Longfellow is described as "chiefly read and valued to-day by children, and by the men and women who have never passed their mental childhood." The Bishop of Durham, however, confesses to "a recent access of delight" in Longfellow's thought and diction, "during a short time of enforced leisure, and of that sort of fatigue which asks for literature at once charming in form and gentle with the gentleness which comes, not of the weakness, but the sweetness of the mind." The Bishop, going over verse with which he had been familiar for years, and also over certain poems that were new to him, was "struck, not only with the sweetfulness of the poetry, but with its frequent brilliancy and perfection of diction." This appreciation of Longfellow by a man of wide reading and cultivated taste, is simply fresh proof—though none is needed—that youth and impudence, often such attractive qualities, are not the making of a sound critic either in art or literature. It is easy to be young and cocksure; to declare from the fulness of your ignorance that this unknown author is the greatest of the age, and this established classic the worst. If you do this with sufficient vivacity of phrase in the newspapers and the cheap magazines, you can make a tremendous noise and acquire a reputation for omniscience—among your intellectual inferiors. But to discriminate is harder; to understand and value the excellences of a poem may require some background of literature, some standards of comparison. All of which truth is inevitably wasted if cast before the unabashed youths who need it most.

THE DREAD OF DISARMAMENT.

Apparently, each armed nation fears nothing on earth except a discussion of disarming. The series of protests against so much as mentioning the subject at The Hague Conference is getting pretty long. Austria cannot bear the thought. Germany shrinks back affrighted at the very idea. In France, the "pacifists" are denounced as the plague of mankind. Behind the English Premier a political and Jingo back-fire is being kindled, to lead him to abandon, if possible, his humane proposal. What the opinion may be at Washington, the world has not been informed; but from many previous utterances we infer that it would not be unlike that of the German Government as reported on Saturday:

> Because of the sincerely peaceable sentiments which prevail in Germany, the proposal to disarm contains for Germany much that is enticing. The closer one examines it, however, the stronger become the objections to the proposal itself and its treatment by international arrangement.

This is certainly a novelty in human affairs. To bring up a proposal which all hands agree to be excellent in itself, to be, in fact, a matter both pressing and enticing, and then to concludo that it must not be even debated at a gathering of all the parties interested, would surely impress an observer from the planet of the god of war himself as an example of perverse reasoning. The attitude is more than paradoxical; it is outright whimsical. It is as if all the strong men armed in the world stood up and, in the spirit of Bismarck, boasted that they feared nothing but God, but when a few weaklings invited them to consider the limitation of armaments by international agreement, should then betray the greatest alarm and say that they could not answer for the consequences if any rash delegate should even lisp the word disarmament at The Hague.

These fears are not only comic, hut belated. It is no new thing that has suddenly been thrust upon the astonished nations. Proposals to disarm, or at any rate to reduce armaments and their crushing hurdens, date hack at least forty years in European diplomacy. They were put at the very front of the programme for the first Hague Conference. As Sir Henry Campbell-Bannerman shrewdly argues, if it was not a folly or a crime to urge their discussion then, it cannot be now. What has happened since, to work the change? When people talked before about the Czar Disarmer, there were those who joined in the unmanly suspicions to which Kipling gave coarse expression in his "Truce of the Bear"; but even the most inveterate enemy of Russia could not now picture her as scheming to weaken her rivals so that she might catch them unawares and strike with her own military might undiminished. And if it be said that no appreciable result followed the discussion of disarmament in the first Conference at The Hague, is that a good reason for dreading its debate again this year? If the arguments against disarming are so overwhelming, the champions of great navies and big battalions should jump at the chance of meeting their enemies in the gate and routing them. This nervous fear of even speaking of the subject above a whisper will make the world think that they are not so sure of their case.

These timid warriors base their objections, they say, on "practical" grounds. There are so many other important measures to come up at The Hague that it would be a pity to take up time uselessly in talking about an international agreement to limit present armaments, or to refrain from enlarging them. This was the position taken by Chancellor von Bülow last January. No one could be more peace-loving than he, but he added, with his ready turn for French phrase, *qui trop embrasse mal étreint;* and intimated that the Hague Conference would be more useful in debating how to care for men wounded in war, than how to prevent their being wounded. But it is a new doctrine that there is harm in even talking about a measure which poets and seers have dwelt upon for generations, and which philanthropists versed in affairs and jurists skilled in international law have been in recent years more and more coming to think not only ideal, but within reach.

For our part, we do not believe that, however the official programme may be clipped and guarded, the subject of disarmament can be kept out of the Hague Conference. Grave diplomatists will not forever be content to deal with the incidental without going back to causes. As civilization advances into our West, men give up going about as walking arsenals, and leave to the police and the courts the protection of their property and the maintenance of their rights. But nations, we are informed, cannot show as much sense as individual Bill and Jake and Hank, but must carry three revolvers in the belt and a knife in each boot and a shotgun slung across the back, and must, moreover, refuse even to discuss the advisability of getting rid of their fighting impedimenta and acting like civilized beings.

THE TROUBLE WITH WALL STREET

So violent a collapse in Stock Exchange prices as has just occurred, following a three months' decline which had itself cut 10 to 25 per cent. from foregoing values, is generally ascribed, by intelligent men, to the previous condition of the stock market itself, to the state of the money markets, here and abroad, to the financial and commercial outlook generally—in short, to the economic situation which of necessity governs the price of stocks. It appears, however, that some of our present-day experts find themselves able to do without such humdrum reasoning. Certain of our quidnuncs announce the highly interesting discovery that "the country's values are no longer dependent solely, or even chiefly, upon economic factors"; and that the trouble is due to proposals for legislative regulation of the railways at Washington and in the States.

Now, it must be conceded that reasons which waive all financial causes for a financial phenomenon, are something new in the study of economics. We might also remark, if disposed to cavil, that the great part of the restrictive legislation, which, to the exclusion of all other causes, is crushing stock markets, was pending or proposed in the months of last autumn when the stock market, under the reputed lead of railway "magnates" themselves, was advancing by leaps and bounds. But this point we shall not labor. If the assertion that nothing but "hostility to railroads" is responsible for the break in stocks be true, then by all means let the facts be known. If it be false, no time should be lost in ending the mischievous delusion. A blundering diagnosis, when the patient is suffering severely, may do incalculable harm.

Looking at the situation in the broadest way, we can cite at least four reasons for the recent phenomena of the Stock Exchange. Let us grant that the "anti-railroad demonstration," especially as described and denounced by railway officers, has operated not only to deter investors from buying railway stocks, but to cause actual selling. A banker familiar with the recent situation would undoubtedly add to this, first, that Stock Exchange values were forced up, last autumn, to a level where the yield to investors, at the price, was barely half what capital could earn elsewhere; second, that recent public disclosure of sharp practice in railway finance, hy important railway "insiders," had spread distrust of their methods in the market; third, that the money market, at home and abroad, was in a highly abnormal condition, calling for some relief, which might be obtained through reducing the burden of Stock Exchange liabilities.

We shall not assert that any one of these well-known influences is paramount. We would, however, draw particular attention to the money market, because, in the view of all expert financiers, that is the phase which is most perplexing, and which, in its eventual bearing on all markets, cannot fail to be fundamental. It is now more than a year since all great money markets of the world—our own and London's notably—began to show signs that

capital was overstrained. Last year's New York money rates and bank reports repeatedly betrayed the weakest position shown at the time of year in more than a quarter of a century. The Bank of England's discount rate, the index to London's financial condition, was kept for thirteen weeks at the maximum figure of the past thirty-three years, and is now at the highest quotation reached during March in a still longer period; while the Imperial Bank of Germany, which largely reflects the Continental markets, held its rate throughout February at the highest figure ever maintained during that season.

These are well-known facts, and they are not new. Competent bankers and financial critics have been calling attention during eighteen months to the progressive development of the strain on money. We do not recall this in order to excite alarm; on the contrary, we believe that the long and persistent forcing of these facts on the attention of the investing public and Wall Street has greatly diminished the possible danger of their consequences. Whatever else may be said of the present situation, it has not caught financial and business communities off their guard. Even the Stock Exchange has been fully aware of the state of things, and it would unquestionably have been better prepared for all possible results but for last autumn's reckless attempt to stir up a wild "bull movement"—an action credited, rightly or wrongly, to some of the very men who are now crying loudest that the whole trouble lies in "hostility to the railways."

Through no merit of these people, the mischief they caused—which, in its ramifications, extended even to European markets—has been in large degree counteracted. Stock Exchange liquidation, the puncturing of Wall Street bubbles, the release to legitimate trade of capital improperly tied up in speculation, have corrected a great part of the evil. In the financial markets, this is a time to be careful and observant, but it is not necessarily a time to be pessimistic. It was in last September and November, when our high financiers were speculating for the rise and advancing dividends right and left, that the financial horizon was really blackest. None the less, when markets are so disturbed and uncertain as to-day, it is not an occasion for loose experimentation.

THE HUNGER-STRIKE.

The strike as a political weapon has been improved and utilized to an amazing extent during the last few years. In various forms we have had it in Europe and in Asia. China has made use of the commercial boycott against America. The natives of Bengal have refused to purchase British manufactures as a protest against alleged misrule. The inhabitants of Teheran wrested a Constitution from the late Shah by deserting the capital *en masse*, and thus threatening to leave their ruler absolute, but in a vacuum. In Russia, of course, the foundations of liberty were laid by the great general strike of October, 1905; and in Austria the threat of a general strike was sufficient to drive the Government into granting universal suffrage. Whatever complexion these different movements may have assumed, they were all alike in recognizing the advantages of passive resistance, for a weak cause, over protest by force, and of the principle of abstention over that of action. Probably the latest development in this field is the so-called "hunger-strike."

At the opening of the University of Lemberg in Austrian Galicia in the latter part of January, there were violent demonstrations as a result of the refusal of the Ruthenian students to take the prescribed oath in Polish as heretofore. The Ruthenians in Galicia constitute the bulk of the agricultural population, and are tyrannized over with quite as much consistency by the Poles as the Poles are by their German masters in Posen. About eighty Ruthenian students were thrown into prison, and held for more than three weeks without trial, until they resorted to the proclamation of a hunger-strike. It lasted three days, till it succeeded in attracting the attention of the outside world. The Vienna press protested against the outrage, and the "strikers" were released.

Russia, which has enjoyed exceptional facilities for developing numerous forms of resistance to oppression, has made most extensive use of the hunger-strike. George Kennan, in his "Siberia," speaks of the practice as common among the Russian exiles when the tyranny of their jailers has become intolerable. A more recent illustration, falling within the last few months, aroused attention in this country. It came in connection with the death of a woman revolutionist who was killed by a sentinel, without provocation, while looking out of the window of her cell in a St. Petersburg prison. When the news had circulated through the other cells, after the mysterious manner of intercommunication developed by the Russian revolutionists, the prisoners demanded that the body of the victim be shown to them, and, when this was refused, proclaimed a hunger-strike. The affair became known, and such was the feeling of horror in the capital that a Government whose record for nearly half a year has been five executions by drumhead court-martial per day, saw itself forced to grant the demand of the "strikers," and to take steps for the punishment of the authorities responsible for the murder.

The inner idea of the hunger-strike goes further back than Russia, however. It is the conception which underlies the hara-kiri of the Japanese, that of inflicting upon ourselves the punishment which we are powerless to visit upon our enemy. Resistance to attack or injury is a primal instinct, and our ordinary defensive efforts are mechanically reactive. When the Oriental or the emotional Westerner smites his breast, or wrings his hands, or tears at his hair in the face of calamity, it may be due largely to the fact that there is no physical enemy present to receive the impact of fury born of injury and pain. But undoubtedly there is also present in the theory of the hunger-strike the primitive fear of innocent blood on one's hands. "My blood on thy head" is an ancient invocation. By innocent we mean, of course, non-resisting. The slightest exhibition of force may be enough to justify a man's tyranny in his own eyes, but absolute passivity, while it may drive him to fury, robs him also of ease of conscience. Instans Tyrannus, in the end, did grow afraid.

The idea is not without its application to present conditions in Russia. The Russian peasant, for instance, even in times of good crops, is underfed; but when statistics show that prosperity prevails, he is regarded as a fit subject, not for sympathy, but for heavier taxes, Cossack raids and punitive expeditions, floggings, exile, and execution. If he rises in insurrection, it is because his blood is too high from overfeeding. But against a peasantry stricken by famine and plague, even knout and court-martial dare not continue in play. Thus there is no paradox in the statement that the present Russian famine is for the best of the country. We have not a strike in the technical sense, but the inevitable result of intolerable conditions for which the autocracy is largely responsible is as powerful an indictment and appeal as though the twenty millions of peasants had voluntarily condemned themselves to starvation. Coming at a critical moment in the conflict for political and social reconstruction, the *mujiks* starving in their villages are a greater force for liberty than they would be half-fed and half-armed in the field against the Czar's soldiers.

HOBBLING BACK TO NATURE.

In this country, and pretty nearly all over Europe, a cry of "The People Back to the Land," or "The Land Back to the People," is being sounded mightily at the present time. The phenomenon is of regular recurrence. Whenever the flood-tide of prosperity subsides sufficiently to give us time and occasion to think, we begin to study our falling birth-rate, our increasing slum and criminal population, the iniquities of the food adulterator and of the yellow press, and

become convinced that we are well on the way to ru'n, and that the city is responsible for it all. Check the drift to the city, return to the poor, old, hackneyed "simple life," we demand in a moment of contrition that is probably as sincere and as lasting as the ordinary mood of repentance. In France, Maurice Barrès, René Bazin, and others have shown what a source of weakness to the nation are the "uprooted ones,' whom the whirlpool of Paris has sucked in from the provinces to their undoing and her own. In Great Britain they have been suffering from intermittent panic over the possibility of a war that shall cut off her oversea sources of supply and leave her without an agricultural population to feed her. In Italy the rush to the towns, coupled with emigration, is denuding the field and paralyzing agriculture. The city is becoming the enemy of the race.

One phase of this general movement is illustrated, and advocated, in Bolton Hall's "Three Acres and Liberty," just published. It is a study in intensive cultivation, as practical, we imagine, as any popular book can be, and, though based on a certain amount of enthusiastic faith, apparently free from the exaggerations of the ordinary gardening treatise which shows you how to send four sons and daughters to college on the proceeds of a half-acre cabbage patch. He does not promise fortunes other than those that abide in the possession of health, laborious effort, and a safe livelihood. He does not even want to take his urban dwellers too far back into nature, but is content to place them in the vicinity of the great cities:

> It is not the growth of the cities that we want to check, but the needless want and misery in the cities, and this can be done by restoring the natural conditions of living, and among other things, by showing that it is easier to live in comfort on the outskirts of the city as producers, than in the slums as paupers.

No objection need be urged against Mr. Hall's main thesis. Indubitably, vacant-lot farming is better than the slum, and a small poultry farm in New Jersey must be better still. As a method of relief, the system may be commended. But there is room for protest against that one-sided view of things which speaks of "restoring the natural conditions of l'ving" by sending people back to the land. This is antiquated Rousseauism. The city is as natural a place of habitation as a farm on Long Island or a cabin in the Adirondacks. Dirt, disease, wickedness are unnatural, if we wish to be optimistic; but an apartment house, or a tenement house even, if it be kept clean and its owner be made to obey the regulations of the Tenement House Commission, is a natural abode. So much ought to be taken for granted as a basis for really successful social service work, which must aim at changing slum dwellers not so often into farmers as into urban citizens dwelling amidst tolerable conditions. It is even possible to maintain that, while by emptying the slums into the country we may benefit the towns, we are scarcely doing well by the country itself, whose welfare, it should be remembered, is one of the prime considerations in the Back to the Land movement. Not content with draining the country of its best blood, the city would turn the country into a dumping place for its human waste.

Take the small farmer on his three acres, and his brother of Manhattan on his 1-154 of an acre, or even his 1-1000 of an acre, if he lives on the East Side. The apparent difference does not really prove that one is more "congested" than the other. After all, every inhabitant of New York who for his breakfast eats a roll, an egg, a plate of oatmeal, or a chop, or drinks a cup of coffee or tea, exploits an acre or more in Kansas, another acre in Texas, together with smaller areas in New Jersey, Brazil, Cuba, and China. And when it comes to actual dwelling space, we venture to say that a four-room flat contains as much superficial area as the ordinary farmer's house—certainly in winter, when he locks all the rooms and lives in the kitchen.

What makes the movement Back to Nature all the more difficult is the fact that our tenements are for the most part filled with people who have just come from Nature, and cannot be persuaded to go back, because they "have been there." Who create our slums by cramming the city with more raw human material than it can digest? Italians from the open fields of Calabria and Sicily, Jews from the town and villages of the Russian Pale (comparatively crowded, it must be confessed), Magyars from the great plains of Hungary, Irish and Scandinavians, both used to the open air. Their change of residence is voluntary. They are here because they are wanted—in the city.

To quite another class Nature, we admit, appeals strongly—to the mentally tired. They, however, do not as a rule live in the slums. They are tired, in fact, from making more or less money, and the country to them suggests rest. It does not really impugn the sincerity of their emotions that they do their longing for a bit of black soil of their own, as the phrase goes, beside a steam radiator and with an electric push-button at their elbow. Visions will come then of green spaces, where the asphalt ceases from melting, and the subway guard is at rest; of cool, moist earth-clods, where repose the luscious red or green of tomatoes and cucumbers that need no Pure Food law, but are an end in themselves; of delightful delving with the hoe and the spade in early morning hours. *Absint* rheumatism and malaria. And that is really why we do not care for Mr. Chamberlain's Three Acres and a Cow so much as for Mr. Hall's Three Acres and—Liberty.

THE TYRANNY OF THE TENOR.

When the present opera season began in New York everybody expected a terrific war of tenors, which would make a chapter in the history of music in America. But the conflict did not come off. At Hammerstein's Manhattan Opera House Bonci, with all his fine art, did not succeed in arousing public enthusiasm to fever heat; his voice was found to lack that luscious beauty, resonance, rotundity, and inexhaustible plenitude of power which had made Caruso famous at the Metropolitan. It was a woman who came to the rescue of Oscar Hammerstein. Melba led his forces valiantly against the Conried army, and the result has been a drawn battle.

Inasmuch as it was the soprano, not the tenor, who saved Hammerstein, it is not strange that he should have shown an inclination, a few weeks ago, not to reëngage Bonci. Then the question suddenly assumed a humorous aspect. Conried sent out his emissaries to kidnap Bonci. Hammerstein's fighting blood was up at once, and he announced that the Italian was under contract with him for another season. The matter will probably be settled in the courts. It is not clear why Conried should be so eager to have Bonci; if that tenor's voice seems lacking in sonority, even in the smaller and acoustically admirable Manhattan, what will become of it in the mammoth Metropolitan, which has been the grave of so many foreign reputations? It is surmised that he was to be utilized chiefly in the older Italian works, known as prima-donna operas.

The difference between the status of Bonci and that of Caruso is not merely a topic for gossip; it affords insight into the present state of musical culture and the attitude of the public. It is admitted that Bonci is an admirable artist, and that he falls short of Caruso in little but the quality and volume of voice. Must we infer that this difference is really vital, or is the public to blame? No doubt, a full and luscious voice is in itself a thing of beauty and a joy—for some time; but, on the other hand, the public does worship Caruso unduly. He has become a fad, and is overrated. Jean de Reszke also was a fad, but he was not overrated. He could sing Italian rôles almost as enchantingly as Caruso sings them; he could sing—and act—French rôles infinitely better; and he was the greatest interpreter of the Wagner rôles, in which Caruso would appear to about as much advantage as Bars did the other day as his substitute in "I Pagliacci." Caruso's art,

in a word, is lamentably limited; he is even afraid to sing some of the important Italian rôles—Manrico, for instance. Moreover, his voice is not so infallibly beautiful as it was a year or two ago. He is becoming more and more addicted to singing very loudly on the slightest provocation, which is a sure sign of decline; for it is as much easier to sing loudly than softly as it is easier to remain within Caruso's contracted sphere than to display the versatility of a Jean de Reszke.

The loss of such a voice as Caruso's would, no doubt, be a calamity, from one point of view. On the other hand, it cannot be denied that the Caruso idolatry is a menace to the cause of good music in this town. Some of the operas favored by him are, no doubt, masterworks, but more of them are not; they are feeble, tawdry things, which crowd out other and better works. Carusoism —if we may coin the word—means a distinct decline in the musical standards of the community. "Does he sing?" is the one question now asked at the box-office; what he sings is a matter of supreme indifference to most. It is a situation in which the tenor is not only king, but tyrant, despotically limiting the repertory to those operas in which he can most effectively show off his personal accomplishments.

Hans von Bülow once said that "a tenor is not a person; he is a disease." Excessive worship of tenors is a disease, too—a popular epidemic resulting in a temporary vitiation of taste, a shifting of the general interest from works of genius to the mere interpreter of anything that pleases. This tenorolatry is not a new thing. Wagner gave a sarcastic account of the attitude of Paris audiences which sat through performances of an opera that did not interest them for the sake of hearing the Caruso of that period fling out his loud top-notes.

There have been popular crazes over sopranos, too, but they have seldom reached the frenzied pitch of tenor-worship. This may be due to the fact that great tenors are much scarcer than great sopranos. One might also attribute the greater ardor of the worship of the Jean de Reszkes, the Carusos, the Alvarys, to the fact that most of the idolaters are women. But here a curious question presents itself: why is it usually the tenor, hardly ever the baritone or the bass, who is worshipped? One would expect women to be most deeply impressed by the manliest voice, and a bass or baritone is more manly than the lyric tenor voice which approximates the feminine alto. To be sure, nothing could be more virile than a robust, dramatic tenor like De Reszke, Tamagno, or Niemann. Probably the composers are largely responsible for the tenor-worship. In Verdi's operas, with hardly an exception, the tenor plays a more important part than the baritone or bass, and the same is true of other opera writers, Mozart's "Don Giovanni" being a notable exception. Wagner wrote one opera, "The Flying Dutchman," in which the baritone is king, whereas in six of his works the supremacy of the tenor is indicated by the very titles—"Rienzi," "Tannhäuser," "Lohengrin," Tristan and Isolde," "Siegfried," "Parsifal." This being so, we shall probably continue to be subject to the tyranny of one tenor or another, unless it be true, as was maintained at a recent conclave of French savants, that the tenor voice is a relic of barbarism, destined to become extinct.

THOMAS BAILEY ALDRICH.

Thomas Bailey Aldrich died Tuesday at his house in Boston. He had been ill for some time and had undergone a serious surgical operation.

To those who knew him, the dispatches announcing the death of Mr. Aldrich will carry a poignancy that seldom attends the passing of men who have lived out their threescore years and ten. He was a lover of life. Like all poets of the Horatian kind, he knew the melancholy thought of dissolution, the end of pleasantness, but, even after the great sorrow of his last years, the *meditatio mortis* was alien from him. Lowell himself was not more remarkable for perennial youthfulness, and far more than Lowell, Aldrich *looked* astonishingly young—"a habit," as he used to say, "acquired in youth." Blonde, erect, and ruddy, with a peculiar debonair alertness of hearing, he seemed at seventy to defy mortality, to be himself as immortal as a lyric.

Thomas Bailey Aldrich was born November 11, 1836, at Portsmouth, N. H., the "Rivermouth" of his books. He came of a sound shipowning stock, that with the decay of the India trade had withdrawn to other interests, yet the "seaward-leading alleys" of the old town, the "hints and flavors of the sea" that lurked in its elm-shaded streets, were among the most vital of his lifelong memories. In his last years, on the commodious quarter-deck of the "Bethulia" he liked to recall early adventures in punt or dory. When he was but a child he was taken to New Orleans, where, we are told, his father invested his property in a banking business so securely that he could never afterwards get more than a part of it out. In that half-tropical city he spent a decade of his childhood, drawing, we may believe, from its exotic sounds and sights imaginative clues to a richer and more romantic life than was to be observed among the earnest dwellers upon the North Shore, with their preoccupations, commercial and transcendental. When the time came for him to prepare for college, he was sent north to his grandparents in Portsmouth, there to enact those engaging scenes in the life of a bad boy—"but not a very bad boy"—which he has chronicled in one of the best books of its sort in the world. In 1852, as he was on the eve of entering Harvard, his father died in New Orleans, and "Tom Bailey," instead of taking his way to Cambridge, to study belles-lettres with Professor Longfellow, was enthroned upon a stool in the counting-room of his uncle, Charles Frost, in New York.

Of this experience we can discover but two direct results—a singularly open and beautiful penmanship, and a shrewdness and capacity in business matters peculiar among poets; but the indirect results of his years of residence in New York were momentous. Before leaving Portsmouth he had found a place in the poet's corner of the local newspaper for an occasional paper of verses, and from the time of his arrival in New York he seems to have heard the authentic vocation. He became the intimate of the ambitious young poets and jaunty wits of the Metropolitan group, Taylor, Stoddard, Arnold, Stedman, and the rest, and had a taste of the fairly adequate Bohemia that in the fifties centred about "Pfaff's" and "Nihlo's." He became a constant contributor of verse to the best journals and magazines of the day, and with the pathetic "Ballad of Baby Bell," and "Little Mabel, with her face against the pane" — afterwards anathema to him—won almost at once a conspicuous popular success. In 1855 he became a staff writer for the New York *Evening Mirror*; from 1856 to 1859 he was assistant editor of the *Home Journal*, then conducted by N. P. Willis; and in the early years of the civil war he was a newspaper correspondent attached to Blenker's division of the Army of the Potomac. Throughout this period his art was constantly ripening and refining. He published several volumes of verse showing both a growth in imaginative energy, and an admirably fastidious self-criticism in the rejection of many of his popular successes. By 1865 he had definitely "arrived." In that year he married, moved to Boston, and entered the employ of Ticknor & Fields, then at the height of their prestige, as editor of *Every Saturday*. In the same year his collected poetical writings were published in the famous blue and gold edition, which was then the hall mark of both merit and popularity.

The years that Mr. Aldrich spent with this prosperous and benign publishing house coincided with his prime of life and with his most productive creative period. To the decade following 1865 belong some of the finest of his poems, as well as "The Story of a Bad Boy" and "Marjorie Daw," which are likely to stand as the best of his prose. These years, too, were perhaps the happiest of a life rich in personal friendships. Mr. Howells, then assistant editor of the *Atlantic*, became his special friend and literary confidant, and with Edwin Booth there grew apace an affectionate attachment that was only terminated by the great actor's death. The older men, like Longfellow and Lowell, found young Aldrich, with his talent, personal distinction, and ready wit, the pleasantest of companions. It was in the dining room of Aldrich's little house on Pinckney Street that Longfellow conceived "The Hanging of the Crane," and when Lowell sailed in 1872 for two years in Europe, Aldrich, with his young wife and much-admired twins, occupied Elmwood, where, as he once told the writer with conviction, he saw ghosts. To-

wards the end of this period his native instinct for success, aided and reinforced by the wise kindliness of an influential friend, *deus columenque rerum*, established him in the road to a material prosperity that has been rare among poets, and shaped his life to an Horatian amenity. In 1875, following the discontinuance of *Every Saturday*, Mr. Aldrich began that series of world-wanderings that were among the most characteristic pursuits of his later years; and in 1881 he succeeded Mr. Howells in "the seat of the scornful," the editorial chair of the *Atlantic Monthly*.

In a little back office, overlooking the Old Granary Burying Ground, where, as he liked to say, lay those who would never submit any more manuscript, Mr. Aldrich spent nine years, solaced and supported by a pipe, an engine not hitherto in favor in that office, and by the constant attendance of his setter "Trip." Under his conduct the *Atlantic* attained a notable unity of flavor and distinction of style. A little less accessible to new and unknown talent than Mr. Howells had been, he was yet quick to perceive the note of distinction, and few of his swans turned out geese. He was not a militant editor, and was not greatly concerned about politics and affairs. His interest was first and always Literature, and perhaps no editor of the *Atlantic* has printed more of it. During his tenure of office the afterglow of the great day of New England literature was fading, but fading slowly. He could count on an occasional poem from Longfellow, Holmes, and Lowell, and many from the younger group headed by Sill. He had Parkman and Fiske for historical papers, James and the two Hardys, American and English, for fiction. He developed the critical department of the magazine to a high degree of competence by marshalling what has seldom been seen in this country, a thoroughly compact and capable coterie of critical reviewers. This group, which was composed of Richard Grant White, G. E. Woodberry, George Parsons Lathrop, Horace Scudder, and Miss Harriet Waters Preston, contributed a surprisingly large proportion of the material that is embodied in the score of volumes of his editing. Read to-day, after the lapse of twenty years, it is still remarkable for penetration of insight and felicity of expression. It was under Aldrich, too, that the *Atlantic* won its international reputation as being, in the phrase of an English review, "the best edited magazine in the English language." To his fastidious sense of phrase and syntax, reading proof was a sacrament. The last scrutiny was a function that he never delegated, and it fared ill with any split infinitive or suspended nominative—even with such seemingly innocent locutions as "several people"—that fell under his searching eye.

In 1890 Mr. Aldrich resigned the editorship of the *Atlantic* to Mr. Scudder. Thenceforth he gave himself over largely to travel and to the delights of connoisseurship and friendly intercourse. It has been customary to lament the paucity of his production in verse in these later years, but few are the poets who have added to their reputation by anything written after their sixtieth birthday, and the man who had written,

> To spring belongs the violet, and the blown
> Spice of the roses let the summer own.
> Grant me this favor, Muse—all else withhold—
> That I may not write verse when I am old,

was too clear-sighted a critic to have any illusions as to the possibility of poetry by technique alone. Yet to his last period belongs some admirable work. His blank verse drama, "Judith of Bethulia," is as notable for the strength of its situations, for the genuine dramatic unction of its conception, as it is for the suave melody of its verse; and in prose the pregnant note-book jottings, the delicate, suggestive sketches in his "Ponkapog Papers," the keen comic instinct of "A Sea Turn," show little abatement of his exquisite faculty. In 1904 the first great sorrow of his fortunate life came to him in the death of one of his sons. How great the loss was only his intimates knew. By it, he said, his literary faculty was withered as by a touch of evil magic. He recovered it sufficiently to write a fine melodious elegy for the centenary of the birth of Longfellow, but his work was done.

No less eminent a judge and practitioner of humor than Mark Twain has lately written: "Aldrich has never had his peer for prompt and pithy and witty and humorous sayings. None has equalled him, certainly none has surpassed him, in the felicity of phrasing with which he clothed these children of his fancy. Aldrich was always brilliant, he couldn't help it; he is a fire-opal set round with rose diamonds; when he is not speaking, you know that his dainty fancies are twinkling and glimmering around in him; when he speaks, the diamonds flash."

Though there may be in the superlatives of this a little—a very little—friendly exaggeration, all who knew him can bear witness to its essential truth. It is difficult, however, to do adequate justice to the quality of Aldrich's wit by reporting his tersely turned witticisms. When the *North American Review* suddenly reduced its thickness by one-half, he said, "It looks as if destiny had sat on it"; but to savor the full zest of the whimsicality we should have had to see the fine air, the charming half-proud, half-deprecatory toss of the head with which it was carried off. A great source of his wit lay in the humorous prejudices of which he had a vast supply. Could he find a dignified and pretentious person holding fast some of the ideas he himself specially disliked, he was at his best. He would literally—as Leigh Hunt said Lamb would have done to Johnson—"pelt him with pearls." One of the most engaging qualities of his humor was a certain happy impudence. He delighted to tell of his experience in getting his name reinstated in the voting list of Boston after an absence of a year or two from his Mount Vernon Street home: appearing before a minor magistrate of the race that, as Lowell said, "fought all our battles and got up all our draft riots," he was asked his name and occupation, and if he could read. Modestly admitting that he could "a little," he was given the Declaration of Independence and told to "Read thot." "Begorra!" said Mr. Aldrich, "I will. 'Whin in the coorse of human ivints——" He was incontinently allowed to register. Anecdotes of this sort are legion. We shall not soon listen to his like again.

This is not the place for an elaborate appreciation of Aldrich's poetry, or a judicial consideration of his place in American literature. Yet one cannot write of him without speaking, however inadequately, of his fine achievement. More than any other of our American poets, perhaps, he was master of poetic style. None has ever had so exquisite a sense of poetic propriety, or displayed such unremitting care for the counsels of perfection, such unflagging adroitness with the file. No poet of the century has a better right to answer Leopardi's denunciatory question,

> Musa, la lima ov'è?

Yet the perfect finish of his work, its delicacy, which, as Hawthorne wrote, one hardly dared breathe upon, have, perhaps, been too much emphasized in defining his poetic achievement. One has only to take up the volume of "Songs and Sonnets," which represents his own last selection and arrangement of his work, to find qualities of romance, of imaginative strength, of wistful humanity that blend in an impression of uncommon range and vitality. Take such pieces as "On an Intaglio Head of Minerva," "The Rose," "Palabras Cariñosas," with their exquisite half-playful sentiment, their last felicity of expression; take the noble elegiac strain of "Sargent's Portrait of Edwin Booth at the Players," and "Tennyson"; take such haunting and poignant bits of *frisson* as "Identity" and "The One White Rose"; take the perfect sonnet "Sleep," and "Fredericksburg," with its quiet beautiful beginning, its tragic and tremendous climax, and you have a group of poems, representative rather than exceptional, that is as likely to last as anything that American literature has to show. Turn from them to anything save the very best of Longfellow's, or Lowell's, to Whitman's Titanic mouthings, to the average characteristic piece of Emerson or Poe: you find, perhaps, an ampler air, a deeper note, but you find also passages of surplusage and moments of languor. None of our poets has his precious cargo so neatly stowed for the voyage down the years as Aldrich. And despite the polish which so often makes for impersonality none is more likely to create an abiding impression of individuality. Abstractions and other men's ideas had little interest for him. He never expressed anything but himself, and he knew well when to have a bit of the rough block on the polished surface, when to break the smooth lapse of his verse with the frank and unpremeditated line. It is hard to think of any name in our annals that at once suggests a quality of poetic pleasure so fine, so constant, and so individual as the name of "Aldrich."

FERRIS GREENSLET

NEWS FOR BIBLIOPHILES.

Four such rare and interesting pieces of Americana were perhaps never described on a single leaf of an auctioneer's catalogue as the four little books sold as "the property of a Gentleman," by Sotheby, Wilkinson & Hodge, London, on March 16. Thomas Churchyard's "Prayse and Reporte of Maister Martyne Forboishers Voyage to Meta Incognita—in which Praise and Reporte is written divers discourses never published by any man as yet," London "the

tenth of Mayo, 1578," brought £1,000. The British Museum possesses two copies, but no other seems to be traceable. This is the first printed account of Frobisher's first voyage, which lasted from June 15, 1576, into October of the same year. A second voyage, from May 31, 1577, to September, was first chronicled in print by Dionyse Settle, "one of the Companie," under the title "A True Reporte of the Laste Voyage into the West and Northwest Regions," London, 1577. The volume, which brought £760, was the earlier of the two editions with the same title-page. A second copy, also the first edition, is in the Grenville collection in the British Museum, and a copy (edition not indicated in the catalogue) is in the John Carter Brown Library in Providence. No other seems to be known. Frobisher set out on a third voyage on May 31, 1578, returning about October 1, this time bringing 1,300 tons of his "ore"—worthless Greenland pyrites. The account of this expedition, written by Thomas Ellis, under the title, "A True Report of the Third and Last Voyage into Meta Incognita," London, 1578, brought £920. No second copy seems to be traceable. Each of these three little books had on the title-page the autograph of Humphrey Dyson, a book collector and student of the time of Elizabeth. They were evidently bound together by him, and have recently been broken apart and separately bound in calf by Riviere.

The fourth lot, perhaps the rarest and most valuable of all, is the original small 12mo. edition of "The True Declaration of the Troublesome Voyadge of M. Sir John Haukins to the Parties of Guynea and the West Indies, in the Years of Our Lord 1567 and 1568," London, 1569. This was Sir John Hawkins's third slave-trading voyage. With him, commanding one of his ships, was Francis Drake, then a young man of twenty-seven. The story of Spanish treachery in the harbor of Vera Cruz, the destruction of all but two of Hawkins's ships, and Drake's immortal vow are well known. Hawkins's own account has long been familiar from the pages of Hakluyt. This first edition is recorded by Sabin, with this comment: "Title and note from Lowndes's 'Manual.' We have never seen the book, and incline to the belief that this octavo edition does not exist, but that it is only to be found in Hakluyt's Collection." Here, after many years, it turns up almost unheralded in the auction room and brings £630. At the same sale the "Relation of Maryland," 1635, with the folding map, brought £400; and the autograph manuscript of Burns's "Scots wha hae wi' Wallace bled," £355. Prices on other interesting lots, first editions of Shelleys, Lamb, etc., will be received in due season by mail.

The auction of the second part of the library of the late Dr. Ottocar E. Kopetschny, an Austrian refugee who resided for upwards of fifty years in Jersey City, and who brought together a vast accumulation of books in many classes of literature, will occupy the Merwin-Clayton Sales Co. of this city, March 25-28. There are a number of old English plays and some unusual books, with colored plates, such as Holbrook's "Ichthyology of South Carolina," Hooker's "Rhododendrons of Sikkim-Himalaya," and Westwood's "Insects of India." On Monday, April 1, Dr. Kopetschny's autograph collection, with some manuscripts from other sources, will be offered.

On March 26, C. F. Libbie & Co. of Boston sell three law libraries, one of them being that of the late Senator George F. Hoar. There are a few books which will interest the collector of Americana. The most important is a volume of Rhode Island Laws, including the Charter, printed at Newport, 1730, by James Franklin, a brother of Benjamin Franklin. The only other copy recorded at auction is Brinley's, which brought $130 in 1879. On March 27 and 28 Libbie offers a miscellaneous collection, including the library of the late Hon. Samuel Warner. There are three pieces of Americana: Acosta's "Historia Natural y Moral de las Indias," first edition, 1590; Acugna's "Voyages and Discoveries in South America," 1698; and Foster's "Relation of the Rebellion Acted in the Island Barbadas in the West Indies," 1650.

Correspondence.

THE FUTURE UNIVERSITY LIBRARY.

To the Editor of The Nation:

Sir: Whether the present method of library administration has not reached the limits of its efficiency, and if so, whether a new ideal for the future university library ought not to be adopted, are questions of pressing interest. Some light ought to be thrown upon their solution by the specialized libraries which have proved most successful. Reference may perhaps be pardoned to the Harvard Law School Library as the one most familiar to us. The development of this library has taken place under an expert who has given exclusive attention to legal literature. The result has been the creation of one of the best law libraries on this continent; and this library in turn has helped create one of the best law schools in the world. Mere increase in the number of books and in extent of accommodation could never have yielded these fruitful results if there had not been in addition expert and departmental administration. If only through such departmental development a thoroughly efficient library in a law school has been built up, a similar policy must, so far as practicable, be pursued in history, science, philosophy, or any of the other great departments of a university. The distinction of schools and departments does not affect the essential principles of administration. Moreover, the present temporary expedients for departmental college libraries enforce the desirability of permanent departmental administration. The library of a department has been truly described as its "laboratory." But a successful laboratory can be conducted only by those who give their lives to the task, and never by mere general supervision.

If we grant that the department libraries are founded on correct principles, we must form a new conception of the nature and functions of a central library in a university. Such a central library would comprise the general collection of books which are of equal value to the whole university, those special collections which could not be rightly placed in any large department, the so-called "live-books" or those in current use, the accumulated treasures other than departmental often designated as "dead-books," and the great array of general periodicals, reports, records, and documents serviceable to the entire community. It would also contain the general reading rooms, and provide for the various divisions of general library administration. Indeed, this administrative work would be one of the most important functions of the main library. The discovery and application of the best methods of delivery, cataloguing, shelving, ordering, and organization are tasks of sufficient magnitude to demand the concentrated attention of specialists. Not only does a central library which includes within its scope the peculiar functions of the department libraries retard their progress, but it must at the same time impair the efficiency required for duties within its proper domain. The attention divided between special libraries is necessarily diverted from the general collections.

Provided the view here presented of the different spheres of a central library and of departmental libraries be correct, we see that by a strange confusion of thought arguments which properly belong to the matter of location have been made to settle the method of administration. Because convenience may demand a centralized plant, it cannot be inferred that the administration of department libraries ought therefore to be merged in the central library. On the contrary, a division of administrative functions is entirely compatible with a centralized location. A suitable plan for a general university library might, for instance, be found in a main building for the central library surrounded by a group of department buildings in close connection; or it might prove more advisable to have the department libraries under the same roof as the central library. This latter plan would afford the readiest access to all the department libraries. Yet whatever the location, the one thing necessary is the maintenance of separate department libraries.

To-day the great university libraries have, for the most part, only a corps of administrative officers. The future university library must provide in addition a staff of departmental librarians. This is equally true of our great public libraries. In the proper readjustment and reorganization, therefore, of the central library and of the department libraries by the adoption of the departmental system, will be found, it is believed, the ideal of the future university library.

Benjamin Rand.

Emerson Hall, Cambridge, Mass., March 15.

ONE CAUSE OF POVERTY IN PROSPERITY.

To the Editor of The Nation:

Sir: In the midst of unprecedented prosperity and in spite of heavy increase in production of gold, money is not only at high rates, but scarce, and we are therefore uncommonly well off, but so poor in ready cash that some business depression is inevitable. An important factor in producing this condition is that so much money is pocketed rather than banked. Although the banking habit is extensive and increasing

every year, yet most of us have more money in our pockets in flush times than in bad times. When it is considered that one dollar more put in the pocket of each inhabitant means $85,000,000 less in the banks, it is evident that this is a powerful factor in producing a scarcity of loanable funds.

ROBERT S. MINOT.

Boston, Mass., March 9.

Notes.

Charles Scribner's Sons will soon have ready the following: "Military Memoirs," by Gen. E. P. Alexander; "The History of Mediæval and of Modern Civilization to the End of the Seventeenth Century," by Prof. Charles Seignobos; "The British City: The Beginning of Democracy," by Frederic C. Howe, and "Abelard and Héloïse," by Ridgeley Torrence.

In recognition of the revived interest in St. Francis of Assisi, Tennant & Ward are about to bring out "A Short Introduction to Franciscan Literature," by Fr. Paschal Robinson, O. F. M.

There is to be a new bimonthly *Review for Internationalism*, published in German, English, French, and Dutch editions, issued by the Preliminary Office of the Foundation of Internationalism at the Hague. The first number, which will appear in about a month, will contain articles by Dr. Hermann Beck, Berlin, director of the Internationales Institut für Sozialbibliographie; Björnsterne Björnson, Aulestadt, member of the Nobel committee; Francis Fox, London; Alfred H. Fried, Vienna, member of the Internationales Friedensinstitut; James S. Gibson, London, vice-president of the Council of the Royal Institute of British Architects; Dr. jur. J. van Schevichaven, Amsterdam; J. W. Simpson, London, fellow of the R. I. B. A., member of the Comité Permanent des Congrès Internationaux des Architects; William T. Stead, London, editor of the *Review of Reviews*; Nico van Suchtelen, Blaricum, and Henry M. Wolff, London.

Dr. Rolfe's "Satchel Guide for the Vacation Tourist in Europe" comes from Houghton, Mifflin & Co., with its annual corrections for 1907. Dr. Rolfe points out, with some justification of pride, that even the maps are regularly revised in this excellent manual.

Volume xiv. of "The Mineral Industry" gives a full report of statistics, technology, and trade during 1905. It is edited by Walter Renton Ingalls, editor of the *Engineering and Mining Journal*, which publishes it.

The Oxford University Press issues two little grammars of North-east Rhodesian dialects—one of the Wisa language, by A. C. Madan; the other of Bemba, by the Rev. Father Schoeffer.

Henry Frowde has issued a handy little volume called "Oxford and the Rhodes Scholarship," which gives such information as may be required by those who contemplate trying for one of these scholarships, or who have already obtained one. It is compiled by R. F. Scholz and S. K. Hornbeck.

The "Register of the Members of St. Mary Magdalen College, Oxford," is not a book to which one would naturally turn for gayety, but there is a spark of amusement here and there in the fifth volume of the New Series just edited by Dr. William Dunn Macray. The list is here brought down almost within the memory of those still living, and includes a sketch of Dr. Martin Joseph Routh, with a capital portrait of him in his ninety-sixth year. Among the interesting relics and anecdotes of this stalwart scholar of the old school, there are given a few lines of English verse found in his manuscript papers and evidently sent with the gift of a pen to his future wife:

Employ this Pen; and every thought will shine
Bright as thy charms, through each successive line.
Employ this Pen, 'twill each rare gift unfold
Thy mind possesses, far surpassing gold.
Employ this Pen; thy unaffected ease,
And sweet good nature, in each phrase, will please.
Employ this Pen; for, know, an Angel's quill
An Angel's virtues must express with skill,
Must set thy high, yet mild, perfections forth,
And give the Paper more than India's worth!

"Amerigo Vespucci" is the latest volume by Frederick A. Ober in his Heroes of American History (Harper & Bros.). From the well-known sources he has made a readable story of Vespucci's life and explorations. Mr. Ober's familiarity with all parts of the West Indies and with the coasts of North and South America are, of course, a great help to him in his work in this series.

A handy little volume which is not likely to make too severe a demand, on the reader is O. M. Edwards's "Short History of Wales" (London: T. Fisher Unwin). The author, who is well known as a teacher and writer, not long since contributed the "Story of Wales" to the Nations Series. In this more popular work he does not attempt to give an exhaustive account of the fortunes of the Welsh people. All that his space allows is a brief sketch of the different historical periods, and of some of the aspects of the national development. Under this head come the chapters on the "Rise of the Peasant," "Howel Harris and the Awakening," "The Formation of the Education System," etc. The pages on Wales at the present time are unquestionably the most interesting. The style is simple, lucid, and picturesque. Those for whom the book is primarily intended—readers ignorant of Welsh and Latin—will be led to knowledge by pleasant paths.

An edition of "The Pearl," that Middle English poem on which Israel Gollancz, Dr. S. Weir Mitchell, and other translators have lately tried their hands, appears in D. C. Heath & Co.'s Belles-Lettres Series. The editor, who supplies an elaborate critical apparatus in the form of introduction, notes, bibliography, and glossary, is Dr. Charles D. Osgood, jr., preceptor in English at Princeton. The discussion of the sources whence the unknown writer of "The Pearl" drew his inspiration for both matter and form is very detailed. Prof. W. H. Schofield has maintained that the poem is not autobiographical, but allegorical. Against this view Dr. Osgood presents some ingenious arguments. When all is said and done, however, the evidence is so scanty and ambiguous that no definite conclusion is possible; and the reader who does not care for those empty feats in wiredrawing which delight the modern philologist, is compelled to the conviction that both Professor Schofield and Dr. Osgood have wasted far more powder than the bird is worth. Dr. Osgood examines the two theories of authorship, and decides that neither "Huchown of the Awle Ryale" nor Ralph Strode is the man.

The first of the lectures founded at Cambridge in memory of the late Sir Leslie Stephen was delivered on February 22, by Walter Raleigh, professor of English literature in the University of Oxford. After giving a sympathetic appreciation of the work and influence of the distinguished critic, the lecturer went on to speak of Samuel Johnson, a choice which he liked to think Stephen himself would have approved. While he talked with affection of Boswell's "Life," he reminded his hearers that the Johnson who appeared in its pages was in easy circumstances; he had conquered his world, and his right to dictate was acknowledged by all. To know him on every side they must supplement it by a study of Johnson's own works, written, for the most part, in his days of poverty and stress. Full as these were of splendid utterances, they had been overshadowed by the immortal biography. The lecture has been published by Henry Frowde.

"The Fundamental Principle of Fichte's Philosophy," by Ellen Bliss Talbot (The Macmillan Co.), is one of the monographs issued by the philosophical department of Cornell University. It contains a critical interpretation of Fichte's teaching concerning the Ego, Being, and Existence. Incidentally Dr. Talbot sets forth with ingenuity and clearness the relation of Fichte to Kant, the nature of "intellectual perception" in both the Critical and the Absolute philosophy, and adds an important appendix to show that Kant's "I Think" (*synthetic unity of apperception*) is a purely formal principle. Successful opposition is offered to Thiele's contention that there were three distinct phases in Fichte's thought. Indeed, it may be easily proved that none of the supposed changes in his philosophy at different periods was essential. The differences were simply incident to a full explication of his principles, sometimes in the face of hostile criticism. Dr. Talbot's essay, while primarily intended for advanced students, forms a good introduction to Fichte's philosophy. She expresses herself with simplicity and great clearness; her temper is judicial; and in her interpretation she is faithful to the philosopher's writings undistorted by her own preconceptions, or by deductions as to what he "ought to have thought."

Under the title of "Christian Theology in Outline," Prof. William Adams Brown of the Union Theological Seminary of this city, publishes a text book of doctrinal theology which will further advance his reputation as a mediating theologian, who is in sympathy with modern views, yet sincerely anxious to do full justice to the tenets of the fathers (Charles Scribner's Sons). He has written primarily for those who feel themselves attached to the historic forms of faith, and who desire to be orthodox, but who have difficulty in maintaining Christian belief in the face of modern knowledge. He has succeeded in stating several of the doctrines of historic Chris-

tianity, notably that of the Trinity, in a manner to relieve dogma of some of its difficulties, while retaining largely the classic form of expression. Professor Brown is a careful scholar, who has trained himself to avoid exaggeration, and whose chapters never offer rhetoric in the place of thought. In justification of his method in presenting an outline of divinity he cites most appropriately the "Briefe Premonition" of William Ames's "Marrow of Sacred Divinity," from which we quote:

Some, and those indeed not unlearned, dislike this whole manner of writing, that the sum of Divinity should be brought into a short compend. They desire great Volumes, wherein they may loosely either dweli, or wander. Whom I desire to consider, that all have not so great leasure, or so vast a wit, as to hunt the Partrich in the Mountaines, and Woods: but that the condition of many doth rather require, that the nest itselfe, or the seat of the matter which they pursue, bee shewed without any more adoe.

Justification of the new theology and defence of critical principles and results as not hostile to devout life is the burden of the Rev. Richard W. Seaver's Donellan Lectures before the University of Dublin, entitled "To Christ Through Criticism" (Imported by Charles Scribner's Sons). The credibility of the gospel miracles, especially of the resurrection, is the subject treated most at length. The lecturer contends that the moral and religious character of the personality described in the evangelic record removes the events in question from the plane on which they are commonly considered by those who dispute their reality.

The Aramaic Papyri discovered in 1904 at Assuan, on the borders of Upper Egypt, are now published in twenty-seven folio facsimile tables, with Aramaic text as read by the editors, translation and commentary, together with introductions by Prof. A. H. Sayce and A. E. Cowley, an explanation of Egyptian proper names by W. Spiegelberg, and a bibliography of former Egyptian Aramaic papyri by Seymour de Ricci (London: A. Morning). The Assuan papyri consist of ten related documents which contain the complete register of a Jewish family in ancient Syene (Assuan) for two generations, with full information of their business and property affairs, especially settlements at marriage and agreements as to inheritances. They are dated accurately according to the reigns of the Persian kings Xerxes, Artaxerxes, and Darius, and extend over a period of sixty years, from 471 to 411 B. C. Since each date is recorded in both Egyptian and Jewish chronology, valuable information is at hand as to the history of the calendar. These documents are important also for the history of religion, for the frequent presence of the divine name Jahu in proper names indicates that that word was still spoken. Mention of an altar of Jahu before which an oath was taken proves that the Deuteronomic law of a single sanctuary was not then in force among Jews of the Diaspora; and mention of an oath by a Jewess called Mibtachja before the Egyptian god Satl shows that other gods besides Jahweh were recognized, as was also the case in ancient Israel. This same Mibtachja is mentioned in a later document as having for her second husband a certain Nathan, whose name formerly was As-Hor. Sluce the latter name is as certainly Egyptian as the former is Jewish, the conclusion may be drawn that Mibtachja was sufficiently zealous to make her husband a proselyte. These papyri offer many topics for discussion, and are likely to find frequent mention in future monographs on Jewish history.

The interest excited by the Memoirs of Prince Chlodwig zu Hohenlohe-Schillingsfürst has thrown into the background those of the general of artillery Prince Kraft zu Hohenlohe-Ingelfingen, who belonged to an older branch of the same family. The fourth and final volume of his reminiscences has just been published ("Aus Meinem Leben," Aufzeichnungen des Prinzen Kraft zu Hohenlohe-Ingelfingen, weiland Generals der Artillerie. Berlin: Mittler & Sohn). The work is valuable as a contribution to the history of Germany in the latter half of the nineteenth century, and especially as a record of events leading to the establishment of the German empire. He makes fun of Bismarck's lofty conception of his own ability as a strategist, but deems this an incidental and perhaps natural weakness of the remarkable man, and places it on a par with Frederick the Great's pride in his poems and Goethe's notion of his superior artistic talent in drawing and painting.

The "Studienreisen" of Dr. Theodor Koch, recently published by Wasmuth in Berlin, embodies the results of his personal observations of the American Indians during travels in the Western continent extending over three years. He expresses his surprise at their sense of beauty and their skill in drawing a landscape when he gave them a pencil and paper. He confirms the views of the distinguished ethnographer, Prof. Richard Andree, of Munich, in his studies of *Naturvölker*.

Edmond Lepelletier is about to publish his "Paul Verlaine: sa Vie, son Œuvre." He was an intimate friend of Verlaine, and to him the poet left his papers for use in writing this biography. He is said to tell the true story of Verlaine's life, which has in many ways been falsely reported.

Northern and Central China, as seen during nine years of survey and exploration are described by Lieut.-Col. Wingate, in the *Geographical Journal* for March. The general impression which he leaves is that there is substantial progress in China. In two large cities in a central province he found "splendid schools and hospitals" in full operation, while some of the villages had "of their own free will, destroyed their idols," and the inhabitants of this province are "anxious for all modern and Western improvements." In the north the decay of the lama religion was evident, for not only is there a large falling off in the number of Mongol pilgrims, but the 360 temples recently to be found in a sacred valley had become 107 at the time of his visit. In regard to railway construction and the development of the mineral wealth he believes that the Chinese would welcome foreign capital, provided they could have a share in the control of the enterprises. In the animated discussion of the paper by members of the Royal Geographical Society, Sir Claude Macdonald pays a warm tribute to the valuable services of Herbert G. Squiers at the siege of Peking in 1900. Other articles are upon the work of the Anglo-German Boundary Commission in East Africa by the English commissioner, Capt. G. E. Smith, and on a new British Antarctic expedition by its organizer, E. H. Shackleton.

The Concordance Society, originating in a suggestion made by Prof. George Herbert Palmer of Harvard, was, as we noted in our issue of January 3, organized during the session of the Modern Language Association at New Haven. The following officers were elected: President, Albert S. Cook, Yale; secretary, Charles G. Osgood, jr., Princeton; treasurer, Curtis H. Page, Columbia; executive committee, the officers, with Charles W. Hodell, Woman's College, Baltimore, and Albert H. Tolman, University of Chicago. The purposes of the society are "to provide subventions toward the publication of such concordances and word-indexes to English writers as shall be considered sufficiently meritorious and necessary; to formulate plans for the compilation of such works; and to assist intending compilers of such works with suggestion and advice." Members pay five dollars a year, due May 1. As the society will disband if a hundred members are not secured by May 1, applications for membership are desired, and may be sent to any one of the officers. The society now has about seventy members, including such well-known names as Profs. William James, George L. Kittredge, and Barrett Wendell at Harvard; Charlton M. Lewis, Wilbur L. Cross, and William L. Phelps at Yale; Henry van Dyke and Theodore W. Hunt at Princeton; and Caleb T. Winchester at Wesleyan.

The recently formed Champlain Society, with headquarters at Toronto, intends publishing two volumes annually. It has in the press an English translation, accompanied by the French text, of Marc Lescarbot's "Histoire de la Nouvelle France." The translation is the work of W. L. Grant, Beit Lecturer in Colonial History at Oxford, and the Introduction will be contributed by H. P. Biggar, author of "The Early Trading Companies of New France." To be published also during 1907 is a new edition with translation of Denys's "Description Géographique," a rare book, published in 1672, describing the North American coast. This work is in the hands of Prof. W. F. Ganong of Smith College. Prof. W. Bennett Munro, of Harvard is also editing for publication this year a volume of hitherto unpublished documents relating to the Seigniorial Régime in Canada. This will supplement his work on the Seigniorial System in Canada, which Longmans, Green & Co. will publish at once. Prof. Adam Shortt, of Queen's University, Canada, is also editing for appearance this year a volume of "Cartwright Papers," dealing with the Loyalist movement from the United States to Canada, and with the early history of the present Province of Ontario. The Society has many other volumes in preparation and promises to be very active. The membership is limited to 250, and libraries are accepted as subscribers to the additional number of 250.

The seventh annual report, just issued of the New Jersey Library Commission, says:

When the report of the New Jersey Library Association was made in 1900 with a view to the securing of a library commis-

sion, only seventy-six libraries were reported, of which forty-seven were free. We have on record to-day 150 libraries, 99 of which are free. Twenty-two of the subscription libraries reported in 1900 are to-day free public libraries.

In 1900, the total circulation of books in the State was reported as 1,604,044. Last year the circulation for the State amounted to 5,889,000. Of the 150 libraries of the State only five public libraries have as much as 25,000 volumes, and thirty of them have less than 1,000 volumes. Of the various operations of the commission, the one in which most satisfaction appears to be found is the supply of travelling libraries to small communities. With a total stock of but 6,500 books, 457 libraries were sent out during the year, having a total book circulation of 71,000 volumes. Eighty per cent. of these libraries went to the rural districts, where the demand for books on history, biography, and the useful arts was so great as to bring the percentage of fiction circulated by the travelling libraries down to 49, "a much lower rate than can be shown by any public library in the State." In addition to this direct service, the travelling libraries have promoted the establishment and efficiency of permanent libraries in small communities. As showing the great popularity of the travelling library system in the rural districts, expressions of approval are quoted from various sources, one from a farmer's grange, which passed a unanimous resolution that "the travelling library law has worked more for the pleasure, culture, and welfare of the farming district than any law passed in years."

The uniform pronunciation of Latin in the secondary schools in England has been ordered in a circular just issued by the Board of Education. After reference to the very serious inconveniences which have arisen from the want of a common and fixed system of pronouncing Latin, all the schools recognized by the board were directed to follow the scheme adopted by the Classical Association and approved by the Philological Societies of Cambridge and Oxford and other learned bodies, in which proper attention is given to quantity. The order will go into force at the beginning of the next school year.

St. Albans, England, is to have an historical pageant, in which citizens of the entire County of Hertford will join. Among the events to be portrayed are Cæsar's defeat of the Britons under Cassivelaunus, B. C. 54, the invasion under the Emperor Claudius, A. D. 45, Boadicea's attack on Verulamium, the persecution of the Christians under Diocletian and the martyrdom of St. Alban, the funeral of Queen Eleanor, the Peasants' Revolt, the Second Battle of St. Albans, 1461, and the visit of Queen Elizabeth to Sir Nicholas Bacon at Gorhambury, 1572.

Dr. Albert S. Gatschet, for twenty-eight years attached to the Bureau of Ethnology of the Smithsonian Institution, and one of the highest authorities on the languages and dialects of the American Indians, died in Washington on Saturday. Born in Switzerland in 1832, he studied at Berne and Berlin. Coming to the United States in 1868, he soon began his work on Indian dialects and languages. At that time research in this field was almost unknown and few systematic efforts had then been made to analyze the native linguistic stocks. Besides analyzing and classifying the Indian texts which were turned over to him from the extensive collections of the Smithsonian Institution, Dr. Gatschet spent many years travelling among the Indians and studying their language at first hand. He published in 1884 "A Creek Migration Legend," in 1890 "The Kiamath Indians of Southwestern Oregon," and was, of course, a constant contributor to the publications of the Bureau of Ethnology.

Paul Guiraud, professor of ancient history at the Sorbonne, has died in his fifty-seventh year. He was deeply versed in the constitutions of ancient Greece and Rome. Among his writings are "De la propriété foncière en Grèce jusqu'à la conquête romaine," "Travail en Grèce," and "Études économiques sur l'antiquité."

The death is announced of André Lemoyne, the Parnassian poet, at Saint Jean d'Angély, in his eighty-fifth year. His first book of poems was "Les roses d'antan."

HENRY JAMES ON AMERICA.

The American Scene. By Henry James. New York: Harper & Brothers. $3.

Mr. James is a native American, and there are passages in this book which certainly could not have been written by one born under other skies. And yet, in general, he appears as a curiously alien observer, one who has been unable to realize in his own breast the feeling indicated in Goethe's words, "Hier oder nirgends ist Amerika." Mr. James's chief interest lies in the hallowed associations of what he terms the "whole precious past"; he has little but misgiving and suspicion for the new and untried. The interest offered by the "promiscuous packs and hustled herds" of America is to him simply, or at any rate predominantly, "queer." He assumes that the greater depth and urgency of his own sentiment about the past are in themselves proof that such past is more interesting than the present; the early associations of the Boston Athenæum, for example, far outweigh the connotation of the Boston Public Library. Human beings without an imaginative recognition of the past are to him almost a negligible quantity, and he fails to see that the indulgence of this view is practically to ignore the great bulk of Americans. He comes to his task saturated with the conventions, the ideas, and the ideals of an older and more sophisticated civilization, of a sheltered and intellectually fastidious *milieu;* and by this standard he insensibly measures all American institutions and tendencies. Thus it is that there have been foreign observers, such as James Bryce, who have been, so far as sympathetic insight goes, more American than Mr. James.

Mr. James repeatedly refers to himself as the "Restless Analyst"; and this phrase gives the reviewer an excellent clue for his summary of the book. "The American Scene" is a work of marvellously keen and subtle analysis; it transfixes the defects and shortcomings of American civilization with unerring thrusts; but it is less successful on the positive and synthetic side. Its vision is, if anything, too personal, too microscopic. We are driven to accept Mr. James's own statement that he has a bad habit of receiving through almost any accident of vision more impressions than he knows what to do with. As a result, we gain a hugely interesting reflection of what America seems to Mr. James, but we cannot help feeling at times that the camera obscura is an observer merely, not an interpreter.

Taking the book simply for what it is, however, we can surely describe it, if not as one of the greatest works on America, at least as one of the most fascinating to which the subject has given rise. The passages reminiscent of the scenes of Mr. James's boyhood are charming; and we are grateful for certain little fragments of autobiography. Nothing can be more vivid and discriminating than his descriptions of American scenery, such as of New Hampshire or Florida; nothing more happy than his reproduction of the atmosphere of such a place as Concord. His characterization of the different American cities is extraordinarily acute. No other writer on America has made shrewder observations or gathered up certain classes of facts under more illuminating labels. He is deeply sensible of the obtrusiveness of wealth in the United States, where he finds the main formula to be to "make so much money that you won't, that you don't 'mind' anything." He resembles other commentators on America in his preoccupation with the question of Woman; but none has equalled the aptness of phrase in which he crystallizes his impressions. He sees that the sexes "fail to keep step socially." He notes that the rustle of American petticoats is "too distinguishable from any garment-hem of the sacred nine." It is, perhaps, characteristic of his point of view that he seems to regret the absence of any male presence of native growth to whom the wearers of American tiaras might suitably curtsey. "Woman is two-thirds of the apparent life—which means that she is absolutely all of the social." In Washington alone does man enjoy enough of social existence (*i. e.*, one independent of the market) to make it conceivable that he will ever catch up with woman. Apropos of the American failure to appreciate the blessings of privacy, Mr. James is tempted to ask whether the hotel spirit is not the "American spirit most seeking and most finding itself." In Europe there are endless things behind and beyond the hotel, in the States (he uses this, to the American, objectionable name) the hotel itself constitutes for vast numbers of people the richest form of existence. Mr. James's treatment of the South, in his chapters on Richmond and Charleston, is especially subtle and sympathetic. It is interesting to find that he regards "The Souls of Black Folk," by W. E. B. Du Bois, as "the only 'Southern' book of any distinction published for many a year."

Of the verbal felicities marked for possible quotation only a very small selection can be given: The first scarlet maple of the fall is like "the daughter of a noble house dressed for a fancy ball, with the whole family gathered round to admire her." The streets of Boston and Cambridge present a picture of "extraordinary virtuous vacancy." The university is the "place inaccessible to the shout of the newspaper." New York, seen from the

river, is a "pin-cushion in profile." The Ocean Drive at Newport is "a proof of the possible appeal of scenery, even to the dissipated." Whether or not the general style of the book is found acceptable, must depend largely on the temperament of the reader. Its verbal subtleties sometimes remind one of a swordsman, who, having exhausted all the legitimate arts of his profession, now shows his skill by using his weapon as a vehicle of legerdemain. We find ourselves at one time half resenting the apparently needless amplification of theme, at another wondering whether, after all, the desired cumulative effect could be attained in any other way. If one owns to a more frequent experience of the former state, it is at least easy to sympathize with those who take the opposite view. When Philadelphia is admirably pigeonholed as the only large American city that doesn't *bristle*, we feel some sense of exasperation on finding that nothing is left to our imagination and that the idea is beaten out thin over several pages of explanation.

In conclusion, we come back to our initial impression that Mr. James is fundamentally incapable of getting inside the skin of the average American or of realizing that the outlook to such a citizen is by no means so dreary and "common" as to himself. He writes of America as an able but unsympathetic adult might write of the games of a child; the effect is as of a study of human nature by one to whom a refined and sophisticated elderly gentleman is the only type of interest. Given this point of view, the book is as fascinating as it well could be.

RECENT FICTION.

Her Majesty's Rebels. By Sidney Royse Lysaght. New York: The Macmillan Co.

Whether it be the national wrongs or the national character, the Irish novelist always starts with the immense advantage of a vertebrate theme upon which to construct the body of his story. Consequently, the national issue being still a living one, many an antiquated Irish novel keeps an astonishing measure of life. Thus it is that treatment so deliberate and old-fashioned as Mr. Lysaght's hardly detracts from the interest of his picture. In "Her Majesty's Rebels" he frankly uses the career of Parnell, merely modifying incidents to suit the demands of fiction, as when "Desmond" meets a violent death—the natural outcome of a necessary episode.

The story hangs loosely together and is curiously superficial in its analysis; or, to speak more exactly, Mr. Lysaght often shows a keen perception of character without the art of sustained development. Many of his people are quite shadowy. He is likewise guilty of self-indulgence in the matter of length. The conversion of a ruined country-seat into a prosperous hotel is gone into so thoroughly as to resemble a practical lecture on thrift. Nevertheless, the book as a whole breathes a genuine interest in people and conditions—an interest which, granting defects, still puts it in the class of thoughtful novels which can be read by the leisurely.

There is a quiet candor about it, equally remote from Mr. Thurston's passionate indictments or Miss Laffan's, and from the idealizing of Mrs. Leary and Miss Barlowe or the exuberance of "Charles O'Malley" and "The Experiences of an Irish R. M." Except in the case of Mr. Thurston, who delights in smashing the myth of a warm-hearted, romantic peasantry, Irish story-tellers are more or less bound to fall in with the conventional effigies of their countrymen. This danger Mr. Lysaght does not wholly escape, but in certain scenes between Desmond and the lady of his undoing there is no want of originality and penetration; and in describing Michael Desmond himself there is a laudable lack of shirking. The entire episode is gravely and delicately told with a kind of tolerance which distinctly strikes its own note in Irish fiction. Throughout a quiet honesty struggles to overcome the established tradition, and this honesty conquers as far as to suggest that, given fuller rein, it may end by enabling Mr. Lysaght to forget his models and use no eyes or tongue but his own in depicting his own world.

The Cage. By Charlotte Teller. New York. D. Appleton & Co.

This is a socialistic novel, of which the scene is laid in Chicago's West Side. In the first chapter is introduced the Rev. Dr. Hartwell, who has left a prosperous church and come to live in the lumber district, preaching the Gospel to the dingiest poor, while his daughter and a woman disciple do the work of the house and strive to elevate the neighborhood. In the next chapter arrives Eugene Harden, steeped in the most advanced European socialistic theories, fleeing from the cage of Austrian law to labor in the new world for his ideals. Dr. Hartwell's point of view is, "But we must teach these working people to respect the laws of the land." Harden's is, "We must change the laws so that they can be respected." Sloane's is that of the egotistical philanthropic employer. The women in the book take theirs from the men with whom they are in love. The author's may be inferred from a few specimen extracts:

> It was the army of industry out for its early morning review, going into the day's service without recognition from those who were to be served, those who still slept in warm beds, far away from the camp of war.
>
> Now he, too, . . . was in jail, and with all the public opinion stirred against these things for which he stood, believing that if a man said "dynamite" he was capable of using it, it would be very hard to expect leniency or even justice for him.

Of the Haymarket riots she writes: "The vanity of one man in the police force was to result in the murder, by the State, of seven innocent men."

In and out among these variants of opinion on the great question there wind two or three love stories. The finding of themselves and each other by the participants is as marked a feature of the story as the adjustment of views on Socialism, and is worked out with even more originality. If there is little plot, there is a deal of story. The behavior of Frederica at the crucial point of her destiny is almost incredibly melodramatic; but in the end Frederica's monologue explains Frederica not unreasonably. It is a readable book rather than a conclusive one; interesting, rather than valuable; a ramble, by turns painful and pleasant, rather than an arrival.

Mary. Fortaelling av Björnstjerne Björnson. Copenhagen: Gyldendalske Bohandel.

For more than fifty years the names of Ibsen and Björnson have been coupled together. Ibsen, the elder by four years, is dead and buried; Björnson, now seventy-four, seems as youthful, as energetic, as enthusiastic as ever. During the last few years two dramas and a novel have come from his pen, besides many magazine articles, and now the publication of his novel "Mary" is the principal event of the Scandinavian literary world this winter. The novel illustrates vividly not only the differences between the manner of Björnson and that of Ibsen, but also the specific merits and shortcomings of its author. If a paradox may be forgiven, Björnson is a born singer, who always produces political, scientific, and sociological pamphlets, while Ibsen was a synthetic philosopher producing works of pure art. Ibsen never preached, and yet every one of his works is a sermon; Björnson cannot put pen to paper without preaching, and yet the result is a song—a sermon, one might say, that holds the reader spellbound by its rhythm and harmony. Ibsen was a wholly objective observer, standing apart from life that he might see it in perspective. Björnson must needs plunge into the deep currents, struggling to shape their course to suit his own ideas of right and wrong. It is difficult not to regret his lack of aloofness at times, and it is equally difficult not to wonder, seeing how closely he approaches a success not belonging to the poet, but to the seer and philosopher.

Sex morality constitutes the theme of the present story. The view of the author would probably give considerable offence here in the United States, although the language is completely free from anything objectionable. The position of woman and her relations to the man have ever been subjects tempting to Björnson, and particularly since, following Ibsen as usual, he passed from romanticism to realism. That morality which demands of man either that he enter marriage as free from taint as the woman, or that he forego any demand for purity on her part, is still called "the Gauntlet moral" in Scandinavia, after the name of the play through which Björnson first advocated it. His latest book may be called a corollary to "A Gauntlet." The main points laid down by Björnson in "Mary" appear to be these: That woman must be sole and complete master of herself; that it is "immoral" for any man to assail this mastership by trick or force; that respect of it is neither incompatible with a frank recognition of sex attraction nor guaranteed by the conventional "chivalrous" attitude; that woman has not only the right but the duty to give herself wholly to the man she loves, provided that he meets her in the same spirit; that in the giving of herself thus there can be nothing immoral or wrong, nothing that should lower her in the opinion of any man; that, finally, a voluntary surrender of the kind mentioned does not give the object of her love any claim on her beyond what she voluntarily concedes to him. Not "free love," but what he would call full and fair reciprocity between man and woman, is

what Björnson asks for. The old-fashioned, conventional view of woman as a prey to be caught is to him hateful and false. His ideas are those of Whitman and Meredith.

In embodying these ideas in dramatic form, he has wrought a charming and intimate picture of a young woman's soul. It is hard to tell which one of her two dominant qualities captivates and fascinates most: her sweetness or her bravery. From her earliest childhood we see her grow into greater and greater understanding of her own self, and out of this knowledge springs a steadily increasing consideration for others. It is for his sake, and not for her own, that she gives herself unconditionally to her lover. And it is when this precious gift produces in him not reverence, but a sense of ownership, that she wakes up to his true character and the dangers threatening her right to live a life of her own by his side. When, at last, she finds herself confronted with two alternatives equally menacing, when her only choice seems to lie between marriage to a man she has come to despise and exposure to the world, the story develops into sombre tragedy. She is, indeed, saved from the unworthy lover and from the world, but the "happy ending" is a natural result, and not forced.

The Golden Days of the Renaissance in Rome: from the Pontificate of Julius II. to that of Paul III. By Rodolfo Lanciani. Boston: Houghton, Mifflin & Co. $5 net.

A book by Commendatore Lanciani is sure of a popular welcome. No other scholar of his attainments in the history of Roman topography has been able, or has tried, to attract to his subject the flitting attention of the gentle reader, to draw from accumulated stores of technical knowledge the material for charming *causeries*, and so to communicate something of the romantic delight of archæological investigation to those who would otherwise be confined to the marvellous instructions of the peripatetic lecturer in the ancient city itself. The general attractiveness of Lanciani's writing is indubitable. His sentences run fluently. He is singularly effective in the manner of telling the story as it were to a single listener. This intimate, personal tone, joined with a large, airy manner of cheerful, offhand acquaintance with the subject that may disdain the formalities, is unique in the treatment of such themes. And Lanciani also has the true, ancient feeling for the magic of thickly falling proper names, those crowded connotations of all romance, that, whether we know who's who or not, by the liquid music of their flowing syllables enchant and capture ear and mind together, and make even the baldest geography and the dullest chronicle into epic.

The chronological limits set by the author in his title are nearly coterminous with the first half of the sixteenth century; for Julius II. (della Rovere) ascended the papal throne in 1503, and Paul III. (Farnese) died on the 10th of November, 1549. The book has seven chapters, treating, according to the table of contents, of The City, Life in the City, Paul III., Michelangelo, Vittoria Colonna, Raphael, and Agostino Chigi. But to expect to find, even in the first two chapters, the titles of which are most hopeful, a consistent and well-developed presentation, from which the reader could carry away a clear picture of Rome and Roman life in the first half of the sixteenth century, is to expect from Lanciani an impossibility. As well think to find a history of English literature in the pages of the unabridged dictionary. Much of the material is there, or is hinted at, and it is charming material; but it is heaped together in a disorderly mass, as bewildering as the pile of grain that Psyche had to assort. One admires and laughs and scolds, all at the same time. It is the old story. The writer can hardly hold himself down for two consecutive minutes to the topic he has in hand. He must get a running start. And so in his first sentence he goes back to the year 1377 and the pontificate of Gregory XI., and uses up twenty-three pages out of the fifty-six in the chapter before he comes to the sixteenth century at all. Then he essays a panoramic view of the city from the Capitol; but he cannot bridle his imagination enough to refrain from pointing out things that had disappeared long before, and whatever he does see links itself with so much of reminiscence and prophecy that he forgets what we stand there for. Each single item is felicitous in itself, but where is the view? We cannot see the forest because of the trees.

This is an ingrained fault in much of Lanciani's otherwise charming writing, and it appears more exaggerated in this volume than in its predecessors. Another fault is the tendency to inaccuracy, which appears so frequently in matters that can be checked, that it arouses distrust of the author's accuracy in matters of perhaps greater moment that lie within the scope of his peculiar knowledge. Why, for example, should he (p. 20) set down 260,000 ducats as equal to $2,000,000, when only four lines below he gives $300,000 as the equivalent of 60,000 ducats? Why should he (p. 145) translate *urbs situ et diuerticulis uiarum deformis et imperuiâ* by "the city, disfigured and made uninhabitable by the narrowness and tortuosity of its alleys"? *Imperuia* is not "uninhabitable," *situ* has nothing to do with "narrowness," and *uiarum* is not "alleys." These are but samples.

The old warning of *ne sutor supra crepidam* might well have been remembered by Comm. Lanciani, when he was setting down with easy confidence certain of his offhand opinions on things quite aside from his special line of knowledge. He illustrates the alleged degeneration of the carnival in the process of its importation from Venice into Rome by the statement (p. 37): "The Grecian athletes, once transplanted to Rome, became gladiators." That is history topsy-turvy indeed, and much tangled in the bargain. The ancient pedigrees claimed for certain Oxford colleges are put to shame by that devised by Lanciani for the University of Rome, "the origin of which," he solemnly affirms, "dates back to the time of the Alban kings, when the young representatives of the Alban race were sent to Gabii, the city of learning [this is news, indeed, about Gabii] to become familiar with the Greek language. After the capture of Gabii by Tarquinius Superbus, the central Latin national school [!] must have been transferred to Rome [!], where we shall not attempt to follow its fate during the rough republican times, nor its transformation into the celebrated [!] *Pædagogium puerorum Kapitis Africæ* under the Empire." The printing of such nonsense is an affront to common sense and common knowledge that needs much atonement.

Comm. Lanciani does not shrink from *obiter dicta* on topics of ecclesiastical history. He sneers at those who placed Giordano Bruno's statue in the Campo de' Fiori, and he asserts that "the philosopher of Nola was as much of a believer as the most devout Catholic, and gave up his life not for any questions connected with the doctrines of the Church, but for its moral purification." This is in direct contradiction of the facts that appear in Bruno's own writings, and in the contemporary accounts of his trial. It can, perhaps, be said that he died for the principle of freedom of thought and speech, but the charge was heresy, and among the specifications were clear denials of certain articles of the creed. That he did deny them was plainly shown, and is evident now in his works; and in his own defence he put forth the curiously scholastic plea that while he did, indeed, acknowledge that he held and promulgated the views attributed to him, he held and promulgated them only as a philosopher, while as a Christian he accepted the Church's teaching in its entirety. The Inquisition finally decided to burn the philosopher, and apparently the Christian did not survive. Doubtless if Bruno had lived at the present day, he would have modified his plea, and claimed that his verbal denials of the creed were only in the interests of a higher spiritual interpretation thereof. What the result on his fate would have been, we can only surmise; but it is singular how many ecclesiastics, even at this day, appear incapable of comprehending such philosophical niceties.

In spite of the unfortunate constitutional defects that have been mentioned, the book affords very much valuable instruction, both in word and in picture, for which even the serious student should be grateful. It is to be hoped that, when his documentary "Storia degli Scavi" is completed, the author may give us a straightforward history of the survivals of ancient Rome during the entire period covered by that massive work.

Modern Poets and Christian Teaching. Robert Browning, by Frank C. Lockwood; Matthew Arnold, by James Main Dixon; Gilder, Markham, and Sill, in one volume, by David C. Downey; Lowell, by William A. Quayle. New York: Eaton & Mains. Each $1 net.

It is a difficult and delicate enterprise to determine from his poetry the religious beliefs of any poet. On the one hand lies the Scylla of over-ingenuity which lures a critic like Dr. A. W. Verrall to detect atheistic innuendo in perfectly innocent passages of Euripides; on the other yawns the more dreadful Charybdis of mere platitude and the self-evident, seldom avoided by those who have discoursed on the religion of Æschylus or Pindar. But even those who dissect Euripides, and have to balance the "Bacchæ," with its moral of implety punished, against the "Ion," where the most

radiant god on Olympus is the consistent villain of the piece, find their path clear compared with one who must label with its precise shade the Christianity of a clergyman's son with Neo-Greek tendencies. Most difficult of all is to define the religion of a poet whose long gallery of dramatic characters speak each from his own standpoint, and refine and argue, while the reader must be on the watch for their creator, in one of the "many movements of his mind," to throw them over with perhaps no more than the turn of a phrase.

Confronted in Browning with this last problem, Mr. Lockwood derives from his poetry precisely what he went forth to seek, "great spiritual teachings," and a complete acceptance of Christian tenets.

> He accepted the life and teachings of Christ as adequate, authoritative, and supreme in the spiritual realm. . . . Christianity, and Christianity alone, solved this question for Browning, . . . the divinity of Christ afforded him the necessary connecting link with the infinite and eternal (p. 145).

So Mr. Lockwood. On the other hand, Prof. Josiah Royce, on the strength of the same poems, and Mrs. Sutherland Orr, who adds to her knowledge of the works an intimate acquaintance with the man himself, expressly deny the orthodoxy of Browning. It is hardly a case for compromise. If the poet is speaking his own convictions in "La Saisiaz," where he leaves himself a hope for immortality that is far from the radiant faith of the Christian, he cannot fairly be identified with the elderly lover in "Evelyn Hope," a poem from which Mr. Lockwood gathers a direct message of immortality. Nettleship used a strong phrase for those who read into Browning's poetry their own theological creeds. He called it "poisoning the wells."

It is, however, a more gracious task to find orthodoxy where it probably is not, than to denounce its complete absence. That is the aim of Mr. Dixon's volume on Matthew Arnold. The search had better have been left untried. What Arnold was to his generation was summed up long ago by R. H. Hutton:

> No one has expressed more powerfully and poetically its spiritual weakness, its craving for a passion that it cannot feel, its admiration for a self-mastery that it cannot achieve, its desire for a creed that it fails to accept, its sympathy for a faith that it will not share, its aspiration for a peace that it does not know.

Mr. Dixon's title-page reminds one of that famous chapter-heading, "Snakes in Ireland." To scold Arnold through 160 pages, and call him a Sadducee because he was not happily able to accept a creed, is simply to have an eye closed to beauty. Mr. Dixon cannot abide the Hellenism of Arnold, and especially condemns the 'Memorial Verses" to Wordsworth, because Arnold did not in them dwell, as Whittier did, on the Christian element in Wordsworth's poetry. When he calls Arnold's tribute "æsthetic or artistic," "fanciful and literary," he is evidently using terms of strong disapprobation. We wonder what he makes of Wordsworth's sonnet, "The World," with its yearning for the younger earth of the Pagans, a longing never even in Arnold more poignantly or directly expressed. But it would indeed be time wasted to stay to prove that a modern poet cannot be expected on all occasions to edify the orthodox theologian. Mr. Dixon, having devoted two pages to reproaching Arnold for a well-known misquotation of a line of Keats—Arnold wrote "cold" for "pure" when he quoted a famous sonnet in his "Essays in Criticism"—himself misquotes Arnold's "Memorial Verses," reading "path" for "lap" (p. 53), an error of about the same importance.

Of the third volume of this series there is little to be said. Two of the poets treated are still alive, and we doubt whether the question of the exact amount of a writer's contribution to didactic Christianity can with any fitness be weighed under those conditions. Mr. Downey is the most liberal of the three critics in his interpretation of the word Christianity and in detecting its essential truths in his three poets.

It is when we turn to the volume on Lowell that we feel most strongly that Religious should have been substituted for Christian in the title of this series. As it is, the critic must nearly always either fall back on the widest possible interpretation of the word Christianity and forego all essential tenets, or he must frankly denounce the lack of orthodoxy, and make the most of what is left. The latter course is chosen by Mr. Quayle. One who insists that poetry shall be "sermonic," to use his own word, has, in fact no choice but denunciation when he must analyze such a poem as "The Cathedral."

> The doubt element is expression of the age. No one doubts that. The atmosphere is accurate. We fault not that. But where the fault lies as a Christian poem is, it fails because it does not journey far enough. It gropes to the end. That is not Christian. 'Tis a theistic poem, truly, but not a Christ poem. There lies its lack, its fallacy, its absence of a song. A great Christ had with our poet drenched his "Cathedral" with music outsounding seas, making one look to find the angels who made the ecstasy. . . . Lowell's religious faith is not vital. His head had not, I take it, gotten where his heart had come.

So says Mr. Quayle, in English which suggests that he is unaccustomed to writing down his thoughts.

The aim of the whole series is mistaken. Here we have men accustomed to preach, and very properly regarding that as the highest mission of a man's life, measuring the souls of artists and their chances of edifying their generation by the amount of direct preaching that can be detected in their verses. "Tennyson's accent is wrong," says Mr. Quayle of the famous line on "honest doubt"; wrong for a sermon, certainly, but Tennyson did not happen to be writing for the pulpit.

Through the Gates of the Netherlands. By Mary E. Waller. With illustrations by A. Montferrand. Boston: Little, Brown & Co. $3 net.

Many have been the volumes about the Netherlands issued during the past few years. This newcomer is, however, differentiated from its fellows by certain characteristics. The writer not only entered the gates, but she stayed within them for months instead of weeks. Moreover, those months were from midwinter to midsummer when Holland belongs to the Dutch, and when ordinary tourists are not swarming over the land for three-day trips. Finally, the writer uses her own eyes and describes her impressions and experiences entirely from the legitimate point of view of an intelligent foreigner, instead of filling her pages with diluted Motley, Amicis, and Baedeker. Her kind of enthusiasm betrays a familiarity with the first author, such as a good American should have, whether he be critical or not; with Amicis she differs wisely, while the third is practically untouched. Little aid, indeed, would Baedeker lend to travellers like the "James" and "Persis" of this book. They were original enough to take a villa at Scheveningen for the winter, making that a base of operations for seeing Holland. The pair learn to know something of life as it passes in a fishing village typically Dutch in spite of its accessibility to strangers and its vicinity to its dissimilar twin, the summer city. Possibly this "unspoiledness" is due to the fact that the Scheveningen fishers became accustomed to the presence of strangers long before Amicis wrote and before Baedeker tagged places with a star. Certainly, as the reviewer can testify, they seem far more unconscious, less affected by the injudicious comments of tourists than are the people of Marken, Vollendam, or Zaandam.

In the four months' residence of this pair of Americans, "Persis" has time to explore the village and The Hague, and above all she has leisure to grow intimate with the metamorphoses of dunes and sky. Was ever a sky so full of events as that which hangs low over the edge of the North Sea? There the infinite possibilities latent in modest gray can be watched. The marvellous play of light—and it is only an insinuating luminousness, not a powerful light—can make the whole vault of heaven companionable. That the writer of this book gained a real personal intimacy with that strange variety in sameness, is evident. Very sympathetic is her touch on the qualities of land and sea and sky, and her words are not hackneyed. Less intimate than the picture of Scheveningen are the views of the rest of the country taken as the party, finally numbering six, journeys on a boat yclept The Broomstick, through the waterways of the Netherlands. But the impressions are still at first hand.

The lingering leisure given to the art of the Netherlands also makes itself felt when the pictures are spoken of—Vermeer's Delft in the Mauritshuis, for example. How many visitors not actual art students have time to know it? Curious, however, that the Burgomaster Six is not classed among Rembrandt's masterpieces. To many eyes his is *the* portrait in Holland. The appreciation of Israëls is very real. There are others besides "James" who have realized the singular intensity of Alone in the World, universal yet of one locality.

Into the chronicle of the voyage, a story, two stories, are lightly woven. They are little advantage to the book, which is primarily descriptive, not romantic. Besides, the attempt at love passages is suggestive of Black's style in his records of the phaeton and the houseboat wanderings, and hence a blemish to the real originality of the rest of this volume. On the other hand the illustrations are charming, and sufficient to tempt other travellers through the Gates of the Netherlands.

Harsha Vardhana, empereur et poète de l'Inde septentrionale (606-648 A. D.). Etude sur sa vie et son temps. Par Maurice L. Ettinghausen. Paris: Ernest Leroux.

The old year, just closed, was the thirteen-hundredth anniversary of the first year of the reign of Harsha Vardhana, or Sri-Harsha, a poet-king who ruled over Hindustan in the seventh century of our era. The date of this sovereign's coronation, or "anointing," as the Sanskrit phrase would express it, was 606 A. D. No European potentate at that time, however, could know that a really great contemporary had ascended the Indian throne to rule over millions of subjects. Nor does India to-day remember the event, but has had to be informed once more about her forgotten monarch's reign, which was so beneficent that a Chinese pilgrim who journeyed through the king's realm said of the Blessed Harsha:

> He practised to the utmost the rules of temperance, and sought to plant the tree of religious merit to such an extent that he forgot to sleep and to eat!

It is due to the patient labor of Sanskrit scholars, aided by Chinese philologists, that these missing pages of Indian history have been restored and a full record made of Harsha's reign. These faithful investigators, by means of inscriptions, literary monuments, and the documentary evidence of Chinese Buddhists, have recovered the lost fact that the reign of Harsha over a powerful kingdom in Northern Hindustan, between 606 and 648 A. D., deserves to rank with that of the earlier Buddhist Emperor, Asoka, or of the later religious eclectic, Akbar the Great. Two inscriptions on plates of copper and also a copper seal, which was probably once attached to a royal grant of land, preserve the lineage and some other biographical facts regarding this powerful Maharaja; and his name is mentioned also in some inscriptions of contemporary rival kings. When combined with the narratives of the pilgrims who came from China to India during his lifetime or after his death, and when brought into closer connection with some poetical compositions and three Sanskrit dramas which bear Harsha's name as author, these materials, together with certain other literary and epigraphic evidences, serve to give a connected outline of the main events of the monarch's career.

The materials have been accessible to Indologists heretofore only in a scattered form, but it remained for the skilled hand of a young French-English scholar, Maurice Ettingbausen, to bring the *disjecta membra* into a single book. This young Sanskritist, who has enjoyed the advantage of philological training at London, Oxford, and Paris, finishing his studies under the admirable guidance of Professor Sylvain Lévi of the Sorbonne, has produced an excellent book. The political and literary history of Harsha's empire are presented in clear outline, and the author has made good use of the Chinese writings to throw light on the social condition of India in Harsha's time. In the account of the attempt made by Sasanka, an enemy of Harsha, to destroy the sacred Bo-tree, under which Buddha sat, there might have been added a reference to the same event, as recorded in the Chinese biographical work "Sü-kan-sŏng-chuan." Full justice, however, is done to all the Chinese throughout the work, and it is very convenient to have the inscriptions and the verses of Harsha's own composition reproduced in the appendixes at the end of the volume. It is to be hoped that in a second edition of this standard work on Harsha, there will likewise be reproduced a specimen of the king's beautiful chirography, which has actually been preserved in the king's own signature engraved on the Banskhera plate. It would be well likewise to reproduce from the Ajanta Caves the painting which represents King Pulikesin, the victorious rival of Harsha in Southern India. A good map indicating the precise extent of Harsha's domain and the many places alluded to in his history would be serviceable. These would add still more to the praise to be deservedly bestowed upon this valuable historical treatise.

The Religion of All Good Men, and Other Studies in Christian Ethics. By H. W. Garrod. New York: McClure, Phillips & Co. $1.20 net.

Christianity in the Modern World. By D. S. Cairns. New York: A. C. Armstrong & Son. $1.25 net.

We may consider together two thoughtful essays on the present status of Christian faith, by writers who discern with uncommon keenness the difficulties in the way of belief, and with equal sincerity and earnestness of conviction arrive at radically opposite conclusions. Mr. Garrod, a Cambridge tutor, writing from the point of view of educated young men of Great Britain, declares that "there is a widespread dissatisfaction with the moral ideals of Christianity"; and Mr. Cairns, who is apparently a Scottish clergyman, also fixes upon defects in Christian morality as the chief stumbling-block in the way of belief. Here, however, the parallel ends, for Mr. Garrod pronounces Christianity insufficient, at least for himself, and confesses allegiance to ideals which he describes as Gothic; while Mr. Cairns endeavors to show that the social and moral teaching of Christianity has not been fully apprehended, and that a true appreciation of Christian ethics will discern in it the elements which seem to many to be lacking.

The notion that the Teutonic heathen have not been fairly treated by the appraisers of moral systems, that much that is valuable in the present life of the peoples of northern Europe had its origin neither in Judæa, nor in Hellas, but in the fens and forests of the early Teutons, finds facile and persuasive expression in Mr. Garrod's essay, "Christian, Greek, or Goth?" Chivalry and honor appear to him as elements of moral life, in which both Greek and Christian teaching are deficient, and these he finds to be the cardinal virtues of the North, which many have unconsciously grafted on Christian ethics, but the parentage of which it would be wiser to recognize, in the interests both of clearness and of faith itself. This thesis Mr. Garrod defends with much skill, and it can scarcely be denied that important truth at least lies close beside his propositions.

Mr. Cairns, who is no Goth, but a devout, though informed, evangelical, approaches the ethical criticism of Christianity through the famous passage in Mill's "Essay on Liberty" on the limitations of Christian morals. Mill, it will be remembered, pointed out that Christian morality is "negative rather than positive; passive rather than active; innocence rather than nobleness; abstinence from evil rather than energetic pursuit of the good"; and his conclusion was that "other ethics than any which can be evolved from purely Christian sources must exist side by side with Christian ethics to provide the moral regeneration of mankind." This serious criticism Mr. Cairns is at pains to refute. He contends, in the first place, that the spheres of obligation to which Mill could find no reference in the gospels were by no means ignored by the Galilean teacher, but that these duties were implied in his utterances concerning the kingdom of God. All that Mill would derive from sources other than Christian Mr. Cairns finds in germ, in general principle, in the Messianic hope which pervades the gospels. In the second place, he urges that the silence of Jesus concerning national and civic duties was not because he had no regard for these important elements of obligation, but because of the peculiarities of his position in relation to the civil authorities and to his disciples. The one-sidedness of his teaching is attributed to "spiritual strategy," as Mr. Cairns terms it. Finally, Mr. Cairns urges that in the utterances of Jesus in the form of apocalypse there is the equivalent, in the vocabulary of the time, of the duties which Mill and Mr. Garrod fail to find inculcated in the gospels.

A brief outline inadequately represents the clearness and logical skill of the argument, and the literary excellence in which it is framed. As a piece of Christian apologetic, the effort of Mr. Cairns is on a higher plane than that of much recent work. Whether it will be deemed a sufficient reply to those who complain of the moral limitations of Christianity, will depend upon the view one has of the history of New Testament times. To Mr. Garrod, for example, it would manifestly be no answer at all. He would reply at once that the Kingdom of God, as Mr. Cairns describes it, is a creation of the modern imagination, which did not at all exist in the days of Jesus and his apostles. Their kingdom, it is asserted, was not a society gradually coming to perfection, but an utterly marvellous display from the heavens, sudden in manifestation, miraculous, and without human agency in its projection upon the earth. In favor of this interpretation of the phrase "kingdom of God," there is much to be said; and Mr. Garrod advances this view skilfully in his able chapter on "Christ the Forerunner." Of course, if this conception of the kingdom be correct, there is no ground for the argument that in Jesus's command to seek the kingdom there is implied obligation of social and political duty. A kingdom about to descend as the lightning from heaven certainly imposed no obligation to purify water supply or to elevate the standards of education.

But is one forced to the dilemma implied by these two essays? What if the teaching of the man of Nazareth does not embrace a full-rounded ethical system? What if Jesus had no thought of a de-

veloping society? Must we, therefore, with Mr. Garrod, call ourselves Goths? Or, with Mr. Cairns, must we apply the microscope—and a little imagination—to the gospel records to derive thence all the virtues the hurrying times find needful? May not one whose religious inheritance goes back through Luther, Augustine, and Paul, write his estimate of the founder of his faith as he believes history teaches, not undertaking to impute to him an ethic for which the world had then no need, but revering him chiefly that he sowed faithfully the seed that was given to his hand, and left the world bravely with the question, "Why of yourselves judge ye not that which is right?"

Christopher Columbus and the New World of His Discovery. By Filson Young. 2 vols. Philadelphia: J. B. Lippincott Co. $6.50 net.

These two handsome volumes of English manufacture are offered to the reading public by the author, with a frank disclaimer of any pretensions to expert Columbian scholarship. Indeed he announces his belief that the original investigator in biography or history, consuming his life in the study of details, is thereby disqualified for the task of putting his results in an effective way before the public. "It would appear that the double work of acquiring the facts of a piece of human history and of presenting them through the medium of literature can hardly ever be performed by one and the same man." A wider acquaintance with historical and biographical literature would perhaps lead Mr. Young to be less sure of this dictum, against which exceptions in great numbers from Thucydides to Boswell could easily be cited. Mr. Young needs the shield of no such principle to justify his undertaking a life of Columbus, if he he so minded, but the defects of his own work illustrate the inevitable weakness of history written by one who has not saturated himself with its materials, but has merely skimmed the cream of others' research. Mr. Young's narrative is clear and interesting, but his comment is unhistorical in tone and often flippant. One example will illustrate our meaning. On November 4 Columbus records in his journal that he understood the natives to say that at "a long distance from there there were men with one eye, and other men with dogs' snouts who ate men, and that when they caught a man they beheaded him and drank his blood." Mr. Young does not question that the natives said this, not recollecting that, as it was only twenty-two days since Columbus had landed on Guanahani, he could not possibly understand the native language in such detail. Instead Mr. Young comments on the admiral's "solemnly" entering these facts in his journal: "It is the most childish nonsense." Of course it is nonsense to-day, and the reader hardly needs to be assured of the fact. What he does need, however, is to have it explained how Columbus could have thought he understood the Indians to give him such information. The proper historical comment is to note that the book of Sir John Maundeville, which enjoyed a high reputation in the admiral's time, records the existence off the coast of Asia of "a great and fair isle called Nacumera. . . . And all the men and women have dogs' heads," and again: "In one of these isles are people of great stature, like giants, hideous to look upon; and they have but one eye in the middle of the forehead." Columbus, having every reason in the light of accepted geographical authorities to expect to find monsters, not unnaturally interpreted any little favorable sign in that direction.

As a professed littérateur Mr. Young embellishes his sources with imaginative details. For example, the account of the conference between Columbus and the commission appointed by King John of Portugal to consider his project is pure fabric of the imagination. Mr. Young writes:

> Before these three learned men must Columbus appear a little less happy in his mind, and wishing that he knew more Latin. Master Rodrigo, Master Joseph the Jew, the Right Reverend Cazadilla; three pairs of cold eyes turned rather haughtily on the Genoese adventurer; three brains much steeped in learning, directed in judgment on the Idea of a man with no learning at all. The Right Reverend Cazadilla, being the King's confessor and a bishop into the bargain, could speak on that matter of converting the heathen; and he was of opinion it could not be done. Joseph the Jew, having made voyages, and worked with Behaim at the Astrolabe, was surely an authority on navigation; and he was of opinion that it could not be done. Rodrigo, being also a very learned man, had read many books which Columbus had not read; and he was of opinion that it could not be done. Three learned opinions against one Idea; the Idea is bound to go. Poor Columbus stands there puzzled, dissatisfield, tongue-tied.

Our only trustworthy account of this interview is that in the Portuguese historian Barros, who simply says:

> But they [*i. e.* the commission] regarded all the words of Christoforo Colombo as empty talk because it was all based on imaginings and descriptions of the Island of Cypango of Marco Polo.

These examples illustrate the weakness of the author's method. He has read his texts and studied his secondary authorities, but he cannot refrain from filling gaps with his own imaginative reconstructions or avoid a modern and unhistorical attitude in the interpretation of his material. Moreover, as a literary artist, having not heen satisfied merely to tell a story, he has interspersed his pages with reflections or reveries expressed in a style which may he described as diluted Carlylese. As good an instance as any is the concluding paragraph of his hook:

> So much of the man Christopher Columbus who once was and no longer is, perished, to the last bone and fihre of him, off the face of the earth, and living now only by virtue of such truth as there was in him; who once manfully according to the light that he had, bore Christ on his shoulders across stormy seas, and found him often, in that dim light a heavy and troublesome burden; who dropped light and hurden together on the shores of his discovery, and set going in that place of peace such a conflagration as mankind is not likely to see again for many a generation, if indeed ever again, in this much tortured world, such ancient peace find place.

From what we have said, it is clear enough that Mr. Young's work presents nothing of importance to the serious student. To the general reader it gives the story of Columbus's career illustrated more fully from Columbus's own writings (as published by John Boyd Thacher) thau any preceding popular life; and this is its saving quality. Yet the scholar cannot neglect entirely what Mr. Young's volumes contain; for he had the happy thought to ask the Earl of Dunraven to contribute what is too modestly called a "Note on the Navigation of Columbus's First Voyage." In this "note" the student will find the most lucid and satisfactory treatment of the subject known to the reviewer. For example, the perplexing passage in the journal under September 30 is not explained in any of the editions of that narrative. Of this the Earl of Dunraven gives a lucid explanation illustrated with diagrams. No student of the Columbus narratives will fail to find in this valuable essay an explanation of many things left partly or wholly in the dark by the editors of Columbus's writings.

Science.

THE AMERICAN MUSEUM EXPEDITION TO THE FAYÛM DESERT.

CAIRO, Egypt, March 1.

The Fayûm is a great natural basin lying just west of the valley of the Nile, about fifty miles south of Cairo. A large part of the basin is below the level of the river, and in the most depressed westerly portion lies the brackish lake called Birket el Kurûn, or Lake of the Horns, the surface of which is 120 feet below sea level. To the southeast of this lake is the fertile oasis of the Fayûm, intersected with irrigating canals fed, not immediately from the Nile (which is shut off by a stony barrier), but by a canal, the Bahr Yusef, given off far south. Directly north of the lake, rising step above step like a great amphitheatre, are the terraces of the Fayûm desert, one thousand feet thick, which culminate in the pebbly summit of the great Libyan desert. On one of these steps in 1902 members of the Geological Survey of Egypt made the important, in fact epoch-making, discovery of the ancient mammalian life of Africa, hitherto entirely unknown. In successive years the Survey and the British Museum sent parties to this desert and unearthed proofs of a rich and fertile country which existed perhaps two millions of years ago, long before the Nile valley rift was formed. In the tributary streams and rivers coarse and fine sands were deposited, containing the hones of the animals of the period. While the graves of the Pharaohs have heen sacked for the last five thousand years, nature has concealed this burial place until the twentieth century. This was the nursery of Africa's distinctive contribution to the mammalian life of the world, including so far as known at present the proboscidea, or elephants; the sirenia, or sea cows, manatees, and dugongs; the hyracoidea, or rock and tree conies, the zeuglodontia, or primitive whales. There were also the arsinoitheres, great quadrupeds which never journeyed beyond the confines of Africa.

The peculiar interest of the American Museum in this discovery lay in the fact that three of these great groups subsequently found their way over to North America, namely, the elephants, sirenians, and zeuglodonts. In American collections

they are richly represented by highly developed and specialized but ancestorless forms. It was obviously worth a long and expensive journey to bring home these extremely ancient Egyptian ancestors and thus trace these animals back to their beginnings in the Eocene period, when they were of small size. Prof. H. F. Osborn formed the plan and President Morris K. Jesup generously contributed the chief expenses of the expedition.

The party, including Professor Osborn and two assistants, Walter Granger and George Olsen, both well trained in Rocky Mountain exploration, left New York on January 5, and reached Cairo on January 23. Liberally assisted by the Egyptian Geological Survey, the large camel caravan was ready to start on January 29th, fully equipped with tents, tools, and especially with the *fantasses*, or water tanks. An indirect route was chosen southward along the edge of the desert and past the pyramids, to observe the excavations which are being conducted on such a vast scale, and the methods of Egyptian labor. At a point about thirty miles due south of Cairo and the great pyramids of Giza, the party, which now included Hartley I. Ferrar, formerly geologist of the British Antarctic expedition, stopped for a day near the Pyramids of Lisht. Here they were entertained by Dr. A. M. Lythgow, who is just beginning at this point his excavations in the interests of the Metropolitan Museum of Art. Dr. Lythgow, who has had a long training in Egyptian excavation, is fitting up his quarters in a simple and inexpensive but thoroughly scientific manner, in preparation for a long campaign, similar to that which Dr. Reissner, another American, is so ably conducting around the Giza pyramids. The route now lay northwest to the northern border of the Fayûm oasis. The nearest exposures were reached on February 5, exactly one month after leaving New York. In plain view were the lines of previous excavation, formerly reserved by the Egyptian Survey, but now hospitably released for our excavations.

Here a permanent camp was made, overlooking the ruins of the ancient city of Dimeh, eight miles to the south, with Birket el Kurûn beyond. The waters of this lake are unfit for either men or animals, and after exhausting some temporary rain pools, which soon evaporated, the party was dependent upon a water supply carried on a three or four-day journey by camel. Thus the water caravans were constantly moving forward and backward. At first there was difficulty in getting competent laborers; but Dr. J. E. Quibell, who is in charge of the field explorations of the Cairo Museum and every season is employing a large number of men who come down the Nile from Kuft, near Luxor, kindly volunteered to lend us twelve of his skilled excavators. These natives are in demand all along the river because they have received training from boyhood under Dr. W. Flinders Petrie, and especially in recent years under Dr. Reissner, who is famous as a disciplinarian. The swarthy men and boys of Kuft passed from archæology to palæontology in the most natural manner, and after two days' instruction treated the fragile remains of the diminutive ancestral elephant with as great tenderness as if they were handling a mummified king or a delicate roll of papyrus.

While Mr. Granger and Mr. Olsen were educating the force of seventeen natives in the refined methods of work which are absolutely essential to success, Professor Osborn, accompanied by Mr. Ferrar, made a thorough reconnaissance of the whole fossil field, a distance east and west of about forty-five miles, in order to determine the scope of the work and to decide upon what level to make the principal attack. After ten days of continuous search in the quarries first opened, it became evident that the expedition would be successful not only in bringing back perfect remains of the animals already known, but in adding to this ancient life of Egypt a number of animals hitherto unknown and undiscovered.

The Museum camp is now equipped for the months of March and April and as much of May as the temperature will permit, with a water caravan of eight camels, and a force of twenty excavators who will gain in efficiency every day. As the boxes are filled they will be transported directly by "ships of the desert" to Giza, a distance of forty-five miles. In the Survey buildings they will be repacked for the still more severe jolting of the journey to New York. In about a year from now we may expect to see the remote and diminutive African ancestors of the elephants placed beside their towering American offspring in the halls of our Museum.

H. F. O.

Anthropophyteia: Jahrbücher für Folkloristische Erhebungen und Forschungen zur Entwicklunggeschichte der geschlechtlichen Moral. Von Friedrich S. Krauss. III. Band; 449 plates. Leipzig: Deutsche Verlagsactiengesellschaft; privately printed in numbered copies.

Der Volksmund: Alte und neue Beiträge zur Volksforschung, herausgegeben von Dr. Friedrich S. Krauss. Leipzig: Deutsche Verlagsactiengesellschaft.

The third volume of "Anthropophyteia," the great work on sexual folklore, just issued, is edited by Dr. Friedrich S. Krauss of Vienna, the distinguished South Slavic ethnologist; and among the collaborators are such specialists as Achelis, Bloch, Herrmann of Budapest, Pitré, Robinsohn, the late Dr. Obst of Leipzig, and our own Dr. Boas of New York. The edition is limited, for the use of students only. In this most important, and yet most difficult and repellent, department of ethnologic investigation the purpose of the work is to cover the whole field, but with more special attention to Europe, particularly the Balkan peninsula, for which Dr. Krauss is himself our best authority. The scope of inquiry ranges from primitive anthropology to modern—and decadent—civilization, through myth, ritual, song, story, and proverb. Among the special topics treated, concerning which it is obviously impossible to particularize, may be noted phallic survivals, supernatural conception, betrothal and marriage customs, sexual hospitality, the *jus primæ noctis*, erotic dances, erotic tattooing, puberty, pregnancy, and childbirth customs and beliefs, love charms, and proverbs. Previous volumes have treated of South Germany, Italy, Sicily, Hungary, the Gypsies, and the Balkan provinces. The present volume deals chiefly with Elsass, upper Austria, Servia, and the Magyars. The illustrative texts are given in Magyar, Servian, and German, frequently in dialectic forms, with accompanying glossaries, rendering the work of great value to the philologist as well as to the ethnologist.

To the student of civilization the work is a revelation. Many of the myths and customs recorded as still existing, particularly in the Balkan States, have unquestionably come down from remote pre-Christian antiquity, and many others, as ancient in origin and crude in manifestation, are but recently extinct. Indeed, the pervading bestiality of daily life and thought throughout whole provinces of southeastern Europe must be a subject of deep concern to all interested in the uplifting of the race.

In the Volksmund series which Dr. Krauss is editing, of which six booklets have already been issued, we have one of the most interesting collections of South German folk literature which have appeared in many years. Two of the five volumes consist of dialect songs gathered in the mountain region of upper Austria by Schottky, Ziska, Blümml, and Krauss himself, with the music of the most characteristic, and an ample glossary of the dialectic forms. They cover the whole range of cradle songs, child songs, festival songs, comic, hunting, and love songs, together with a number of the peculiar dance verses known as *Schnaderhüpfel*, and supposed to be fragments of ancient rituals. Two others of the series consist of comic tales of the "road shortener" (*Wegkürzer*) order, by Montanus and Frey, sixteenth century writers. Both have the coarseness of the period, but Frey is of somewhat higher literary standard. Number four of the series is a reëditing of Ziska's Austrian folk tales from the Schneeberg mountains, first published in 1822, together with a number of songs and song games, greetings, prayer formulas, etc., from the same region, all in the local dialect, with explanatory introduction and glossary, by Wurth and Blümml. The sixth volume, "Gypsy Humor," by Krauss himself, is a collection of jokes, anecdotes, and folklore tales illustrative of the simple wit and happy improvidence of the Austrian Gypsies, under whose tents the doctor in earlier years spent many an evening.

The first step has recently been taken in actually proving what species of jungle fowl formed the ancestor of our domestic poultry. Darwin and most other naturalists since his time have taken it for granted that it was the Red Jungle Fowl (*Gallus gallus*), but the Ceylon bird (*G. stanleyii*) has had many supporters. The Ceylon Poultry Club has just published in "Spolia Zeylonica" an account of efforts to hybridize the wild jungle fowl and the domestic birds. After many unsuccessful attempts it was found impossible to obtain fertile eggs when a domestic cock was mated with a jungle female, but from a wild cock and domestic hen numerous hybrids of both sexes were hatched. Finally—and this is the crucial point of the whole experiment—the mating of two of these hybrids gave negative results, as was also the case when a hybrid female was mated back with a wild cock. From these important experiments we may infer that it is improbable that the Ceylon Jungle Fowl has had any direct part

in the establishment of our various races of domestic fowls.

The report of work accomplished at the Solar Physics Observatory, South Kensington, to December 31, 1906, is now sent out by Sir Norman Lockyer. It embraces an account of laboratory work, and of observations of sun-spot spectra; a summary of results at the Maharajah Takhtasinghl Observatory at Poona and at Kodaikanal; and of night-work at South Kensington. Sun photographs have been made with the photoheliograph at Dehra Dûn, and others at Mauritius, both of which are here reported. The spectroheliograph has been in use daily, and there has been an interchange of results between South Kensington and Kodaikanal. The staff of the observatory, which includes Dr. W. J. S. Lockyer, and several assistants, has been busy throughout the year in preparing and publishing numerous papers on a great variety of astrophysical subjects.

The Eleventh International Anti-Alcoholic Congress will convene in Stockholm July 28 to August 3. The preliminary programme includes the discussion of technical papers on all the leading problems of alcoholism, and a number of general meetings in which the subjects will be discussed in a popular way.

Pierre Eugène Marcellin Berthelot, the distinguished French professor of chemistry, died Monday in Paris. He was born in Paris in 1827, and educated at the Collège Henri IV. When only four years old he was a pupil of Renan, with whom his friendship lasted until Renan's death. In 1860, Berthelot entered upon his scientific career as professor of organic chemistry at the École de Pharmacie, and in 1865 a chair of chemistry was established for him in the Collège de France. His connection with this institution lasted until his death. He became a member of the Institute in 1873, and in 1889 he was made life secretary of the Academy of Sciences. He was one of the pioneers of organic synthesis, and his work in the determination of the carbon groups was one of the largest contributions to chemical science that had been made in the last fifty years. Among his discoveries were acetylene gas and smokeless powder. The science of thermo-chemistry is largely built upon his initial experiments. In addition to his scientific interests, Berthelot took some part in national politics. He was Minister of Public Instruction from 1886-1887, and Minister of Foreign Affairs in the Bourgeois Cabinet from 1895 to 1896. He was a member of the Legion of Honor, and of various French and foreign literary and scientific societies. Among his many published works may be mentioned the following: "Chimie organique fondée sur la synthèse," 1860; "Leçons sur les méthodes générales de synthèse," 1864; "La force de la poudre et des matières explosives," 1871; "Essai de méchanique chimique fondée sur la thermo-chimie," 1879; "Science et philosophie," 1886; "Introduction à l'étude de la chimie des Anciens et du Moyen-âge," 1889; "Correspondance avec Renan," 1898; "Chimie végétale et agricole," 1889. It was said of Berthelot that, like Renan and Pasteur, the man in him transcended the scientist, and made him as beloved as he was eminent. His jubilee, celebrated at the Sorbonne, was an occasion of national interest; and the Chamber of Deputies has voted him a national funeral.

Dr. Mathias Marie Duval, Professor of Histology at the Paris Faculté de Médicine and at the École d'Anthropologie, has just died in his sixty-third year. He wrote on the use of the microscope in diagnosis. One of his best-known books is "Le Darwinisme," 1885.

John Hill Brinton, a surgeon of international reputation, died on Sunday at Philadelphia. Dr. Brinton was born in 1832. After acting as medical director with Grant of the Army of the Tennessee, in the civil war, he was assigned as surgeon-general at Washington, and prepared under orders "The Surgical History of the Rebellion." He founded the Army Medical Museum; he was one of the chief surgeons of the Jefferson Hospital and College; and he was founder of the Pathological Society of Philadelphia.

Drama.

ERMETE NOVELLI.

The engagement of the famous Italian actor, Ermete Novelli, began brilliantly in the Lyric Theatre on Monday evening, when the house was crowded by his enthusiastic compatriots. "Papa Lebonnard," an adaptation of a French play by Jean Aicard, in which Novelli elected to make his first appearance, is not a particularly agreeable or convincing story, but it does provide him with an attractive part, in which humor, passion, and pathos are skilfully blended. It was written originally for the elder Coquelin, who was only moderately successful in it, doubtless because the note of sincerity is lacking in both his pathos and his passion. Lebonnard is an affectionate old fellow, a rich retired clockmaker, who still plies his trade in private and cares nothing for society, its ways or its rewards. He wishes his daughter, Jeanne, to marry the young physician whom she loves, but her mother and brother Robert are ambitious and insist upon her accepting a marquis whom she despises. The theme is Bœotian in its simplicity and antiquity. The doctor confesses that he is an illegitimate son, a fact to which Lebonnard and Jeanne are quite indifferent; but Mme. Lebonnard and her son are furious, and the former assails her husband so vehemently that he, mild man as he is, turns upon her, accuses her of prolonged infidelity, and avows the knowledge that their supposed son is none of his. In his rage the old man takes his wife by the throat just as her son enters the room. The boy angrily denounces his reputed father, who, thereupon, in a frenzy of rage, proclaims him a bastard. It is inconceivable that Lebonnard should have kept such a secret so long, but the crisis, from the point of view of the theatre, is a valuable one, and it is interpreted by Signor Novelli and his company with a vivid realism that creates great enthusiasm. After this climax the last act, devoted to scenes of reconciliation, falls rather flat.

Signor Novelli impersonated the old bourgeois clockmaker to the life. His dress, his carriage, his deprecatory smiling manner, his brief moments of rebellion, his confidential tenderness with his daughter, his chuckling humor, all contributed to the perfection of a delightful character study, finished with admirable neatness and great fulness of detail. The picture, perhaps, suffered a little from elaboration of detail. Signor Novelli has a wonderfully mobile face, over which he has absolute control. He appears to find great pleasure in exhibiting its transformations, which sometimes exceed the modesty of nature. But undoubtedly his free facial play is a great illumination of his acting. He led up to his final burst of passion with great skill, marking each accession of wrath, until all the pent-up energy broke forth in a flood. It was a fine exhibition of reckless anger, but was distinctly melodramatic, not tragic. The pathos of his reconciliation scene was chiefly upon the surface. The physical denotements of intense grief were all presented with great accuracy, but there was more suggestion of art than abandonment in the sorrow, although he drew copious tributes of tears.

On Tuesday evening Signor Novelli appeared as King Lear, presenting the tragedy in an arrangement of seven acts, each act constituting a scene. By this means some time in representation is saved at the cost of intelligibility. But the outlines of the original are fairly well preserved, though the text, as might be supposed, undergoes some strange transformations. It is often quite impossible, of course, even to suggest the spirit of the Shakespearean vernacular in Italian. On this account the free cutting of the text is, perhaps, rather a cause for congratulation than otherwise. Less of it is spoiled. Manifestly it would be absurd to judge Signor Novelli's impersonation of the old king by the best traditions of the English-speaking stage. As a matter of fact, it is in the earlier acts as un-English, and as un-Shakespearean, as could easily be imagined. Something of the same sort, but with less justice, was said of Salvini's Lear, but the latter—whether by inspiration or special study does not much matter—was infinitely nearer to the accepted ideal of the part. It possessed a certain natural majesty, the repose of assured authority, which made the subsequent ruin all the more pathetic. Moreover, it was cast in a more heroic mould, was inspired by grander passion, and torn by more profound emotions. Salvini's Lear was stately, even in abject misery, and all the more profoundly pitiful. Novelli's is melodramatic, hysterical, picturesque, and, at times, wonderfully human, but it is not in the highest sense tragic. Its multiplicity of pose, its innumerable and rapid transitions, its profuse gesticulation, its studied effects, in a word, its intense theatricality, stamp it irrevocably as a work of great cleverness, but not of genius. Wholly apart from its manifold errors of conception, it exhibits neither the tragic fury nor the melting pathos of Edwin Booth's Lear. Nevertheless, it has many fine moments, especially in the mad scenes, which are full of ingenious and illuminative interpretation, and are executed with superb technical skill. If Signor Novelli were less clever he would be more convincing. Even the effect of the famous curse upon Goneril, which he delivers

with fiery vehemence, is marred by too elaborate stage business. On the whole, his Lear is a disappointment. It remains to be seen what he can do with Othello.

John Raphael is making the English version of "Les Bouffons," in which Maude Adams is to play in New York the part which Sarah Bernhardt acted in Paris.

Music.

The Violin. By Abele and Niederheitmann. Translated from the German by John Broadhouse. Imported by Charles Scribner's Sons, New York. 75 cents net.

The history of woman's dress hardly shows a greater variety of shapes, not a few of them barbarous or grotesque, than the history of the violin. But while dress is still in a perpetual state of change, the violin long ago reached the final stage in its evolution. Every minute detail in its shape and structure has its reason for being, and the slightest deviation from the curvature of the sides or the back, or belly, or change in the shape of the *f*-holes, affects the nature of the vibrations and results in deterioration. It makes a world of difference, too, what sorts of wood are used. Some years ago the French expert in acoustics, Savart, sought to discover the great secret of violin making by a series of experiments. He changed the details of shape, tried every conceivable kind of wood, as well as silver, copper, and brass, but finally concluded that the violin model left us by the old Italians is the best that has been or is ever likely to be found.

In this little book on the violin, which has been excellently translated, interesting details are given regarding Savart's experiments and the practices of the old Italian masters, whose unerring instinct thus led them, as far back as the sixteenth and seventeenth centuries, to create perfect violins at a time when most of the other instruments used in our homes and concert halls were still in their infancy. The skill of the masters of the Cremona school amounted to positive genius. It is not merely the varnish, or the length of time which the instruments have been in use, that account for the superiority of the Cremona violins; the varnish has been chemically reproduced, and there is a first-class Stradivarius which for more than a century no bow has touched. There was an acoustic instinct that guided the builders, and if Stradivarius surpassed all the others this is due in large part to his infinite capacity for taking pains; he always "wrought out the minutest detail with the greatest possible perfection." The differences in construction and tone in the instruments of all the most famous makers are concisely and reliably indicated in the current volume, and there are also biographic details. In the introductory section the authors sketch the history of the violin; they trace it to the rebek of the Arabians, rejecting the theory that the crouth had an effect on the construction of the violin. Documentary reference to the violin's predecessors is surprisingly scarce before the sixteenth century. This lack the authors plausibly attribute to the fact that before that date the *Spielleute*, or players upon instruments (the organ excepted), were for the most part of the despised class of minstrels, of whom dignified writers were not expected to take serious notice.

Oscar Hammerstein began his first opera season at the Manhattan with casts strong in men but weak in women singers. He did not prosper until Nellie Melba joined his forces. She makes her last appearance on March 25, and two days later Emma Calvé will be heard at the Manhattan in "Carmen," which has already been sung there fourteen times since December. For next season Hammerstein has a formidable array of singers—Melba, Calvé, Nordica, Schumann-Heink, Bressler-Gianoli, Trentini, De Cisneros, and Giaconia; and, among the men, Bonci, Bassi, Renaud, Dalmores, Sammarco, Ancona, Gilibert, and Arimondi. He ought to have a stronger bass: Edouard de Reszke, for example. The scope of the Hammerstein performances is to be greatly enlarged. Whereas he limited himself this season to the more popular Italian and French operas, with a few revivals of former favorites, he is to have, next winter, genuine German opera and French opéra comique. Four or five of Wagner's operas are to be under Campanini, an excellent interpreter of that master's works—which it will be of special interest to hear under the favorable acoustic conditions of the Manhattan. Of equal interest will be the transplanting to American soil of some of the artists and the operas of the modern French opéra comique. Among the most successful of these operas in Paris are Charpentier's "Louise," Debussy's "Pelléas et Mélisande," and "Aphrodité." How they will be received here remains to be seen. M. Perier and Mary Garden have been engaged. The Hammerstein season is to begin on November 4 and last twenty weeks.

Heinrich Conried has not yet announced his principals and plans for next year at the Metropolitan, but he will have Caruso and nearly all the leading artists in this year's company. Indeed, it is intimated that not only will the Metropolitan season be extended by three weeks, but there will be subscription performances on Thursdays, as well as on Mondays, Wednesdays, Fridays, and Saturdays. Several works are to be added to the Italian repertory, and there is to be a complete cycle of Wagner's operas, from "Rienzi" to "Parsifal." Fears have been expressed of an operatic surfeit, but the present indications are that New York's appetite for music is insatiable. The climax and finale of the Metropolitan season is the Nibelung cycle, which began on Tuesday, and ends next week, to be followed, on Good Friday, by "Parsifal."

The Mozart and Wagner festivals are to be repeated this year at the Prince Regent Theatre, in Munich, from August 1 until September 14. There will be six Mozart and twenty Wagner performances. "Don Juan" will be given on August 1 and 7; the "Marriage of Figaro" on August 3 and 9, and "Cosi fan tutte" on August 5 and 11. The Wagner performances will be given on the following days: "Tristan and Isolde" on August 12, 21, 26, and on September 7; the first performance of the "Ring" August 14, 15, 17, and 19; "Tannhäuser" August 23, September 4; "Meistersinger" August 24, September 5; second performance of the "Ring" August 28, 29, 31, and September 2; the third performance of the "Ring" September 9, 10, 12, and 14.

Maurice Grau, predecessor of Heinrich Conried as manager of the Metropolitan Opera House, died in Paris last Thursday. Born at Brünn, Austria, in 1849, he was brought to New York at the age of five by his parents. He studied law, but interest in dramatic affairs created by association with his uncle, Jacob Grau, led him to abandon the law before being admitted to the Bar. For some years he remained in his uncle's employment in various capacities. In 1872 he began with an enterprise of his own, bringing Aimée to this country. The same year he managed Rubinstein and Wieniawski, who made a successful tour with the Thomas orchestra. In 1873 he formed the Clara Louise Kellogg English Opera Company. After various ventures, not always profitable, he formed a partnership with Abbey and Schoeffel, in May, 1882; and the projectors of the Metropolitan Opera House, in opposition to Col. J. H. Mapleson at the old Academy of Music, chose this firm to manage the enterprise. The season of 1883-84 was the first in which the rival companies were pitted against each other. This plunge into grand opera was a disastrous experiment for Abbey, Schoeffel & Grau. They lost $250,000 and returned to theatrical management. At last in May, 1897, the Maurice Grau Opera Company was organized. From that time Mr. Grau managed the affairs of the Metropolitan with increasing success until the spring of 1903, when ill health compelled him to retire, and Mr. Conried was chosen as his successor. Mr. Grau's most notable achievements were the introduction of star casts and of the custom of having each opera sung in the language in which it was written. Before him "star opera" meant one star and several mediocrities; under him it meant a cast including three, four, or five world-famed singers. He was for years strongly prejudiced against Wagner and German opera. Walter Damrosch, shrewd enough to take advantage of his folly, gave a season of Wagner opera, which was so successful that Mr. Grau's eyes were opened, and thenceforth he bestowed the same careful attention on German as on Italian and French opera.

Fritz Scheel, conductor of the Philadelphia Orchestra, died at Philadelphia March 13. He was born at Lubeck, Germany, in 1852. His father and grandfather had directed small orchestras in and near his native place, and thus from early childhood he was familiar with the instruments of the orchestra. His special study was the violin, but he learned also to play the horn, trumpet, trombone, and tuba. After he had conducted concerts at Chemnitz, Hamburg, and other places in Germany, he began his American career as conductor of the Trocadero concerts, at the Columbian Exposition. From Chicago he went to San Francisco, eventually becoming conductor of the local Symphony Society. In 1900 he settled permanently in Philadelphia. Later he organized the Philadelphia Orchestra Association, and was its conductor until a few weeks before his death.

Art.

The Life, Letters, and Work of Frederic Leighton. By Mrs. Russell Barrington. 2 vols. New York: The Macmillan Co. $10.50 net.

Although this profusely illustrated book, in two great volumes, may fairly be called "sumptuous," it cannot be called a worthy monument to its subject. Its author has little critical acumen or severity of taste; it is rambling and repetitious; padded with much matter of little interest as presented; marred by mistranslations of foreign tongues, misunderstanding of technical terms, faulty transcription of proper names, and careless proofreading. On so important a matter as the technical method of painting deliberately adopted, after many experiments, by Leigbton and his friend, Giovanni Costa, it is quite unintelligible. Of the kind of errors that abound in it, one specimen shall suffice. Tbe name of the painter Couture occurs several times, and is spelt Conture, in botb text and index, except in one instance. That one instnce is entered in the table of errata to tbe first volume, "*for* 'Couture' *read*, 'Conture.'" Nevertheless, the book affords sufficient information about a brilliant and important figure in nineteenth-century painting, and a sufficient number of good reproductions of his works, tc make it a welcome addition to the library of the student of art.

Probably no other painter, since the art of painting was invented, ever received such splendid material rewards for the exercise of his talents as did Frederic Leighton, Baron Leighton of Stretton, president of the Royal Academy, commander of tbe Legion of Honor, associate of the Institute of France, member of most of tbe academies of Europe, doctor of this or that in half-a-dozen universities, knight of many orders, man of wealth, friend of princes—a person of distinction and the highest social standing wherever he might find himself. Perhaps it is partly for this very reason that many critics and painters are inclined to deny him those less material rewards of permanent fame and abiding influence wbich they would bestow on some less successful men. The very qualities which so greatly aided his career—his good looks, bis accomplishments, his personal cbarm—have tended to obscure his real artistic talent. He did so many things so well that people might be excused for forgetting that he "painted too," as Whistler phrased it—whether as a sneer at tbe artist or as a rebuke of his superficial admirers, it is difficult to say. He was so eminently and obviously tbe proper person for the head of an academy that his art is dubbed "merely academic" and safely disposed of.

How early he was marked out for bis great office is surprising. As a youngster at Rome, before his first picture had been exbibited, Thackeray met him, and at once set bim down as Millais's only serious rival. Later, in London, before and at tbe time of his election as associate, bis future destiny seems to have been a matter of common talk. It was impossible not to recognize the fitness of the only Englishman who ever really knew how to draw the human figure, when that Englishman was also a cultivated gentleman, a linguist, a musician, an effective writer and speaker, an extremely handsome man, and a person of winning manners. Better than all these things, he was a man of pure and lofty character, not only honorable and conscientious, but broad-minded and tender-hearted, full of charity and the milk of human kindness, an ornament to any profession and to any walk in life.

Born at Scarborough in 1830, of a good family, the son of a physician who had given up practice and lived tbe life of a scholar, Leighton was educated abroad, being little in England from the time be was ten years old until he settled in London in 1859. All his life he remained a traveller, and was almost as often in Italy as at bome. His father wisely insisted on bis attaining a good classical and general education before devoting himself to art, and though be seems to have begun his serious artistic training in Florence in 1842 and to have become tbe pupil of Steinle of Frankfort in 1843, it was not until be was seventeen that be was allowed to give bis whole time to his future profession. He remained with Steinle, or under his direct influence, until 1852, and he always referred to that influence as having set upon his own art "the ineffaceable seal." Steinle was an offshoot of the German Nazarenes, an admirer and, in some sense, a follower of Cornelius and Overbeck; but his own classicism seems to have been of a mucb less pompous and artificial sort tban theirs. His was a pure and gentle spirit, and he filled his pupil with lofty ideals of devotion to the highest in art. Technically, his chief insistence must have been upon absolute perfection of drawing. Any specifically German accent tbat Leigbton may have acquired from him rapidly disappeared wben his immcdiate influence was removed; but to him tbe young man undoubtedly owed that thorougbness of education in form which made him a unique figure in England and the equal of the best-trained artists anywbere.

In 1852 he went to Rome, and the next year or two he devoted to tbe painting of his first important picture, Cimabue's Madonna Carried in Procession througb the Streets of Florence, which was exbibited in the Royal Academy in 1855, a more ambitious work in size and in the number of figures it contained than any otber work of bis except Tbe Daphnephoria of 1876. It met with instantaneous success, was praised by artists and critics, and bougbt by the Queen. The opponents of Preraphaelitism were delighted to find a young man not of the Brotherhood who was the equal of Hunt and Millais in ability, while the mediævalism of subject and carefulness of detail evinced in tbe picture pleased tbe Preraphaelites and their great advocate, Ruskin. The success was too great to be at once repeated, and for some years we bear of pictures rejected or badly hung and of adverse comments in tbe press. Probably the pictures were not so good as the Cimabue—some of them have never reappeared—they were transitional works in which the real Frederic Leighton was disengaging himself from the pupil of Steinle. The mediævalism went first—tbe very year after Cimabue he painted a Pan, a Venus, and an Orpbeus; though in a freakish spirit, inconceivable a little later, he gives his Orpbeus a violin instead of a lyre. The whole transition can have taken but a short time, and from the early sixties to bis death he is always essentially the same. He was elected an associate in 1864 and an Academician in 1869, made president of the Academy and knighted in 1878, promoted to a baronetcy in 1886, and to the peerage on January 1, 1896, less than a month before his death.

Whether the art of Leigbton is rigbtly to be called academic depends, of course, on the meaning one attaches to that term. Nowadays it bas become a handy missile for tbe half-educated, the raw emotionalist, or the delighter in paint for paint's sake, to fling at all balanced, restrained, or accomplished art, from Raphael to Ver Meer of Delft. Because certain things must be learned, it is assumed that anybody may learn them; because a work of art shows training, it is assumed tbat tbere was nothing there to train; the possession of taste is treated as proof of the absence of talent. We sball yet hear Whistler called academic by the more extravagant of the modern advocates of slap-dash. In the sense that his art was studied, polished, restrained, always governed by taste and always avoiding excesses; in the sense that it showed the good breeding of a gentleman and the learning of a scholar, not to be acquired in a week or two, Leighton was certainly academic. Indeed, it may be doubted if any of his contemporaries but Paul Baudry was his equal in academic accomplishment. But it does not follow that he was nothing else, and that there was no real emotion behind his measured utterance.

Even of such truly academic painters as Cabanel or Bouguereau it is absurd to suppose that their work is the result of mere training. Hundreds of men had the same training without the intelligence and the gifts of eye and hand which enabled them to profit by it. Drawing is no more to be learned without an eye for form than is music without an ear for tone, and great natural gifts are as necessary as industry to tbe attainment of even respectable mastery in it. But Leighton's drawing, at its best, bas a quality entirely distinct from the cold perfection of Bouguereau's or the photographic accuracy of Gérôme's. Tbere are many evidences in the English painter's letters tbat he was keenly sensitive to beauty and was greatly moved by it, but such evidences are not to be found in the letters alone—his paintings and drawings are full of them. His early drawings of foliage and flowers are delightful, and in bis later work he attained to an ideal beauty in the representation of the human figure whicb is more nearly Greek than anytbing else in nineteenth century art. His few works in sculpture have been rated very high by professional sculptors, but let us ratber consider a few of tbe figures he painted. Look at the massive, the truly monumental, dignity of his Clytemnestra, as she watches from the battlements of Argos for the beacon fires which shall announce the return of her husband; a grand figure, titanic in bulk but nobly severe in line, a very embodiment of the spirit of antique tragedy. Look at the full-blown, gracious ripeness, languorous and heavy, of those two lovely sleepers in Tbe Summer Moon. Look at the youtbful suppleness of

the Antique Juggling Girl, her clean, round limbs as smoothly modelled as a Pompeian bronze; or at the exquisite, delicate slenderness of the Psyche, her flower-like body gleaming between the marble columns and reflected in the limpid element below. The creator of such figures as these, and of many others only less beautiful, is a great artist—an artist of power, of sensitiveness, and of style.

And note that it makes very little difference what these figures are called. Leighton has been accused, among other things of being a "literary painter," and of serving up to the British public its beloved anecdote slightly disguised with a Greek sauce. The accusation might not seem very terrible even if it were true—since Michelangelo and Rembrandt might tell stories without derogation, why not a lesser man? The question, after all, is not whether one tells stories but how one tells them. But, at least in the pictures just mentioned, the accusation is not true. Only one of these figures, the Clytemnestra, has any definite story connected with it, and one imagines that even there the figure may easily have been invented first and the story fitted to it afterward. The stately amplitude of the erect form, the tenseness of the rigid arms and clutched hands, the columnar effect of the whole, accented by and contrasted with the ripple and flow of the finely divided draperies—these are the things that count. Call her after any other tragic heroine and the result would be the same. The others are even more frankly renderings of a type and an attitude of the human figure, two women sleeping, a girl juggling with balls, a young woman disrobing for the bath. Of this sort are Summer Slumber, Flaming June, Clytie, and most emphatically of this sort are his essays in sculpture, The Athlete Struggling with a Python, the Sluggard, the Needless Alarms. All these are as purely artistic in inspiration, as little dependent on anything external to themselves for their effect, as any "symphony" or "arrangement" of Whistler's.

It might be more reasonably objected to these works that their inspiration is rather sculptural than pictorial, but there are still people in the world who will not consent that sculpture shall have the monopoly of beautiful form, or that the art of painting shall be robbed of half her immemorial domain, because its borders touch upon the confines of her sister's estate. And if the figures themselves might have been executed in marble or bronze, losing little thereby, there is in almost every case an arrangement of background and accessory, a use of landscape, an addition of light and shade and an enhancement by color, which are purely pictorial. No, the best of Leighton's works may fairly be called masterpieces of the painter's art, and their creator a master.

If he is not so successful in his larger and more ambitious works it is not because they tell a story or depict an incident, but because he was not a master of composition, and is seldom quite felicitous in his arrangement of more than one or two figures. Some of the pictures which most clearly show his besetting faults have no more subject than the Juggling Girl; the Greek Girls Picking up Shells by the Seashore, for example. Here each of the figures is the study of a movement, each is beautifully and interestingly arranged, but there is no bond of union between them, no grouping, no large and general sweep of line or apportionment of space. Their juxtaposition is so accidental and each exists so entirely for itself that one regrets that a slight overlapping here and there prevents the picture being cut into four, any one of which would be more effective than the whole. One could then enjoy the beauty of the individual figures without being irritated by their lack of coördination. Not all Leighton's major compositions are as ill put together as this—the Heracles Struggling with Death for the Body of Alcestis, for instance, is even extremely well put together—but they are *put together*. The whole scheme has not been *seen*, in its entirety, and the details developed from it—rather the separately seen details have been played about until a not unpleasing arrangement is achieved. The difference is radical. One does not expect the visionary lucidity, the astounding clairvoyance, of a Rembrandt—that is something altogether exceptional and to be thankfully received as such—but no man is a composer who has not something of that grasp of an ensemble which mark Raphael and Veronese, which Baudry had, and Millet, and many another and smaller man, and of this Leighton had very little.

It was perhaps his limited sense of composition, his lack of feeling for large guiding lines and simple masses, more than his method of work, which was responsible for another of his faults strongly exemplified in the Girls Picking up Shells. In that picture, as in the Greek Girls Playing at Ball, the draperies are supposed to be violently agitated by the wind, but they do not really fly—they are meticulously arranged in a myriad little folds that the wind would blow out of them in a moment, and their unsupported position is only to be accounted for on the supposition that they are of some rigid material like crumpled tin. The fault might be considered as merely the result of a lack of feeling for motion, were it not for two considerations: first, that the illusion of motion in art is entirely dependent on composition of line; and second, that Leighton's love for detail carries him into the same fault in the treatment of drapery in repose. In the best of his figures the many beautiful details of much divided drapery are yet duly subordinated to the total effect, but in other instances, as in the Fatidica, where the immobility of extreme dejection was to be depicted, this insistence on little things degenerates into an irritating wriggle of folds, which is almost entirely destructive of the effect aimed at.

Of Leighton's treatment of color it is more difficult to speak justly from an inspection of reproductions and the fading memories of originals seen long ago. Leighton himself, who was pretty well aware of his own strength and weakness, thought he had achieved his position as a draughtsman, "in spite of a fanatic preference for color." Yet the impression remains that he showed rather a fastidious choice and arrangement of beautiful colors than a true colorist's power, that his flesh painting was a bit waxy, and that he was too apt to harmonize his canvases by a general reddish tone, not altogether pleasant. Such as his coloring was, it was a distinct and necessary element of his work, not an after-thought, and he is far from those painters whose work is better in black and white reproduction than in the original. With Cabanel or Lefebvre the color is nugatory; with Gérôme it is an offence. With Leighton it is an essential part of the conception, and, often, a great addition to our pleasure.

It is given to few artists, however sincere, altogether to avoid the pot-boiler—the work done from routine, because work is expected from one and one's living is to be made—work conscientiously carried out and thoroughly craftsmanlike, perhaps, but into which the highest qualities of one's art hardly enter. It is work of this texture that most hurts an artist's reputation with the succeeding generation, and such work Lord Leighton, like others, produced. There are heads and figures of his which are excellently done in their way, but cold and smooth and characterless—things in which, whether by conscious concession to the popular taste or by a touch of national character in himself, his sense of beauty degenerates into a display of prettiness, doll-like and insipid. Is it necessary to dwell upon these? In the long run the best work of an artist gets itself sorted out, and upon that his reputation finally rests. If but a little of it is really excellent, the reputation is secure. To have created half a dozen beautiful and expressive figures is enough for any man, and Leighton has given us more than that number.

In the ceaseless flux of things, which we somewhat presumptuously call progress, one generation treads on the other's heels; and it is as natural that the young should sneer at their out-of-date elders as it is that these elders should be somewhat distrustful of the young until their ability is proved. The revolutionary of to-day is the obstructive of to-morrow, and has scarce done railing at his seniors before he is railed at in turn by his juniors. In our day the merry-go-round is moving briskly and a new "art of the future" is born every ten years or so. It may be that all new things are good, but do they cease to be good the moment something newer is in sight? Does a talent cease to exist the moment it is recognized, and does the putting of a letter or two after a name deprive the name itself of all significance? Let us by all means praise him who adds a field, however small, to the domain of art, but it is as well to keep a grip on the original acres. There are and will be, in spite of fashion, certain permanent elements of art, certain enduring forms of beauty, certain perennial sources of pleasure; and there are artists whose nature and whose duty it is rather to keep us in mind of these than to point out something else with much shouting. After all, are the new things always new and the young always infallible? David was as much a revolutionary in his day as the romanticists who tripped up his heels. Form is out of fashion, drawing is out of fashion, precision and delicacy of workmanship are out of fashion, and Leighton is out of fashion, too. The lover of beauty who has not to paint pictures or write criticisms does not much care and likes him as well as ever. As the whirligig goes round these things will come into fashion again, and then the critics will discover that Leighton, if not one of the world's great geniuses, was yet a true, a sincere, an

accomplished artist, and one who created certain forms of beauty and distinction worthy to endure.

The sixth annual exhibition of the Municipal Art Society is open at the National Art Society until March 31.

An exhibition of prints by American and foreign artists is now open in the print rooms of the Lenox Library.

Among the dealers' exhibitions in this city are drawings and paintings by the late Walter Appleton Clarke at Knoedler & Co.'s, till March 23 inclusive; paintings by the Ten American Painters at Montross's, April 6; etchings by Anders Zorn at Heppel & Co.'s, April 13.

The Greek minister of education has informed the authorities of the district of Pyrgos, in which are the Olympian ruins, that early in the spring Dr. W. Dörpfeld, director of the German Archæological Institute in Athens, will again dig near the Altis and on the Alpheios. It is confidently expected that the deposits left by the overflow of the river will contain a number of important finds.

A Belgian archæological expedition under the leadership of Dr. Jean Caparts, conservator of the Royal Museum of Arts in Brussels, has just started for Egypt to make researches on the probable site of the ancient Heliopolis, the sun city of the Pharaohs. The territory granted for this purpose by the Egyptian Government covers about 1,000 hectares. The Belgian Government has granted this expedition, in which the Louvain archæologist Dr. Mathieu, and Ferdinand Mayence, member of the French Archæological Institute, will take part, money for three years.

A collection of paintings belonging to Judge Samuel L. Bronson of New Haven, Julius O. Frank of Milwaukee, and Theodore Marburg of Baltimore was sold at auction in this city last Friday evening by the American Art Association. The highest price paid was $25,000 for Turner's Battle of the Nile. Among the other interesting prices are the following: Alma-Tadema, The Ruins, $3,600; Baths of Caracalla, $20,000; Millet, The Gleaners, $5,000; A. Schreyer, Advancing Foe, $2,400; The Raid, $6,050; F. Ziem, The Ducal Palace, $2,300; Charles Jacque, Approaching Storm, $3,600; Bouguereau, Magdalen, $2,300; Nut Gatherers, $2,000; Premiers Bijoux, $3,000; Ridgway Knight, Edge of the Garden, $2,000; Willem Maris, Landscape and Cattle, $2,100; The Harbor, $5,200; Josef Israëls, The Little Gossips, $3,800; Neuhuys, Afternoon Nap, $2,500; The Churner, $5,000; Happy Family, $3,000; The New Toy, $5,100; The Seedman, $2,600; Mauve, The Timber Truck, $8,000; Constable, Grain Field, $5,500; Hoppner, Portrait of a Lady, $2,600; J. Crome, Old Windmill, $5,100; Gainsborough, Landscape and Cattle, $4,100; ascribed to Titian, Toilette of Venus, $2,100; Sir T. Lawrence, The Star, $3,600; Beechy, Duchess of Buckingham, $5,700.

Edouard Toudouze, the painter, died last Friday. Born in Paris in 1848, he was a pupil of Pils and Leloir. He first exhibited in the Salon of 1867, and in 1871 was awarded the Grand Prize of Rome. After several years in Italy he returned to France, and continued to send annually to the Salon pictures on mythological subjects and ancient history, as well as some landscapes. He obtained a medal of the third class in 1878, one of the second class in 1877, a silver medal at the Exposition of 1889, and he was decorated with the Cross of the Legion of Honor in 1892.

The death is announced of Just Becquet, the sculptor, in his seventy-sixth year. Born in Bensançon, he studied under Rude, and became after 1853 a regular exhibitor at the Salon. Among his best-known works are Faune jouant avec une Panthère, in the museum at Tours, Saint Sébastien, Christen Croix, Sœur Marthe, and busts of Victor Cousin and Père Decoudray.

Finance.

RISE IN THE VALUE OF MONEY.

The continuous advance in prices of commodities, and the recurrent, spasmodic, and at times violent, rise in the price of stocks with a speculative value, have been no more symptomatic of present economic conditions than the fall of high-grade securities—notably bonds of nations and cities, whose credit is unimpeachable. Such a sharp decline has occurred in the past week. Typical among sound investments, the world over, are British consols. This bond is of so high a quality, and in the past has been in such demand by investors who want absolute security, that as lately as 1897, while paying only 2¾ per cent., subject to deduction of the heavy British income tax, it sold on the London Stock Exchange at 113⅞, a price yielding less than 2½ per cent. to the investor. A few days ago, consols sold down to 84 11-16—not only the lowest price since the Boer war broke out, but actually the lowest since 1848.

There has been a similar shrinkage of values elsewhere. New York city's bonds—equally unquestioned—which six years ago, while paying 3½ per cent., were sold at 110, have declined so continuously that, even with the interest rate advanced to 4 per cent., they were placed at little more than par, and to-day are quoted below. Since the city is permitted by law to pay no higher interest than 4 per cent., and to accept no lower price than par, it is confronted by a real embarrassment. This week, an offer of 4 per cent. bonds by the city of St. Louis failed to attract better bids than par. Philadelphia, offering last Monday $5,000,000 of its 3½ per cent bonds at par or higher, got no bid at all. Simultaneously, the price of high-grade railway bonds has been ebbing, even while shares of the same companies were rising rapidly on the Stock Exchange.

For this world-wide phenomenon, there have been local explanations: in the case of British consols, the Boer war issues and the reduction in the interest rate from 2¾ to 2½ per cent; in the case of cities, both in England and America, the extravagance of government and the profusion of new municipal issues. These influences are real, but they are only superficial. Economists and bankers of larger outlook find an explanation in the "rise in the value of money." This phrase, which is likely to become familiar hereafter in market diagnosis, is so striking, and yet so vague, that it calls for some careful examination. "Rise in the value of money" seems at first glance to conflict with the "depreciation of gold," lately explained in this column. "Money," however, in the phrase with which this article has to do, is not used in the sense of metallic currency, or even government paper. It means accumulated capital, wealth available on the market for investment or loans. When the existing supply of such surplus resources of a community is already tied up in active trade, in extensive building operations, in purchase of high-priced materials, in extravagant speculation, the bid for its use in industry must rise.

On the other hand, "rise in the value of money" is often confused with rise of the prevalent interest rate. This second condition is a frequent but not invariable accompaniment of the first. Value of money, as the phrase is here employed, rose decidedly during 1903; capital was extraordinarily difficult to procure for investment, and British consols, among all other high-grade securities, declined to what was then a "new low price" for the generation. Yet the rate for bank loans, here and abroad, ranged nearly all the year within normal figures. Four per cent. was the year's highest official rate at the Bank of England, and that was below the maximum of 1900 or 1901. Loans on time in the New York money market went during most of the year at a rate under 6 per cent.

The "rise in the value of money" was indicated, not through the bids of an overnight Stock Exchange borrower or a bidder for two months' loans, but through the

concessions offered in price of old or new securities. Instead of accepting 4 per cent. railway bonds at par or higher, holders of capital exacted 6 per cent. on three-year notes of the companies, and the price of outstanding high-grade securities generally adjusted itself to the new arrangement. Where, twelve months before, the net yield at ruling prices to investors in good securities had been less than 4 per cent., it was possible in the middle of 1903 to earn 5 per cent. or more. Value of money had advanced, and precisely the same symptoms, displayed in the same quarters, are visible to-day. Again the price of the highest grade of securities has fallen most rapidly. The reason is obvious: when thoroughly sound securities can be obtained at a price netting 5 or 6 per cent., capital not only will not flow freely into government stock yielding 2½ or 3 per cent., but will be actually withdrawn from that quarter.

It is, then, plain enough why the price of high-grade bonds should decline in the era of prosperity. The fruits of incorporated industry are so large that it is ready to bid a higher price for the capital needed to conduct it. That stocks should frequently advance, at the very moment when high-grade bonds were declining, involves no inconsistency. Such an advance in stocks, during a period of expanding prosperity and industrial profit, reflects either higher dividends actually paid by the companies, as a result of that prosperity, or else expectation of such dividends. This advantage the bond with a fixed rate of interest cannot share. Bonds of incorporated companies incur less danger of default in interest in good times than in bad; and this fact is to a certain extent reflected in higher prices. But to a rise on this basis there is a limit, and with bonds of a high-grade government, not even this argument will apply. The investment in them is safe in any case; but even such a government, entering the market later to borrow more, may have to bow to the higher value of money, and sell another instalment of the very same bonds at a lower price. This action would, of course, bring down the market value of the outstanding bonds.

If one asks, how all this process is to end, the answer is easy. It has always ended, and it always will, when the inevitable reaction of trade and industry occurs; when business profits are reduced, and when dividends on stocks, instead of advancing, are cut down. At such times, capital is in so much slighter request that it flows freely into markets where lower yield, through a cut in dividends, is not threatened. Prudent investors then prefer the position of bond-holding creditors, rather than of stock-holding partners in railways or other enterprises. And, since decrease in earnings, carried to extremes, may conceivably jeopardize not only dividends but interest on a debt, demand becomes urgent for securities where no doubt as to safety exists. This, again, explains why in 1896, perhaps the low ebb of trade activity and of commercial prices during the past two decades, British consols rose to their high-record price of 113⅞.

The "Proceedings of the Thirty-second Annual Convention of the American Bankers' Association, held at St. Louis, Mo., October 16, 17, 18, and 19, 1906," have been edited by James R. Branch, one of the secretaries of the Association, and handsomely printed. The volume contains also the constitution and by-laws, with lists of officers and members, and other pertinent matter.

LONGMANS, GREEN, & CO., New York

The Nation.

NEW YORK, THURSDAY, MARCH 28, 1907.

The Week.

No part of Mr. Bryce's speech at the Pilgrims' dinner in New York Saturday night was in finer spirit than that in which he rose above all the notions of competition and jealousies in international friendship. There has been something petty and almost sordid in the eager speculation as to which foreign country could send the most acceptable Ambassador here, and so show itself a *leetle* more our friend than any other. There was even talk that Mr. Bryce was chosen precisely in order to put Baron Sternburg's nose out of joint, or to take the *pas* from M. Jusserand. But none of these narrow and silly pretensions found any tolerance in the large discourse of the British Ambassador. He professed hearty friendship for the United States and desired our good will; nor did he fail to show that the two peoples have a civilizing mission in common; but he refused to make even the semblance of a bid for an exclusive place in our affection. The better our relations with other countries, the better England would be pleased, and the more hope she would have of strengthening her own bonds of amity with us. A truly humane and friendly spirit knows nothing of these limitations of kind feeling. It is as easy to have an *entente cordiale* with a dozen nations as with one. Of course, a country may be churlish and suspicious if it chooses, and keep foreigners as aloof as possible; but the genuine instinct of friendship is very much in a nation what it is in a man, and a friendly people will show itself friendly to all. Mr. Bryce put this truth with frankness and force in a way to leave us all in his debt.

Senator Foraker's blunt announcement that he will contest with Secretary Taft the endorsement for the Presidency by the Republicans of Ohio, gives a new turn to the campaign. Though it may merely bring into the open what was all along latent in the situation, its political effect must be great. If Taft has to fight for his own State, and if its Republican organization is clearly seen to be arrayed against him, he will find it difficult to go forth as a "favorite son" and seek delegates in other States. Mr. Cleveland was nominated in 1892, though the delegation from his own State was solidly against him, but that political miracle will hardly be repeated. Whether Senator Foraker seriously thinks of himself as a Presidential possibility, or whether he is simply determined to oppose a candidacy which Roosevelt favors, it is not now material to decide. The chief thing is that he means to take the field against Taft, and that, with Senator Dick and the whole Republican machine on his side, he intends to have an early State Convention and control it against the Secretary of War. This step at once puts the latter's candidacy into a critical condition. Secretary Taft's friends believe tbat he is a man fitted to appeal to the people on grounds broader than those of partisan tactics. That it is time for him to begin to do it energetically, Senator Foraker's sharp challenge shows beyond peradventure.

President James J. Hill of the Great Northern remarked in Chicago the other day that "too much has been said by railroad men already." This is not unlike Carlyle praising silence in forty-nine volumes. Few railway managers have spoken in public more frequently or at greater length than Mr. Hill. We hasten to add that what he has said has usually been well worth attention. In what may be called the statesmanship of railroads—that is, their large relations to the development of the country and the growth of commerce, both domestic and foreign—he has had an acknowledged eminence. And, of course, it is not talk by railway managers on such subjects that he would now discourage; but only the inconsiderate or reckless statements of which we have certainly had too many within the past few weeks. When men have been overtaken by the fated consequences of their own actions, the thing for them to do is to shoulder the responsibility of their folly, and not attempt to shift the blame to others. This is exactly the situation that confronts the leading railway officials of America to-day. They have been exposed as having too long been more anxious to manipulate stocks than to make the management of their roads efficient and honest. In the reaction of public sentiment which has followed, their properties have suffered, values have shrunk, and the confidence of the people received a severe shock. This being so, it is best for them to face the truth squarely. For them to cry out now about "hostile legislation" and "unreasoning popular suspicion," is only to make their plight the worse. Happily, we are beginning to get franker utterances from railroad men, able to see the point, and willing to speak to it. B. F. Yoakum of the Rock Island uttered an elementary but neglected truth when he said that it is as great a wrong for a railroad to be at the mercy of stock-jobbers as it would be for a savings bank or insurance company to be exposed to their looting. He would have speculation in the securities of a railway company by its own officials made subject to criminal prosecution. Mr. Hill is right in thinking that what the country now wants from railroad managers is not words so much as deeds. If they will make up their minds to obey the laws we already have, they need not live in dread of future legislation.

What is to be tbe next development in the Brownsville riot inquiry? The court-martial has acquitted Major Penrose of the charge of neglect of duty in permitting his soldiers to "shoot up" the town, but still finds that the soldiers did do the fusillading. According to this decision, a post commander's troops may commit what President Roosevelt declares to be the most heinous crime in the history of the army, without any culpability attaching to the commander. This doctrine is disastrous to discipline. In every other army in the world commanding officers are held to the strictest accountability for the conduct of their officers and men. Only the other day the popular colonel of a crack British battalion was relieved of his command because of the "ragging" of an unpopular officer by his fellow subalterns. Yet that colonel, like Major Penrose, might have alleged that he could not foresee the misconduct of his subordinates.

The Richmond *Times-Dispatch* comments with pride upon the acquittal at Danville, Va., of a negro accused of criminal assault on a white woman in the county of Amherst. The venue was changed to Danville, under a wise provision of the law which permits the transfer of a prisoner to another jurisdiction when the mayor of a city or sheriff of a county has had to call on the Governor for troops to protect the alleged criminal. At Danville everything proceeded with dispatch and regularity, and without any excitement whatever. The negro was able to prove an alibi, and was duly acquitted. As the *Times-Dispatch* remarks, no one can say that the story would have been different had the trial been held in Amherst County, but there might have been a lynching or a miscarriage of justice resulting in the death of an innocent man. The *Times-Dispatch* rightly regards this as a "high tribute to Virginia and our court system." It is all the more welcome in view of the result of the trial of the Strothers brothers in Culpeper, in which judge and jury gave way to the lynching spirit.

While the Filipinos are looking forward to electing their first General Assembly they have not been neglecting the other opportunities open to them. The report of the Philippine Bureau of Civil Service for the last fiscal year shows that their share in the government service in the islands is rapidly increasing. "Four times as many Filipinos as Americans," says the Board, "were appointed from the eligible registers during the period covered by this report." While there were decreases in the number of Americans and of native Filipinos examined for the Spanish registers, there were 2,231 Filipinos examined in English, as against 1,753 during the previous year. "The slight decrease in the per cent. of those passing is due principally to the fact that a greater proportion entered the more difficult grades." The gradual passing of the routine of insular administration into Filipino hands should be a cause for satisfaction even to those who hold most divergent views about the future of the islands. The convening of the Assembly will be another step away from a purely paternalistic government. At best a government much like that of Porto Rico's is in sight. But within a fortnight that island has shown us how short a time people once set on the road to self-government will be satisfied with such grudging measure.

Advocates of the Federal regulation of child labor are reported to be asserting that the action of the Alabama Legislature in adjourning without passing any law relative to child labor, is another argument for their plan of reform. As a matter of fact, the Alabama Legislature has not adjourned, but has merely taken a recess until July. Moreover, a child-labor bill, which is the best thus far proposed in the South, stands third on the calendar, and has been favorably reported by the Committee on Mining and Manufactures. As it is, the Legislature has already enacted a law providing that a State inspector shall visit and inspect the mills and factories of the State four times each year—a decided step in advance. A still better provision is in the child-labor bill itself. But if it were true that the Alabama Legislature is shirking its duty, the incident might perhaps illustrate the setback to State action, which is everywhere likely to follow from the agitation for a Federal law like the Beveridge bill. So far as the discussion of this measure goes, there is, we think, a growing feeling that, even if we must have national regulation, the Beveridge bill is not the kind of statute desired.

The extraordinary development of the gas engine is illustrated afresh by Lewis Nixon's plans for a destroyer capable of crossing the ocean in four days, and by the news that Vickers' Sons & Maxim have designed a gasolene battleship. The comparative simplicity and cheapness of the gasolene engine have done as much for pleasure-boating as for traffic on land; and fast automobile boats, such as recently raced on Lake Worth, clearly foreshadowed the time when large steamers would rely upon this type of motive power. That the hour was so near at hand, had, however, not been generally known, even though some of our newest and largest coasting schooners have been supplied with auxiliary engines giving them a speed of five or six knots. The New England fishermen are more and more turning to this engine, and even the hardy Gloucester "bankers" are no longer inclined to sneer at its usefulness. A drawback, however, is the Standard Oil monopoly, under which the cost of gasolene has steadily increased. If alcohol can be used in explosive engines of this kind, the days of the reciprocating engine will rapidly be numbered. In battleships the advantages of the explosive engine would be manifold. There would be a great decrease in what may be called the non-combatants among the crew, while the disappearance of boilers would make a great saving in weights and add to the room for fuel supply. The absence of funnels would also make possible a greater firing arc than at present. Altogether, no more interesting naval announcement has been made since the bringing forward of the turbine engine.

In spite of newspaper cartoons representing the United States army equipped with spades and led by an officer armed with a crowbar, charging the Panama Canal, the humble laborer is still badly wanted, and the War Department has been scouring Western Europe in search of him. One agent has succeeded in shipping 4,500 men, nearly all Italians or Spaniards, and they are still going forward at the rate of 500 a month. The Governments of Italy and Spain, however, are doing their best to prevent the exportation of labor that is badly needed at home. Should the supply in these two countries be cut off, we are told, "it is likely that Mr. Parke [the War Department agent] will make an effort to obtain men from Russia." If Mr. Parke moves towards Russia along the parallel of Madrid and Naples, he won't strike it; if he moves north he will find it getting colder and the climate quite different from Panama. The peasant is not likely to discard his sheepskin and high boots for tropical costume. Mr. Parke, we fear, will have to go further eastward to the swarthy Turkomans who pasture their mares by Oxus, the Sikh and Pathan who dwell on Indus's shores, and eastward yet till he finds the Canton coolie.

Since bonds of trade are usually supposed to make more strongly than any others for peace between nations, the reasons of the English Ministry for opposing the Channel tunnel make curious reading. The Prime Minister feels that even if the tunnel could be safeguarded against invasion, "there would be a feeling of insecurity, leading to constant demands for increased naval and military expenditure," which would not be compensated for, in his mind, by the advantages of the tunnel. This argument, we must confess, is a little too subtle for us. It is so easy to destroy the opening of a tunnel by a few charges of dynamite, and there are so many ways in which the ends could be fortified, that it is difficult to appreciate Campbell-Bannerman's doubts about protecting England from an invasion by French soldiery. From a Jingo Conservative Government such an attitude might have been expected, although its motives would have been not so much the desire to prevent international friction as to keep up the illusion that England must ever be in dread of conquest. Perhaps to understand properly the present Ministry's attitude, we must go back to the fifties, to the birth of the Volunteer movement, and recall how all England armed in anticipation of a sudden Gallic descent upon Albion's shores. The horrid nightmare from which the country suffered then has never been wholly forgotten, and it may be that fear of a French invasion must ever be as much a British institution as Westminster Abbey or the Tower of London or the Bank of England itself.

The cable dispatches announcing the conclusion of the long-heralded Anglo-Russian agreement may turn out to be as premature as other announcements have been hitherto, but there can be little doubt that a settlement of conflicting colonial interests between the two Powers is at hand. Important as such an arrangement would be in its international aspects, it could not fail also to produce a good effect upon the internal condition of Russia. In allying itself with a nation which freely criticises the unjustness of the autocracy and offers shelter to its enemies and victims, Russia would be giving hostages to the Liberal cause. An English Premier who cried "Long live the Duma" a few months ago would not fail to use whatever influence he may possess to see that the second Russian Parliament shall fare better than the first.

Nothing, perhaps, has so brought out the difference between the second Russian Duma and its predecessor as Monday's debate over the abolition of the summary court-martials established last year by Premier Stolypin for the pur-

pose of fighting terror with terror, but, as it turned out, only to foster terror. Here was an exhibition of autocratic ruthlessness compared with which exile to Siberia or imprisonment was a mild form of chastisement; yet the first Duma lashed itself into fury over its unanswered demand for amnesty, while this year "the debate was opened with surprising decorum and self-restraint." Last year the Deputies drove Military Procurator Pavloff from the tribune with cries of "Hangman"; on Monday, Premier Stolypin, who, from the extremist standpoint, has been responsible for a far longer roll of executions than Pavloff, listened to the debates for an hour and quietly withdrew. It would be vain to believe that the Left, or even the Constitutional Democrats, have forgotten or forgiven, and if *the* revolution should come in the next few years, M. Stolypin might find his account drawn up and checked, ready to be paid. But it is much that, in spite of all bitter resentment, the Opposition has decided to refrain from useless quarrelling and to do business. The session dragged at first, but at last the Duma has got down to work, and there seems a fair prospect of justice being done.

The possibility of intervention by France in Morocco over the murder of a French citizen recalls attention to the absolute muddle of anarchy and comic helplessness on the part of the Government that reigns in his Shereefian Majesty's dominions. Only a few weeks ago a joint French and Spanish fleet "demonstrated" in Tangier harbor and frightened the Sultan into sending an army against Raisuli. There was much firing of antiquated guns, the historic mule who is always the first victim to pay the price that staggers humanity, was duly shot, and the Terror of Tangier was compelled to flee. He is now reported on his way to join the Pretender, who holds forth not far from the very town of Ujda, against which it is said a French column of occupation is now to be directed. Nearly a year has elapsed since the drafting of the Act of Algeciras, which provided for the restoration of public order by creating a native police with Franco-Spanish officers, under a Swiss inspector-general. Yet at the present moment the inspector-general must have just landed in Morocco, if he is not still sojourning in Madrid. Before an adequate force is organized months will pass, and even then the activity of the new police will be confined to the eight specified ports. The interior must remain subject to riot, unless France decides to take some such action as she is now reported to be contemplating. Fraught with danger, as an energetic move on the part of the French Government must be, from the jealousy of Germany, there is hardly less risk in allowing the present chaos to continue and to breed, as it is continually breeding, rancors and jealousies between the two nations, that may culminate in a second crisis.

There seem to be good reasons for believing that the Belgian Cabinet, which has been in power since 1899, is not destined to maintain itself much longer. We are told that serious differences have occurred between the King and Premier Smet de Naeyer over the complaisant attitude of the Ministry towards the demands formulated by the Parliamentary Congo Committee, appointed after the great debate in the Chamber about two months ago, to prepare a definitive plan for hastening the annexation of the Free State by Belgium. The Premier, like the Cabinet in general, has been accused heretofore of dealing with the Congo question in a spirit of complete subservience to Leopold I.'s personal interests. That a break should come now between King and Premier argues that the Belgian Parliament is earnestly endeavoring to put an end to the state of affairs in Central Africa which has aroused protest in Great Britain and this country. The position of the Conservative Cabinet is made more difficult by serious disaffections within the ranks of its supporters. The Chamber, as elected in May, 1906, contains 89 Catholic Ministerialists, as against 47 Liberals, 28 Socialists, and 1 Christian Democrat. The Government majority of less than fifteen has become a precarious one in view of the existence of a group of Young Catholics, about twenty strong, which has shown itself ready to coöperate with the Opposition in matters of social legislation. Such an occasion occurred early this month, when the Young Catholics joined with the Liberals and Socialists in passing a law which fixes the actual working day in mines.

Nothing has occurred since the meeting of the new German Reichstag to give Chancellor von Bülow ground for believing that the alliance between the Liberals and Conservatives, of which he is so desirous, will actually come to pass. True, he has obtained for the present the majority he needs. But such a union as he contemplates has from the first been ridiculed by most of the Radicals. The idea that men with their views on reforms, political and social, could afford to tie up with reactionaries, protectionists, and Agrarians, seemed to them hardly worth serious discussion. On the other hand, the Chancellor's bait is no nearer being swallowed by the Conservatives. Herr von Kröcher's recent objection to the extent of the present electorate is merely a fresh illustration of the wide divergence of views between those of whom Von Bülow would make political bedfellows; for extension of the suffrage is one of the oldest and most prominent planks in the Liberal platform. What the Liberals have really to consider now is not an alliance with a party they have opposed, but a union among themselves. In the present Reichstag the three Radical groups, numbering 28, 14, and 7, respectively, while preserving their independence, have none the less agreed on a joint Parliamentary programme of considerable scope. Obviously, one solid group of forty-nine members would be better than three small ones. But the effort to bring about an amalgamation under the title of People's Party has failed once more, and even the present working arrangement is imperilled by ill-timed insistence upon the particular hobbies of this or that wing. That the present opportunity is a great one, no one can dispute. The Social-Democratic *débâcle* gives the Radicals an excellent chance to become the champions of democracy. If by the next election they have obviously lived up to their responsibility, they may look for public reward. If, however, they have been content with a subordinate or a characterless rôle, obedient in most respects to the Chancellor's wishes, the Social-Democrats will continue to rally the Germans who long for social and political progress upon democratic lines.

Lovers of Rome have watched with trepidation the project for an "Altar to the Fatherland" on the Capitoline Hill. The desecration of the Capitol in the name of patriotism is likely to exceed the gloomiest expectations. After a bitter struggle in the Commission, the majority has decided to accept the hideous equestrian statue of the *Rè Galantuomo* by Chiaradia as the centre of the composition. Bas-reliefs of large scale depicting the battles of the War of Liberation are naturally the subjects chosen to complete the work. In protest, members whose names weigh in the world of art have resigned, among them Bistolfi, Benedetto Croce, Corrado Ricci, and Andrade. It is to be feared that their action will be without effect. The matter is being treated, like so many similar projects in America, as a personal and political enterprise. A vigorous campaign in opposition has been waged by the enlightened portion of the Italian press. There is a general feeling that any gigantic monument on the Capitol is in the nature of sacrilege. But in Italy as elsewhere the politicians hold the trumps where a great government contract is involved. It is a melancholy reflection that whereas, at the beginnings of old Rome, the cackling of a few geese availed to save the Capitol, today the warning of Italy's best intelligence seems insufficient for that pious office.

AS TO "TREASURY RELIEF."

During the two or three past weeks of disorder and apprehension in financial centres, there has arisen, as always at such times, an anxious inquiry whether the Secretary of the Treasury will relieve the markets. The fact that, since March 4, we have had a new Secretary, has necessarily added to this anxiety. What Secretary Shaw would do in a given emergency could be pretty surely predicted in the light of his previous action. But Mr. Cortelyou's policy was unknown. The chances were that a new and cautious Secretary would hesitate to follow the precedents set by Mr. Shaw in his undoubted stretching of the legal powers of the Treasury. The uncertainty as to Mr. Cortelyou's purposes was probably more unsettling than positive knowledge that no "Treasury relief" whatever was to be looked for.

For this Mr. Cortelyou was not to blame. For him, or for any new Secretary, to say in advance exactly what he would or would not do was hardly possible. Circumstances might force reconsideration of any preconceived plan —as they did, for example, in 1894, when Secretary Carlisle had his unfortunate experience with the bond issues. We think, nevertheless, that the time has now come when a reasonably definite policy should be outlined by the Government. Mr. Cortelyou's hand has already been forced by the derangement of the markets, and he has made three moves which we may call tentative—offering redemption, in advance, of $25,000,000 Government bonds maturing next July; notifying banks which had pledged those bonds as security for public deposits that for such collateral they might substitute State, municipal, and railway bonds accepted by savings banks; and agreeing to leave with bank depositories $30,000,000 of public funds of which the recall had been expected. Some relief has followed these measures, but it has thus far been only indirect; and the question still remains as to what the Treasury's attitude will be in the event of continued and serious strain on the money markets.

Our opinion has been that, while intervention by the Government for relief of a disordered money market, is a mischievous and demoralizing practice, nevertheless it cannot be escaped so long as a surplus public revenue is actually drawing reserve money from the banks and locking it up in the vaults of the Government. When the Treasury has been playing such a rôle, the Government must restore that money to the market. We have not, however, the slightest sympathy with Secretary Shaw's idea that the Treasury should be made an engine for withdrawing cash from a plethoric money supply, and releasing it when money "tightens." Such paternalism is none of the Government's business, and the Secretary who practises it is certain, sooner or later, to make a bad matter worse.

Granting all this, there still remain—whatever may be the emergency in the money market—two essential questions: first, has the Treasury been locking up cash; and second, has it the means of lawfully releasing it? That the Treasury has been "locking up" currency, its own daily figures show. Since the opening week of January, the actual cash in its vaults, less outstanding demand liabilities, has increased some $25,000,000. This has resulted from an excess of public revenue over expenditure amounting to $22,000,000—an excess $13,000,000 greater than that of the similar period last year. Unquestionably, then, a reason exists for action by the Treasury to relieve disordered money markets.

The well-known obstacle still remains, that, by the letter of the law, United States bonds are required as collateral for public deposits in the banks, and that the available supply of such bonds is too small to provide security for largely increased deposits. Secretary Shaw rode rough-shod over strict interpretations, and agreed, four years ago, to accept other specified high-grade collateral. We then believed, and still believe, that by such a recourse the law was unwarrantably strained; and this contention Mr. Shaw virtually conceded by limiting carefully the amount of deposits which he would allow under such security. The so-called Aldrich bill, enacted four weeks ago, took some cognizance of this difficulty. Yet with the cowardly evasion, unpleasantly familiar in our past fiscal legislation, this bill gives no direct authority to the Treasury, in the matter of public deposits, beyond that of the old law; but it throws in a new proviso that "the Secretary shall, on or before the first of January of each year, make a public statement of the securities required during the year for such deposits." This feeble compromise seems to have been regarded by its authors as recognition of the Secretary's power to accept other than Government bond collateral. He has the right, we think, so to construe it; and indeed he has already done so in his announcement that such securities may be substituted for the maturing 4 per cents.

This being so, we are decidedly of opinion that the Treasury should both announce and pursue a consistent policy. If Mr. Cortelyou hesitates to allow the "free balance" in the Treasury to be reduced through deposit in bank when approaching requirements, for redemption of bonds or other purposes, may call for heavy payments, the case should be plainly set forth, and the bank deposits made with such limitations clearly understood. If the banks refused to accept deposits subject to early withdrawal, the Treasury would at all events be free from responsibility. But we cannot imagine such refusal in the existing market, when the call on the bank deposits, two or three months hence, would involve payment by the depositories, not into the Treasury vaults again, but into the open money market.

BOTHA AMONG THE PREMIERS.

A significant inquiry and answer were recorded in "question time" in the House of Commons, the other day. The Under-Secretary of the Colonies was asked if it were true that the Government had invited Gen. Botha to attend the Colonial Conference in London, and, if so, what reply had been received. To this Mr. Churchill made the interesting response:

> A telegram has been received from Lord Selborne as follows: "Prime Minister informs me that the Cabinet have unanimously decided that Gen. Botha ought to accept the invitation to attend the Colonial Conference." [Cheers.] "He will accordingly attend, and will be accompanied by Mr. F. W. Beyers, member of the Legislative Assembly for Turffontein, who will act as interpreter and secretary, and two other gentlemen who have not yet been decided on." [Cheers.]

Such is English self-government. Under it, a man who was doing his best five years ago to destroy English rule in South Africa, is to-day Prime Minister of the English self-governing Colony of the Transvaal, and is to join on equal terms the other Colonial Premiers in London to consult about the common interests of the British Empire. And Gen. Botha will undoubtedly get an enthusiastic reception. When Chamberlain invited Oom Paul to visit England, the shrewd old fellow refused to go and be exhibited as a captive behind Chamberlain's chariot. But the present Colonial Secretary, whom Gen. Botha held as a prisoner so short a time ago, will be foremost in doing honor to the stout Boer general.

Nor will even those in England who thought the grant of self-government to the Transvaal premature, and therefore opposed it, be behindhand in welcoming Premier Botha. His speech after being appointed Prime Minister did much to disarm lingering prejudice against him in England. In it, he spoke first, as would be expected of a soldier, of the point of honor. The old enemies of England had now been entrusted with the government of an English colony, and it became them to be loyal. He pledged himself and his Ministry—who have been said to resemble very closely the General Staff of the Boer army—to be as zealous and faithful as any in upholding the honor of the flag of a "great, united nation." Gen. Botha then went on to say that what he tactfully called "the old population" of the

Transvaal was now bound to be loyal to the Empire, not only by honorable obligation and self-interest, but by deep gratitude as well. The British people had trusted the Boers in a manner almost unexampled in history by giving them a free Constitution. Such generosity, the Boer general asserted, it would be impossible for Boers ever to forget. And then he spoke, not as one of a race, nor as the head merely of a party, but as the representative and trustee of all races and all parties in the Transvaal.

Indeed, it is gratifying to know that the first Transvaal election was not contested on racial lines. Mr. Smuts has testified that the majority won by the Het Folk was due to British votes. Outside the Rand, the great issue was whether the mining industries, in the hands of the great London and European houses, with their avowed desire for more Chinese labor, should have the real control of the new government; and on that score many British electors supported the Het Folk candidates who opposed the introduction of Asiatics. In Pretoria, for example, where the British citizens are in an overwhelming majority, several Het Folk members were returned. As Sir West Ridgeway, the head of the Commission to South Africa, has stated, "the coöperation of the British with the Boers in the election will have a very unifying effect."

This large, generous, and far-sighted policy towards the Transvaal, which the English Liberals have carried out and which even the English Conservatives are now forced to praise, strikes deep into the whole problem of representative government. Having once put its hand to that plough, a nation must not look back. To be true representatives of any people, men must be freely elected by them; natural leaders must be allowed to come to the front; and the real sentiments of citizens given the most ample expression. By comparison with this thoroughgoing and successful English plan, our own legislation concerning Reconstruction in the South, after the civil war, looks bungling in the extreme. We began by absolutely disfranchising the best men in the South, and disqualifying its natural leaders from holding Federal office. And ten years after the war, when the South was again permitted to send its ablest citizens to Congress, we saw Blaine trying to make himself President by descanting on the enormity of so many "rebel brigadiers" making laws for the Union. Contrast with this the imperturbable English making *their* rebel brigadier a Prime Minister!

Irish Nationalists are not slow to press the point so obviously in their favor. If Dutchmen can be trusted to rule locally a British territory, why not Irishmen? If Home Rule is good for the Transvaal, why not for Ireland? These questions will become freshly pertinent, and the spectacle of Gen. Botha among the Premiers will be doubly suggestive, when Mr. Birrell brings in, after Easter, the Irish Home Rule bill.

A FRENCH IDEAL IN EDUCATION.

Prof. Barrett Wendell's article on French universities in *Scribner's Magazine* for March presents facts and reflections which deserve serious consideration from American educators and American youth who would study abroad. During a year of lecturing at the universities of France, Professor Wendell had unusual opportunities to observe the working of these institutions, both in Paris and the provinces. He speaks of the intense earnestness of the students; and of the teachers he remarks:

> They may never relax their effort to extend and solidify their learning. My previous experience had never revealed to me anything like such a spectacle of concentrated and unceasing intellectual activity as seemed a matter of course among my temporary colleagues at Paris.

In illustration of his point, Professor Wendell tells of a Sanskrit scholar who was busy on Chinese, because "you can no more discuss Buddhism without studying the standard Chinese commentaries thereon than you can discuss Christian theology without reference to the Byzantine fathers." Both propositions, which seemed to the Frenchman "axiomatic," would, as Mr. Wendell justly remarks, "have seemed, among ourselves, rather utopian."

And yet the French scholars are not swamped by their facts; they retain what Mr. Wendell calls "the dynamic quality of mental habit." Their immense erudition is not a burden, but a stimulus. This is the reason why Professor Wendell believes that "American learning would be greatly strengthened if more of our graduate students came under French influence." Admitting that the influence of German scholarship on America has been admirable in that it has "taught us a respect for fact and method which our earlier learning lacked," Professor Wendell feels, as do many others among us, that this influence has also tended "to encourage the notion that the object and end of all learning is the methodical collection of fact." Though this error is not prevalent among the higher minds of Germany, it is "apt to possess the minds of Americans who, having studied in Germany, come home no longer American, nor yet soundly German."

American scholarship often falls between the two stools. We are likely to have at one end of that log on which Mark Hopkins used to sit the myopic scientist confused by his heap of facts; on the other end, the plausible lecturer, guiltless of anything that may be called exact knowledge, entertaining and misleading the undergraduates by swift and silly generalizations. If the grubber for roots could generalize, if the dilettante knew anything, each would be a useful member of a college faculty; but as it is, the hungry sheep look up and are not fed.

On our sufferings at the hands of Dr. Dryasdust we have frequently dwelt. His doctoral theses have been one of our pet abominations. It has seemed pathetic that a kind husband and father, who might have had a happy and useful career as a plumber, should give years of time and what little intellectual energy he could command to counting the color-words in Browning or to classifying the grammatical constructions of Tennyson. It is the fate of the pedant of this type to treat great literary masterpieces as if they were not literature, but merely a *corpus vile* for exercises in linguistics; and on the other hand, to treat rude chronicles and early documents, so important for the light they throw on the development of civilization, its language, and its arts—to treat this huge mass of infra-literary matter as if it were an "Iliad," a "Divine Comedy," or a "Hamlet." And yet these indefatigable toilers have their reward. They win a reputation for prodigious learning, because, as Matthew Arnold noted in his "French Eton," most men do not know what distinguishes good teaching and training from bad. And this reputed erudition puts the square peg of a cataloguer of obscure forms of Anglo-Saxon, into the round hole of a professorship of literature.

The dilettante, too, the darling of women's clubs, and of undergraduates who want soft courses, has his path strewn with roses. His classes are crowded; and the college authorities are convinced that a man who attracts so many students, who makes so much noise, who gets into the newspapers every week, and who seems to all outsiders such a big toad in the academic puddle—that this paragon of brilliancy is the most stimulating of teachers. We fear, however, that college presidents, who, after all, are human, sometimes fail to distinguish between stimulation and intoxication. Be that as it may, American colleges are infested with both these types, from which the French universities seem singularly free.

Our greater danger, taking the country as a whole, is, we incline to think, from the purblind accumulator of facts. His tribe seems to be increasing more rapidly than that of the immature philosophizer. But since we should like to escape from both, we agree with Professor Wendell that American scholars peculiarly need the tonic which France offers.

NEW WRITERS OF LATIN AMERICA.

For years we Americans of the North have looked to Latin America as the land of discords. To correct an impression, which has certainly had much to justify it, let us turn to a field of Latin-American activity in which a singular harmony rules. A casual reading of the little anthology, "La Jóven Literatura Hispanoamericana," by Manuel Ugarte (Paris: Colin), will show that the younger writers of the southern continent not only speak with one tongue, but think with one mind. Indeed, one may fairly speak of a Spanish-American school, in a sense of the word that would hardly apply to the more miscellaneous production of North America. It is significant that this selection is published in Paris, and that the editor's modest introductory essay is a model of systematic criticism of the modern French type. These things are symptomatic, for a most cursory reading of the hundred and more authors represented would show that they had almost without exception formed themselves under the influence of the latest French literature—often filtered to them, no doubt, through Spanish writers.

But it should be understood that the younger South American writers are by no means simply the sedulous apes of their models. They have used the French tradition merely by way of realizing their own ideals. Many of them have studied in the higher schools of Paris. All seem to entertain ambitions similar to those of the realists, analysts, and symbolists of recent France. And this consideration leads to the paradoxical reflection that this rising Latin-American literature may be said to be born decadent. These young aspirants of a new world have in a large measure affected the mood of the world-weary Verlaine, Moréas, Mallarmé. The harm of this sort of green sickness has been small, however, as Señor Ugarte points out. In fact, this new preciosity of mood and diction has probably worked beneficially upon a literature sadly in need of discipline. The apostles of the ultra and precious have at least, in half a generation, forged a new style, nervous, precise, and telling—fit, in short, for modern needs.

In view of the cosmopolitan tone of almost all this writing, the absence of any influence from English or German literature is noteworthy. These writers know their Whitman and their Nietzsche, but give themselves to the cult neither of the overman nor of fraternalism. Politically, their attitude towards this country is one of constraint, if not of suspicion. In our gigantic industrialism, in what they take to be our dreams of conquest, they find something antipathetic, if not positively menacing. The irony, and sometimes indignation, with which Mr. Roosevelt, "Profesor de Energía," is dealt with by such writers as Rubén Dario of Nicaragua and Marquez Sterling of Cuba show that the exponent of the simple and strenuous life offers a complicated and baffling problem to Latin-American analysts. This is a fact not to be greatly wondered at or deplored. In fact, any intellectual *entente* with Spanish America will come rather through frank perception and acceptance of fundamental racial differences than through insistence upon sympathies that do not exist. When we understand why Don Quixote is canonized there, and they understand why we resist the Gallic perfections that seem so essential to them, then and only then can an intellectual comity of the two continents begin to realize the rhetoric of the Pan-American congresses.

Perhaps the only serious exception to be taken to this collection of Latin-American prose and verse is that it gives such a slight and imperfect picture of the actual life of the Southern republics. One notes an interesting realist group in Chile. Their chapters arouse a curiosity for their books, but much of the volume moves in the no-man's-land of the poets or in realms of criticism. Most of these writers are nostalgic, and they are only learning to make their own land classic to themselves. There is much hope, however, in the fact that this company of writers, representing a high and valuable order of talent, is really young. Not in the sense that any talented and rebellious person of fifty or thereabouts is a *jeune*, but really young. It is a book of men in their thirties, of men who are only beginning to show their literary parts, a book of men who pursue literature chiefly as an avocation, making of journalism, politics, or teaching their trade; as such it is a book of great promise.

We should recall, finally, that Latin America represents already a considerable mixture of blood, and is to be increasingly the field of immigration. Señor Ugarte's roll includes, with a great preponderance of Spanish, a notable sprinkling of English, French, and German names. Unquestionably, the Germans of Rio Grande do Sul and the Italians of the Argentine will be making themselves felt when the next anthology of Spanish America is compiled. We dwell upon these obvious facts because of the interesting prospect they disclose. Here at the North literature is recruiting itself from all the races of the earth, but developing along Anglo-Saxon lines; there at the South a somewhat similar, at least equally a mixed race, will express its finer aspirations under the strictest tutelage of the Latin tradition. The future will witness a parallel, if not a competition, the mere hint of which must stir the blood of every literary historian of the new comparative school.

FIVE YEARS OF THE CARNEGIE INSTITUTION OF WASHINGTON.

Most of our readers will remember the pleasure which spread through intellectual circles at home and abroad when Andrew Carnegie, a little more than five years ago, constituted a Board of Managers to be known as the Carnegie Institution of Washington, and entrusted to them, in five per cent. bonds, the sum of $10,000,000 for the advancement of science. In the interval that has passed many experiments have been tried, most of them fruitful; and, on the whole, the story is invigorating and worth recapitulation. The records may be found in five large year-books—the latest of which has just appeared—and in a list of publications which is separately issued. Much of this information is so special and sometimes so technical that it is of significance only to a very limited circle, but there are certain broad aspects of the work in which all educated men are interested, and to these we propose to call attention.

One preliminary word in respect to the organization. The conduct of the Institution is entrusted to a board of trustees who appoint members of an executive committee, and this committee acts as an advisory board, a sort of cabinet or council, to confer with the president of the Institution upon the methods of carrying out the projects which have been approved in general terms by the board. This important office of president was originally held by Dr. D. C. Gilman, and when he gave it up, because of his advancing years, Dr. R. S. Woodward, distinguished as a physicist, and for many years a professor in Columbia University, New York, succeeded to the post. He is a man of broad views, varied acquirements, and excellent administrative capacity. In making up the original board of trustees, the founder did not select the actual members of college faculties, and he chose, for the most part, men who had had experience in the conduct of public affairs on a large scale. In the heart of the city of Washington a suite of office rooms has been rented by the Institution, but they are already too restricted, and accordingly a site has recently been chosen and plans have been accepted for a permanent building. This is to be a simple and dignified structure, well arranged for the transaction of complex affairs, and for the assembly of scientific men.

For a time the authorities spent a good deal of money in the assistance of young men and women who wished to carry forward advanced scientific work, not as candidates for academic degrees, but as students of important problems. The results of this experiment were not highly satisfactory. It is true that some of those who were selected showed remarkable ability and perseverance, but either because of faults in the mode of selection, or because the requirements of the Institution were not well understood, many failed to show any unusual powers, and after a limited trial the plan, though not abandoned entirely, was modified and restricted. Further changes are now proposed, and the subject is fully discussed by Dr. Woodward in the fifth year-book. The plan could not be abandoned—even in the improbable case that anybody should desire to give it up—be-

cause the founder, in his trust deed, specified, as one of six aims, the enabling of such students as may find Washington the best point for their especial studies, to enjoy the various opportunities afforded by the scientific foundations of the United States Government. It may be well to remind the reader that Mr. Carnegie seriously considered the establishment of a university in Washington, but for reasons which he stated when he presented the trust deed he gave up this idea. His attention had been called to the two functions of a university, namely, the education of youth and the promotion of knowledge. He chose to limit his benefaction to the second of these functions, although in a subordinate and unsystematic manner encouragement might be given to those who wished to pursue advanced studies. He would not entertain the idea of establishing professorships or of appointing professors or of providing academic guidance for students of university grade. He would concentrate the resources of the Institution upon the advancement of science by such means as might be found serviceable as the plans were developed.

An examination of the year-books will show that the management began with aiding a great many minor projects by grants of a few thousand dollars, sometimes much less. But recently the force of the Institution has been chiefly directed to large projects which involve outlays of a much greater amount, and are continued from year to year. Eleven of these larger departments of investigation are now in operation. This is a list of them and of the chiefs in charge:

Botanical Research: D. T. MacDougal, director.
Economics and Sociology: Carroll D. Wright, director.
Experimental Evolution: Charles B. Davenport, director.
Historical Research: J. F. Jameson, director.
Horticulture: Luther Burbank.
Marine Biology: A. G. Mayer, director.
Meridian Astronomy: Lewis Boss, director.
Nutrition: F. G. Benedict, R. H. Chittenden, L. B. Mendel, and T. B. Osborne.
Solar Physics: George E. Hale, director.
Terrestrial Magnetism: L. A. Bauer, director.
Work in Geophysics: F. D. Adams, G. F. Becker, A. L. Day.

The work initiated under these departments is thus far the principal achievement of the Carnegie Institution. Each of them is fully set forth in the fifth year-book.

In reviewing the activities of the Institution mention may first be made of the publications, for by them chiefly the public can be informed of the results that are attained. The latest list includes seventy-eight works, some of them in quarto, most of them in octavo form. These are sent to the principal libraries and learned societies throughout the world, so that they are everywhere accessible, and any or all of them may be bought at very moderate charges by applying directly to the office in Washington. An examination of the list will show the preponderance of biological studies, including those in the realms of zoölogy and botany. The papers in physics, chemistry, and geology stand numerically in close succession to those in biology. The number of mathematical papers is small, but it includes the collected works of George W. Hill in four quarto volumes, three of which have already been distributed. The catalogue of double stars by S. W. Burnham is in press, a study of observed positions of sun spots by C. H. F. Peters, and a catalogue of stars within two degrees of the North Pole, from photographic plates, by Caroline E. Furness. Arrangements are made for the publication of an atlas of the Milky Way by E. E. Barnard. In the field of archæology and geographical research, special mention should be made of Raphael Pumpelly's explorations in Turkestan, already printed, and of the further report of his expedition to that country, which is now in press. The Egyptological researches of W. Max Müller are already published. Several papers by G. O. A. Dorsey on the traditions and myths of the aborigines of America have been printed. These are only illustrations of the activity of the Institution. To give a complete enumeration would involve reprinting the catalogue to which reference has already been made. In general it may be affirmed that but few of these important memoirs would have seen the light were it not for the generous provisions of Mr. Carnegie. In addition to those which bear the imprint of the foundation, a large number of minor papers have been contributed by collaborators of the Institution to the various journals of science. The last report enumerates by title two hundred and thirty-six of such communications, more or less the resultants of Carnegie aid.

One of the most important, as well as the most interesting, of all the so-called "larger projects" is the work carried on in the Solar Observatory at Mount Wilson, California, constructed and maintained by the Institution, under the direction of Professor Hale. The Carnegie appropriations have been supplemented by generous gifts from John D. Hooker of Los Angeles, who provided a sum sufficient to purchase a mirror one hundred inches in diameter for a reflecting telescope. Much of the force of the director has been given to the study of the spectra of sun spots, investigations which he regards as likely to be the surest guide in more general investigations of stellar phenomena. A considerable amount has been appropriated to enable Professor Boss to prepare a catalogue of stars, giving their precise positions, from the brightest down to those of the seventh magnitude inclusive. For the study of terrestrial magnetism, the Institution has secured the services of Dr. Bauer, who was for a long period connected with the United States Coast and Geodetic Survey. An observing ship, the Gallilee, has been carrying forward the magnetic survey of the Pacific Ocean, and the work will be continued, perhaps with a superior vessel and a better equipment.

In the promotion of biological studies the Institution maintains a desert laboratory in Arizona, in charge of Dr. D. T. MacDougal, which affords unrivalled opportunities for the study of the flora of arid regions. There is also maintained at Cold Spring Harbor, L. I., under the direction of Professor Davenport, a laboratory where an attempt is making to determine the characteristic relations and laws manifested in the process of evolution in plants and animals. Dr. Woodward calls attention to the fact that here, as in almost all the departmental work of the Institution, a decade is the smallest convenient time unit for measuring the progress of important investigations. The public must therefore be patient. A third laboratory, devoted to the study of marine biology, is situated at the Dry Tortugas in Florida, a location most favorable for securing an abundance of marine fauna, most important for embryological and morphological study; and yet the station is so subject to tropical storms that the laboratory may not safely be kept open for investigations throughout the year. Closely allied with the work of these laboratories is the study of nutrition. Inquiries which are of great practical and theoretical importance in this field have been carried forward by Professor Benedict, and it has recently been decided to open a special laboratory for the prosecution of such researches, probably in Boston, near the Harvard Medical School.

Dr. Wright has been in charge of the department of economics and sociology. About a hundred and thirty collaborators are engaged under his direction, and many separate contributions from them are now ready for publication. Among others, a noteworthy bibliography has been made of the public documents of the States of the United States. Dr. Jameson, recently of the University of Chicago, has removed to Washington, where he is director of the department of historical research. His attention is chiefly directed to American subjects.

This is a meagre résumé of some of the most important projects encouraged by the Carnegie Institution, but it would be difficult to enlarge it without making a number of technical statements inappropriate to this place. Two philological and literary investigations should, however, be mentioned. Dr. Ewald Flügel is engaged in the preparation of a lexicon to the works of Chaucer, which will be a very important contribution to the history of the English language, and Dr. H. O. Sommer is making a careful investigation respecting the early Arthurian romances. These allowances show that the Carnegie Institution includes Literature as well as Science in its purview. Furthermore, it gives annual stipend to the schools of classical studies in Rome and Athens. While medicine in its various ramifications does not come under the present scheme of activities, doubtless because the Rockefeller Institute in New York has the field, the bibliographical encouragement of medical research is promoted by a liberal subvention to the "Index Medicus," a well-known and most valuable publication, which was moribund for want of financial support until the Carnegie fund provided for it.

NEWS FOR BIBLIOPHILES.

The books belonging to Louis M. Dillman of Chicago sold by the Anderson Auction Company of this city on March 21, brought good prices generally, and some important books made new records. The highest price was $900, for a presentation copy of Keats's first book, the "Poems" of 1817, original boards, uncut. It had Keats's autograph inscription on the title. This copy brought £125 at Sotheby's in 1901. The Rowfant copy of "Endymion," 1818, bound in morocco, but with a four-line manuscript fragment of "Lamia" and autograph notes by Tennyson, Hood, and Locker, brought $475; "Lamia," 1820, $200; Browning's "Pauline,"

1833, the Maxwell-Morgan-Appleton copy, brought only $810, though $1,025 was paid for it at the Appleton sale in 1903. The first edition of the "Rubáiyát" of Omar Khayyám, Fitzgerald's translation, 1859, brought $335. This was the little paper-covered book of which the late Mr. Quaritch said:

Nearly the whole edition I sold (not being able to get more) at one penny each. Mr. Fitzgerald had made me a present of about two hundred copies of the two hundred and fifty he had printed.

The books by Charles Lamb or associated with Lamb brought for the most part good prices. The following are the more important items: "Tales from Shakespeare," 1807, original boards, uncut, $800; "Mrs. Leicester's School," 1809, original sheep, $125; "Elia," and "The Last Essays of Elia," 1823-33, uncut, bound by Riviere, $150; "Poems on the Death of Priscilla Farmer," 1796, $180; "Blank Verse," 1798, by Lloyd and Lamb, original boards, uncut, $120. Milton's "Poems," 1645, a good copy, in morocco by Riviere, brought $490. Rossetti's "Sir Hugh the Heron," 1843, his first book, ran up to $140; the *Germ*, four numbers, bound, $150; "Poems," 1869, a private issue, probably proof sheets, $128. The most important Shelley was "Queen Mab," 1813, original boards, uncut, at $650.

Only meagre reports have been cabled of the prices paid for W. C. Van Antwerp's books at Sotheby's in London Friday and Saturday last. The First Folio Shakespeare, the large and fine Rowfant copy, was bought by Quaritch for £3,600. Mr. Van Antwerp paid $13,500 for it. This was one of the four books noted in the *Nation* of February 7 as preëminently important. The three others were:

(1.) The Kilmarnock Burns, 1786, original paper covers, uncut, apparently one of three known in this condition, brought £700. Mr. Van Antwerp had paid $4,500 for it; nor was this price excessive, as the Burns Cottage Association at Ayr, Scotland, paid £1,000 for a similar copy in 1903. The Lamb copy, now in America, which brought £572 5s. in 1898, is the third copy.

(2.) Izaak Walton's "Compleat Angler," 1653, first edition, the Rowfant copy, original sheep, brought £1,290. Mr. Van Antwerp paid $2,500; and the previous high record at auction is £405, paid in 1903 for a copy in contemporary tooled morocco, probably a presentation copy from Walton himself.

(3.) Hubbard's "Narrative of the Troubles with the Indians in New England," Boston, John Foster, 1677, brought £450. The volume is in the original sheep, with the genuine map, but is chiefly notable as having belonged to the Hawthorne family ever since it was published. Mr. Van Antwerp paid $1,500 for it.

The total for these four items was £6,040, or approximately $30,000, for what had cost the seller $22,000. Of course the auctioneer's commission and expenses must be deducted, probably from 10 to 12 per cent. for books of this character, though the percentage would be higher on less valuable books. These particulars are not given with the idea of encouraging any person of limited means to buy rare books solely as an investment. Among book collectors to-day too few really love their books and too many think principally of the money value. The man who buys new books and puts them away until they have doubled in value will occasionally come out all right, as did many of the first purchasers of the Kelmscott books; but such cases are not common. It is doubtful if even fine copies of the books of Shakespeare, Shelley, Lamb, and other favorites among collectors now, will continue to rise in price as rapidly as in the last ten years. While it is unadvisable for any one to buy rare books and hold them for a rise, the owner of the rarest collector's books, whether first editions of English or American authors, early printed books, or Americana, can, when the necessity of selling comes, get back a considerable, often a large, part of his investment; and the pleasure of possession for a time (if the collector be a book lover) will more than compensate him for his loss.

Bertram Dobell, that indefatigable London bookseller and discoverer of interesting manuscripts, writes to the *Athenæum* this account of his latest treasure:

Most of your readers, I suppose, will be glad to know that I have recently discovered a very remarkable manuscript copy of Sir Philip Sidney's "Arcadia." It is a volume of 226 folios, or 452 pages. It contains a complete copy of the "Arcadia" in five "Bookes or Actes," and also "Dyvers and Sondry Sonetts." Although there must have been a number of manuscript copies of the book in existence soon after it was written, no other copy save that which is before me appears to be now extant. This alone would make it uniquely interesting; but its value does not lie only in its rarity. It is not merely an "Arcadia"; it is, I believe, *the* "Arcadia." It differs greatly from the printed texts. It contains much matter which is not to be found in the latter, while it omits much that appears in them. It gives us five new poems, and many fresh readings in the known poems. Among the "Dyvers and Sondry Sonetts" there is also an unknown poem. I have not yet been able to study the manuscript sufficiently to be able to see the exact relation which it bears to the printed copies; but I have found a good many indications which point to its being Sir Philip Sidney's first draft of the work. But whether it is this, or whether it is a recast of the first form of the romance, it is without doubt a most remarkable "find." Short of the discovery of a Shakespearean manuscript it is hard to imagine a more valuable treasure trove of its kind. Two things are plain—firstly, that it should find a place in one of our great public libraries; and, secondly, that it should be printed with as little delay as possible.

The library of Ferdinand Brunetière is to be sold; an American bid in the interests of Harvard has already been received. The library is what might be expected from the maker's writings. It contains more than 12,000 volumes of theology, history, philosophy, foreign literature, criticism, and ancient and modern erudition, with a natural predominance of French classics. There are many first editions, which Brunetière loved and collected for critical reasons. There are books with marginal annotations by Sainte-Beuve; one of them—Pascal's "Pensées"—would furnish an interesting pendant to Sainte-Beuve's marginal notes on La Bruyère, published some years ago. The copious annotations written by Brunetière himself along the margins of authors whom he particularly loved or hated also deserve publication. Only a Frenchman, perhaps only one of his own disciples, could properly edit such uncorrected first thoughts of a mind so passionate and sincere, as well as so powerful and completely trained. The principal authors annotated are Bossuet, the great critic's favorite; Vinet, whom he ceased reading because, "when I chance on an idea, he has always had it before"; Fromentin and Taine in æsthetics and Renouvier in philosophy; Eugène Burnouf; De Maistre, for whom early dislike grew to final admiration; and Renan, whom he never liked or trusted.

Correspondence.

LITERATURE AND PHILOLOGY.

To the Editor of The Nation:

Sir: What is responsible for the existing confusion in the aims and practices of education? Is it wholly the much-censured materialistic spirit of the age? Great foundations like the Carnegie Institution for the advancement of original research, in literature as well as in science, would seem to deny this. Is it the dislocation of all real correlation of educational forces brought about by the premature adoption of the elective system with its boyhood suffrage? Is it, in part, the maladministration of specialists, who apparently make no sufficient qualitative analysis even of their own work? We as yet lack perspective to apportion the responsibility among these forces or even to decide with finality what is cause and what is result; but it is easy for the onlooker to criticise certain obvious defects or excrescences at various stages in the educational system. These criticisms are to be welcomed by all open-minded scholars.

In a recent editorial in the *Nation* the output of the universities in connection with the doctoral dissertation was made the subject of discussion. The absurdities in a certain bulky volume were made sufficiently clear. They may even have seemed exaggerated or exceptional to any one who was not painfully familiar with such affronts upon literature, both at home and abroad. In that article there seemed, however, to be a tacit blending of two lines of criticism—that pertaining to philology (in the narrower sense of linguistics), and that pertaining to the æsthetic appreciation of literature. No one, I suppose, would deny that comparative philology is to be classed distinctly among the sciences. Its raw material may be found in a highly developed literature like Greek or English, or in the dialects of darkest Africa. As a form of intellectual activity, it is as distinct from pure literature as is Shelley's "Cloud" from the science of meteorology. That there are many futile investigations in both of these subjects only reflects upon those who undertake or champion them. Minute examinations of extremely narrow fields are often carried on by immature students both in philology and in literature. The cure is the same in each case—a wider range of preliminary observation and reading as a background for special study; or, in cases like the one in question, more drastic measures might be necessary, such as change of method, subject, and investigator.

We enthusiastically agree with the conclusion of the article that scholars must

"abandon the notion that all facts are of equal value and that skill in juggling words is æsthetic appreciation of literature." But here again, as in the body of the article, two different things are criticised. First, a barren pursuit of philology, and second, a confusion of philology with literature. Is it not well to consider these apart? Philologians may, by mistake or by stress of college finances, be installed in chairs of literature or a philological professorship be given to a student of literature. But the Ph.D. degree may properly be conferred for work done mainly in either province. The suggestion that a new degree with different letters be invented to designate discipline that makes for culture is quoted with some approval. No proof, however, is offered that this would secure an influx of better material from which to choose. Nor is it made clear that "an æsthetic appreciation of literature," unsupported by sufficient training on the philological side, would not be a somewhat elusive criterion for the worth of scholarly promise. And it is hardly consistent with facts to imply that many dissertations have not been contributed directly to the discussion and appreciation of pure literature. Surely it is not asserted that philological research, as such, is not of the utmost importance. This would be to discredit scientific work from Bopp to Brugmann. If it is merely urged that the territory must be more sharply defined and the quality of the work more rigidly supervised, there can be no dissent.

Philology is not literature. Both the method and aims are different. But it is an essential supplement to the study of literature. Sound scholars will, I suppose, unite in demanding even for the student of literature some formal study of the structure of language and will not allow him to suppose that he can be much better than a jelly-fish if the bony skeleton is wanting. The lack of perspective charged upon the doctoral dissertation, especially in modern languages, may be found in other fields of work. The dreary details, for example, about some insignificant inhabitant of a New England village may conceivably contribute a missing link in a larger historical generalization, but they may yield only an exercise in the historical method, and in so far be as *déclassés* in the company of original researches as is the essential but elementary practice in translating from the vernacular into French or Greek. This much, at least, must be said. Among all the handmaids of literature philology is least likely to have popular recognition. New and startling generalizations of phonetic law are not discovered by every investigator. It is less spectacular than its sister handmaid, archæology, which with good reason dazzles the public as it from time to time lays bare a Theban palace or recovers inscriptions, manuscripts, or treasure to illustrate, correct, or reinforce our knowledge and appreciation of history and literature. Yet it is true that philology as a disciplinary study, thanks to its own growth and to supplementary subjects like archæology, has now far more for us than it had for our grandfathers; and it is therefore difficult to understand the undiscriminating attitude of intellectual men who have allowed themselves to join the effervescent Ephesian mob and to cry out for the space of the last two decades: "Great is the enormity of the gerund-grinders."

But to him that estimates literature at its true worth, philology and archæology are, after all, only handmaids. If Matthew Arnold in his "Epilogue to Lessing's Laocoön" argued correctly that poetry can interpret life with more authority than can even music or painting, and if President Eliot at the Longfellow celebration could declare that, except religious inspiration, there is no service of man to man comparable to the writing of noble poetry, we may justly exact an inexorable *droit de seigneur* of subjects ancillary to the needs of literature.

PROFESSOR DÖRPFELD'S DISCOVERIES

TO THE EDITOR OF THE NATION:

SIR: In your issue of March 14, you speak, on the authority of a dispatch from Berlin, of the discovery of an Homeric city upon the island of Ithaca by Prof. W. Dörpfeld of the Imperial German Archæological Institute. In the absence of detailed information, I venture to suggest that the discovery was made, not on the island of Ithaca, but in Leucas, which, as is well known, Dörpfeld believes to be the ancient Ithaca.

I left Piræus for Genoa with Dörpfeld last July, shortly after he had finished his season's work at Leucas. He had made important discoveries which he discussed freely, although he was not then ready to make any public announcement of them. He had found the side wall of a building which, from its resemblance to the palace at Cnossus, he believed to be a Mycenæan palace. Mycenæan palaces are of two types; the Cnossus type and the Tiryns type. The palace of Odysseus, he argued, was of the former type, and this fact clears up several difficulties in the account of the slaying of the suitors in the Odyssey. A tradition of this style of building lingered into historical times, as the temple of Apollo at Bassæ shows. The vase fragments which Dörpfeld had found up to that time were of a very primitive character. He was looking forward to this year's campaign for important discoveries, and these he seems to have made. All classical scholars must await with impatience further news from Athens.

PUBLIC LIBRARIES AND POLITICS.

TO THE EDITOR OF THE NATION:

SIR: Even though the "Librarian" who writes of "Politics in Library Management" in your issue of March 14, limits his criticism to the "actual state of affairs in a number of our larger libraries," yet for fear that some one may jump to the conclusion that the writer really meant to describe a condition that is general, and thus unintentionally do an injustice to a body of high-minded and devoted public servants, I ask a little space for the purpose of stating my own observations on the conduct of public library affairs, in order that I may defend the chief librarians and library trustees of this country from charges which may seem to be implied in the letter you have published.

At the outset I will say that probably no one would claim that "the modern public library is *invariably* conducted with a nobility of purpose and an unselfishness of administration which amounts to sacrifice." The millennium has not yet come in library affairs, any more than it has in school or church affairs. At the same time I believe it may be claimed and shown that public libraries the country over, including especially, almost without exception, the large libraries which "Librarian" subjects to his main criticism, are managed with rare devotion to public good, and are freer from so-called "politics" than any other branch of the public service. I base this claim on relations as chief librarian with two municipal libraries, one of which has to secure part of its support from a city council, and the other its entire support from congressional appropriations, and on intimate personal relations with many municipal chief librarians, with whom I have discussed confidentially methods of securing appropriations and methods of making appointments and promotions.

Of course, every chief librarian who finds his greatest delight in conducting his library efficiently, regrets that he must spend so much time in securing appropriations from reluctant legislative bodies. Better far would it be if we had but to make known our needs to have them met to the full. But the place and needs of the public library in the scheme of public education are still so new that much time must be spent in educating the public, and especially members of appropriating bodies, on the subject. If to write newspaper articles, to appear before appropriation committees, and personally to know and attempt to influence councilmen so as to secure somewhat more adequate appropriation, is to be a "lobbyist," then the word becomes a title of honor, for it represents the fighter of the hardest battles for library advancement.

While on this subject of appropriations for running libraries let me say that no municipal library is yet doing more than one-third of the work that it could do if it had proper appropriations. The work of every live library is growing so much more rapidly than its appropriations that it is hampered at every point, and at none so much as in the matter of paying adequate salaries. America claims to believe in education, but rarely does it believe in it to the extent of paying good salaries to its teachers and especially to the employees of the younger institution, the library. To get sufficient money to secure at the same time more library assistants and to pay new and old assistants decent salaries, is all but impossible. "Librarian" complains that library assistants are better equipped in mechanical dexterity than in literary attainments. The reason is not far to seek. Proficiency in technique is a practical necessity, and through apprentice classes can be secured, but the addition of literary proficiency cannot usually be secured for the $30 or $40 a month which is perforce the usual compensation of the rank and file of library employees.

The charges of flattery and cajolery, special privileges, nepotism, appointments at behest of bosses, promotions by personal

favoritism, the creation of cumbersome and unnecessary departments, even though confined to "a number of our large libraries," are also likely to be considered as general criticisms, and as such require something to offset a possible wrong impression. My observation and experience with the municipal libraries of the large cities of this country tend to conclusions which are all on the other side. Moreover, most public libraries are either under municipal civil service commissions or, if not, their administrators have organized within the library what are practically civil service rules, in order to keep out incompetents, and to make promotions for proved efficiency. After struggling so hard to get increased funds with which to carry on our rapidly expanding work, it would be the height of foolishness on the part of librarians to fill up the library service with incompetents, and I believe that this is very rarely done. My own observation is that efficiency is all but universally the test for appointments and promotions. As for library employees, whether "chiefs" or other assistants, having so little to do that they are ever "planning and launching some fresh foolishness," this would be a severe and I believe an unjust charge if directed against library management as a whole. My own experience and observation have shown that detail work, the mere mechanics of getting books into the hands of the public, is so heavy that all too little time is left for planning new lines of activity to make the library more vital, to increase its efficiency as a literary agent.

But "Librarian" closes his letter with a paragraph which shows that he has an appreciation of trained librarianship, and the transformation library work is undergoing through its influence. It is a pity that his letter as a whole seems somewhat to negative what I believe to be the fact, namely, that the true professional spirit does dominate the situation so fully that the evils he mentions are sporadic and unusual, and largely in the past.

GEORGE F. BOWERMAN, Librarian.

The Public Library, Washington, D. C., March 21.

EFFECTS OF LARGE GIFTS.

TO THE EDITOR OF THE NATION:

SIR: Three recent benefactions must provoke thoughtful men to look deeply into the conditions that made such gifts possible, and the results of the gifts. I refer to Mr. Carnegie's $10,000,000 for pensioning teachers, Mr. Rockefeller's $32,000,000 for the use of the General Education Board, and Mrs. Sage's $10,000,000 for social betterment. The Carnegie and Rockefeller gifts would have been impossible had our laws been righteous and fairly administered. The tariff made it possible for Mr. Carnegie to pile up scores of millions in the manufacture of iron and steel; and secret and illegal freight rates, and a wholesale system of corruption, made the Standard Oil Company the fat monopoly that it is. It is true that Mr. Carnegie's wealth was acquired within the pale of the law, while some at least of Mr. Rockefeller's was not. Having no definite knowledge of the sources of Mr. Sage's wealth, I do not consider it from that point of view; but, in looking at the results of the gifts, we may include Mrs. Sage's with the other two.

Although the immediate good may be great, the ultimate result can be but deplorable. According to the very foundation principles of our government, the providing of education and the remuneration of teachers are properly within the province of the people as a whole. With juster laws the wealth of the country would have been more generally distributed, and the people at large better able to respond to the appeals that could and would have been made for better school facilities and larger salaries for teachers. This is particularly true of the South, where less money for education comes from the people than in almost any other section of the country. All of these gifts, and others of a similar nature, have a tendency to deaden the people to a sense of responsibility for their brothers; and to put them in the attitude of holding out pitiful hands for the largesses of the very rich—these largesses, in consequence of favoritism in legislation and a breaking of law with impunity, having been first wrung from the toilers.

G. S. W.

Greensboro, N. C., March 15.

Notes.

The Royal Society of Literature is about to publish, through Henry Frowde, Coleridge's "Christabel," with facsimile of the MS., and with notes by Ernest Hartley Coleridge. A good deal of illustrative material will be added.

Walter Sichel, who has already made a name for himself as a biographer, is writing a life of Richard Brinsley Sheridan, for which he has obtained a large amount of new material from the Sheridan family.

The volumes of the World's Classics published by Henry Frowde succeed one another so rapidly that it is difficult to keep up with them. The latest parcel includes "The Poems of Thomas Hood," "The Pickwick Papers" (2 vols.), Mrs. Gaskell's "Cranford," Douglas Jerrold's "Mrs. Caudle's Curtain Lectures," and, most valuable of all because least easy to get in cheap form, Dr. John Brown's ever delightful "Horæ Subsecivæ." Austin Dobson furnishes the Introduction to the last-named.

There might seem to be something incongruous in the junction of the names of Browning and Arthur Symons, but it was in writing a book about this poet that Mr. Symons—so he says—first learned the art of criticism; and now, in his more mature years, he has largely rewritten this youthful study and republished it as "An Introduction to the Study of Browning" (E. P. Dutton & Co.). The work received the commendation of Walter Pater and of Browning himself.

The coming of Mr. Bryce to this country makes opportune the issue of a new edition of his admirable "Studies in History and Jurisprudence," first published in 1901 (two vols., Henry Frowde).

"Who's Who in New York City and State" now appears in a third edition for 1907 (L. R. Hamersly & Co.). This useful supplement to the national "Who's Who" reaches to nearly fourteen hundred pages, yet we note the omission of several names here which nevertheless find a place in the general work.

Professor Breasted's monumental "Ancient Records of Egypt" was fully reviewed in the *Nation* of December 27. The value of the work has been much increased by the publication of a fifth volume containing complete indices (University of Chicago Press).

There are not to be found many original records on the history of the Continental navy during the Revolution. The first ventures of ships were generally successful, but the control of the sea by Great Britain soon restricted their activity, and made privateering so much more profitable that even Washington and members of Congress were concerned in some expeditions. It is impossible not to connect the history of the naval vessels with that of letters of marque; and it would not be improper to include the record of the trading ventures of the Continent, made under cover of the firm of Willing, Morris & Co., did the documents still exist. It is among the papers of the Continental Congress that the fragments must be sought, and the Library of Congress, now the custodian of those papers, issues a calendar of the "Naval Records of the American Revolution" prepared by Charles H. Lincoln. The most valuable source is the letter book of the Marine Committee, and the reports of special committees, with the memorials and petitions laid before them. Hopkins's removal from command is an important incident, and Jones figures largely in the later years. Unfortunately the rosters of the vessels and their logs were not preserved. More than half of this volume is occupied by a list of the bonds filed under the letters of marque, in which are indicated all who were concerned in the vessels, as master, bonder, owner, or witness. This is a valuable contribution to history, as the bonds also give the nature of the ship, and the size of crew and armament, as well as the State to which she belonged. It will now be possible for investigators to identify the ship, and from local records trace her performances. The Committee on Appeals left no records, but the experience of the privateersman in the case of Our Lady of Mount Carmel proves his difficulties in securing the benefits of his capture. A full index makes this volume serviceable; but we note some obvious misprints of names.

Biographies of public men who have published their reminiscences are obviously hard to write. Unless a considerable amount of new and significant material is available, one is shut up practically to the alternatives of restating, in more systematic or artistic form, what the subject of the biography has already said about himself, or else of making the man the nominal centre of a condensed history of the time. Theodore E. Burton, whose "John Sherman" forms the latest volume of the second series of American Statesmen (Houghton, Mifflin & Co.), has chosen the latter method. With a man who, like Sherman, lived, moved, and had his being in congresses and cabinets, and whose range of intellectual interests was extremely narrow, no other method, perhaps, was possible; but the book has little of the usual

human interest of biography. To future generations, as to his own, Sherman will be known as one of the ablest of American financiers, the chief agent in bringing about the resumption of specie payments, and the framer of notable anti-trust and silver-purchase laws. He knew the Republican party from its birth, and was for the most part a thick-and-thin defender of its policy and creed; but he drew back from "expansion" and furnished some effective ammunition for the Anti-Imperialists. His disregard for consistency, indeed, more than once exposed him to attack, though it does not seem ever seriously to have weakened his influence. During the last years of his public career his utterances on questions of finance carried more weight, probably, than those of any other public man. Mr. Burton's plain and unimpassioned style does little to make Sherman interesting, and his book will not, we fancy, be much read except for reference; but he deserves praise for the conscientious thoroughness with which he has traced Sherman's official career, and for his evident reliance upon documentary sources rather than upon Sherman's hastily written and often inaccurate "Recollections."

"East of Suez" (The Century Company), by the well-known diplomatist, traveller, and author, Frederic C. Penfield, is mainly a series of detached sketches of interesting places in Ceylon, India, and China. Most of these spots are familiar, but described from his point of view in an attractive, often humorous, way, they acquire a fresh interest. An out-of-the-way trip, however, was that to the famous Ceylon pearling grounds, where, during the short fishing season, Marichchikkaddi, a town of forty thousand inhabitants, springs up on the desert strand. Built entirely of palm and rattan are bungalows, courthouse, treasury, hospital, prison, telegraph office, post office, and administration building. In this isolated spot, "hours from anywhere by sea, and shut off from the large towns of the island by jungle and forest, wherein elephants, leopards, and other wild animals roam, twelve or fifteen Britons rule, with an authority never challenged, more than forty thousand adventurous Asiatics." Still more remarkable perhaps is the fact that the health of the community is so well cared for—tons of disinfectants being used—that the deaths in a recent season were only thirty-two, though malarial fever is ever present. Among the other places described are the shrine of Buddha at Kandy, the palace of the Maharajah of Jeypore, Benares with its multitude of pilgrims and their religious rites, the Taj Mahal at Agra, Canton, and Macao, the Monte Carlo of the East. The book is not, however, wholly devoted to accounts of places which Mr. Penfield has visited. In the opening chapter, "The World's Turnstile at Suez," he gives many useful facts relating to the history of the canal and its commerce, to which is appended a discussion of some of the problems connected with the Panama Canal. He also devotes a chapter to the way in which the Kaiser, whom he styles the Trade Lord, is endeavoring to absorb the foreign trade of China for Germany. He closes his book with a characterization of Japan's commercial future and some hints as to how the United States should coöperate with her in securing the trade of the Far East. Fifty-five illustrations from drawings and photographs add to the value and charm of the book.

A second edition, somewhat revised and enlarged, of the Rev. Robert John Floody's "Scientific Basis of Sabbath and Sunday" is equipped with a commendatory introduction by President G. Stanley Hall (Boston: Herbert B. Turner Co.). Mr. Floody has had practical interests in mind in his study of the origin of the Jewish Sabbath and the evolution of the Christian Lord's Day, and his suggestions are in the line of enlightenced common-sense.

A study of Jewish Messianic belief, from the Jewish point of view, has been prepared by Julius H. Greenstone, "The Messiah Idea in Jewish History" (Philadelphia: The Jewish Publication Society of America). Special attention has been paid to the Talmudic and Midrashic sources, to Jewish philosophers of mediæval times, and to the Kabbalistic writings. In his treatment of the Biblical period Mr. Greenstone has relied largely upon Christian scholars, and has employed freely the German literature on the subject.

Fasquelle will soon publish for Maurice Maeterlinck a new volume entitled "L'Intelligence des Bêtes et autres essais." He has also just finished a four-act drama on an episode of the Revolution, which he has not yet named.

Under pressure of the conflict between German and Danish nationalism in Schleswig a group of Danish societies publish a "Manuel historique de la question du Slesvig" (Copenhagen). The volume is handsome, and well supplied with maps and illustrations; it sets out the history of the Danish population in Schleswig with great wealth of detail, especially on the statistical side. Since it appeared, however, has come the sudden *volte-face* in German policy towards the Danish Schleswickers, perhaps a move in the suspected campaign of German diplomacy for closing the Baltic. The children of the Schleswickers who after the war of 1864 chose Danish nationality are to be given their vote for the Reichstag, and thereby the controversy that called this book into existence is, for the present, settled. The "Manuel" deals incidentally only with the greater question of Schleswig-Holstein, that agitated Europe so much between 1846 and 1866. In regard to any wider significance that the present Schleswig settlement may bear, it may not be out of place to recall a dictum of Bismarck's in October, 1864, that the restitution of northern Schleswig to Denmark would not be a great misfortune.

The German Orient-Gesellschaft has just published a colored plate representing the results of its researches, in the shape of a reconstruction of the Egyptian pyramids in the vicinity of the ancient city of Memphis. The plate is the work of the leader in this work, Prof. L. Borchardt, and is published by Georg Büxenstein & Co. in three colors.

The annual report of the Columbia University Press shows that in the twelve years of its activity the concern has sold 20,737 volumes, representing sixty-five publications. Announcement is made of nineteen volumes, to appear in the next two years. Of these, ten are to be the result of lecture courses at the university. In the list are the current lectures on "Party Government in the United States," by Dr. Woodrow Wilson; next year's courses on the Blumenthal foundation, to be delivered by Representative Samuel W. McCall of Massachusetts, and Prof. Jeremiah W. Jenks of Cornell; "Law and Its Relation to History," lectures delivered at the university in 1904, by James Bryce; and "The Republics of South America and Their Contributions to Culture," by Dr. William R. Shepherd.

Journalism is being added to the courses at the University of Heidelberg for the first time during the coming summer semester. Prof. Adolf Koch announces a course on the history, character, and importance of public opinion as expressed through the journalism of Germany; and, secondly, practical exercises in newspaper work.

The education of the Afghans on modern lines seems to be assured, thanks to the efforts of its enlightened Ameer, notwithstanding the opposition of his obscurantist nobles. Referring to this, he said to them in open Durbar: "I know you are all against me in the work of introducing modern education in Afghanistan. But I have determined and formed a plan, and now I will see who succeeds—I in educating you, or you in resisting my efforts in that work." By his orders the city of Kabul has been divided into forty school districts each having a primary school, from which the pupils will gradually pass to middle and high schools and from thence to the Habeebiah College, lately founded by his order. His scheme includes the establishment of technical schools for industrial instruction and a medical school, the text-books for which are now in course of translation into Persian. A special course of instruction is being provided for promising young men selected to be sent to Europe or to Japan at the cost of the State for the study of law, medicine, and other pursuits.

Constantine Petrovitch Pobiedonostseff, ex-procurator-general of the Holy Synod of Russia, who died on Saturday at the age of eighty, was the son of a professor of Russian literature in the University of Moscow. In addition to his political and legal responsibilities, Pobiedonostseff won for himself considerable reputation as a scholar and writer. From 1860 to 1875 he occupied the chair of Russian civil law in the University of Moscow. In 1868 he published a series of lectures entitled "Course in Civil Law." This was immediately recognized as a standard work, and continues to be the authoritative treatise on the theory and practice of Russian law.

The death is announced of three well-known philologists: Karl Dilthey, Professor of Classic Archæology at Göttingen; Antonio Ceriani, Prefect of the Biblioteca Ambrosiana, an eminent Orientalist, and Friedrich Blass, of the University of Halle.

In the death of Blass classical philology has lost one of its most stalwart supporters. His life was in the mould of the great tradition. Born at Osnabrück, in 1843, he studied at Göttingen and Bonn, and was then for a number of years connected with various gymnasia. In 1881 he was called to

Kiel, and in 1892 proceeded to Halle, where his death occurred. Fame came to him early. His "Griechische Beredsamkeit in dem Zeitraum von Alexander bis auf Augustus," published in 1865, was immediately accepted as a standard work, and this was followed (1868-1880) by "Die attische Beredsamkeit." These studies in the orators led to his "Aussprache des Griechischen" (1870), and "Die Rhythmen der attischen Kunstprose" (1901). In the last-named work he seemed to many to fall into the common German error of allowing his erudition to run away with his common sense. Others, however, see in this study of prose rhythms the key to the much-debated mysteries of Greek prosody. But these publications did not exhaust Blass's activity. He labored for years in the field of New Testament linguistics, and was one of the most diligent students of the Greek papyri from Egypt. He was somewhat ungainly in appearance, but at heart a gentleman of the utmost simplicity and refinement. He will be much regretted as a scholar and as a friend.

STUDIES IN PHILOSOPHY.

The Political Thought of Plato and Aristotle. By E. Barker. New York: G. P. Putnam's Sons.

The writings of Plato and Aristotle are already almost buried under the exegesis of twenty-two centuries, and it might seem that there was little left for the twenty-third century to say. But apart from the fact that every generation must reinterpret great books for itself, progress in the elimination of error and the compact statement of established truth may continue long after the exhaustion of all permutations and combinations of ingenious hypothesis and erudite commentary. Such progress is distinctly discernible in the newest Platonic and Aristotelian "literature," and though we may not dignify it by the name of science, we cannot dismiss it as mere scholasticism. Mr. Barker's "Political Thought of Plato and Aristotle" contains, perhaps, no facts and few ideas not to be found in Newman's "Introduction to the Politics," in Henkel's "Studien zur Geschichte der Griechischen Lehre vom Staat," in Warde Fowler's "City State," in Nohle's "Staats Lehre Platons" (which Mr. Barker seems to have overlooked), in the writings of Zeller, Wilamowitz, and Gomperz, and in the various commentaries on the "Republic," the "Ethics" and the "Politics" which he has consulted. But he gives us something which few readers could find in any or all of these books—a lucid, sane, and rightly proportioned presentation of the entire subject, scholarly but free from excess of erudition and extravagance of hypothesis, philosophical but not expressed in equivocal Hegelian verbosity or pseudo-scientific sociological terminology, apt and suggestive in the use of modern illustrations without strained and fantastic analogies. There is no other book on the subject to which the intelligent layman may be so confidently referred, none which the authors of general histories of political theory may so safely follow.

The political and ethical thought of the Greeks is not, like their physics, superseded by modern science. Our experience is wider than theirs. But theirs was more intensely felt, more vividly and distinctly apprehended in its typical significance, and, as every reader of Thucydides and Demosthenes must perceive, more completely predigested in popular discussion for the final elaborations of philosophical reflection. Lowell lecturing on Democracy in England was quite serious when he said:

> He who has read his Aristotle will be apt to think that observation has on most points of general applicability said its last word, and he who has mounted the tower of Plato to look abroad from it will never hope to climb another with so lofty a vantage of speculation.

Prof. George Santayana intends no petulant paradox by the assertion that the ethics of Aristotle are final when supplemented and enriched by Plato. The sobriety of Mr. Barker does not go quite so far as this. He is well aware and constantly reminds us of the differences between the Hellenic city-state ruled by an assembly of all its freemen and the huge modern nations made possible by representative government and steam. "From the theory of the city-state," he tells us, "philosophy leapt to a theory of the world-state. From the theory of the world-state it has turned back in modern times to that of a nation-state. Yet through all its mutations it has retained a fundamental unity. Even if Greek philosophy is a philosophy of the Greek and for the Greek, yet the Greek was a man and his city was a state, and the theory of the Greek and his πόλις is in all its essentials a theory of man and the state—a theory which is always true."

The plan of the book is simple. About sixty pages are devoted to the Introduction and to the scanty remains of pre-Platonic thought. In the hundred and fifty pages given to Plato the ethico-political thought of the minor dialogues is skilfully summarized, the ideals and the essential significance of the "Republic" are presented in their true proportions with tactful omission of irrelevant detail; and supplementary chapters sufficiently explain the new suggestions or altered emphasis of the "Politicus" and the "Laws." The excellent chapter on Aristotle's Life and Times incorporates the best parts of Wilamowitz's brilliant essay in "Aristoteles und Athen," gives, mainly after Eucken, a good characterization of Aristotle's method, and tells the student all that he needs to know about the composition and text of the "Politics." Mr. Barker holds that the work as we have it is the Roman edition, with interpolated cross-references, of the author's notes for at least three separate courses of lectures. Of these only the two books on the ideal state (seven and eight) were composed with any care for style. Their natural place is immediately following the three introductory books on general political theory, and preceding books four, five, and six, which deal with the pathology of existing constitutions. In this distribution Mr. Barker studies the work through two hundred and thirty pages, judiciously blending analysis of the content with disquisition on its historical or typical significance. An epilogue sketches the history of the "Politics" to the end of the eighteenth century; and an appendix outlines still more briefly the history of the "Republic" down to More's "Utopia."

The earlier chapters of the book can be little more than an illustration of the truism that "the 'Republic' is much indebted to the seething of opinion which characterized the end of the fifth century at Athens." Mr. Barker's usual caution deserts him when he accepts as proved Dümmler's "discovery" that Euripides in his "Supplices" and "Orestes" is following a particular political pamphlet which modern ingenuity may reconstruct with the aid of Platonic parallels. There doubtless may have been many such pamphlets preceding or contemporaneous with the earliest extant piece of Attic prose, the Pseudo-Xenophontic "Constitution of Athens." But it is neither provable nor probable that Euripides took any one such pamphlet for his "source." His inspiration was the atmosphere of the Athens of Pericles and the Peloponnesian war. The very analogy adduced by Mr. Barker fails him. For it is by no means established that Euripides did versify the physics of Anaxagoras rather than that of Diogenes of Apollonia, or his general impression of the Pre-Socratics.

The chapter on Socrates is soberer than Gomperz, as Gomperz is soberer than most. But even so, more is affirmed than we know. The illusion persists that Xenophon could not tell a lie because he could not romance so charmingly as Plato did. The anti-democratic demand for special knowledge and efficiency in the statesman and the analogies of the scientific pilot, the physician, and the true shepherd, being common to all the Socratics, may go back to the master. But we cannot attribute to him the classification of governments which Xenophon extemporizes to show that he too has a philosophy of politics. Nor is it likely that Socrates, whose youth was passed in the Athens of Aristides, anticipated the reactionary pessimism of the generation whose first impressions of democracy were received from the post-Periclean demagogues.

The treatment of Plato is excellent. Slight changes in emphasis or point of view from dialogue to dialogue are noticed. But they are not made the pretext for carping Aristotelian criticism or for fantastic hypotheses as to Plato's development. The "Republic" is not pedantically scrutinized paragraph by paragraph, as if it were a bill on its way through Parliament, but is expounded as a work of imaginative art, embodying a few great ideas. Mr. Barker appreciates the true significance of Plato's far-reaching anti-democratic principle of specialization, and its logical connection with the severe training and enforced ascetic communism of the ruling class. As he well puts it, modern socialism "demands an equal division of material goods, for the sake of an equal diffusion of material happiness. Plato demands an equal abnegation of material goods, for the sake of that ideal happiness which comes from the true fulfilment of function." It would have been well to insist still more on the fact that this abnegation is confined to the rulers, and that in general the paradoxes of the "Republic" are designed to emphasize, if not to realize, the ideal postulate of all serious political philosophy, the combination of efficiency with disinterestedness. It is perhaps true "that it is not unjust to criticise the theoretic exhibition of a state based on ideal principles upon the ground that these principles are in

their application pushed to an excess." And there is doubtless for the majority of modern readers "something French in Plato's mind, something of that pushing of a principle to its logical extremes which distinguished Calvin in theology and Rousseau in politics." Yet closer scrutiny will generally discern that Plato himself has forestalled criticism by timely qualifications, explicit caveats, and self-directed irony. It is not quite fair, without such qualification, to say that Plato is hostile to law, and that his ideal is the absolute rule of the efficient man. Throughout his life he preached law to a lawless generation. Even in the "Republic" the guardians are tested by their devotion to the laws. And in the "Politicus" he goes so far in this direction that Mr. Barker, forgetting his former criticism, and forgetting explicit statements in the "Laws," tells us that "Plato's standard of classification is respect for law; and Aristotle is original in his use of a teleological standard, and of the criterion furnished by the differences between governments in the spirit of their rule." The fact is, that while preaching respect for law as the one gospel of salvation for Athens, Plato could not forbear to point out as a matter of pure theory that impersonal law is at best an imperfect substitute for the flexibility of absolute and disinterested intelligence—could we only find it. This line of defence, however, leads straight to the dogma of Platonic infallibility, which, though true enough, humanly speaking, of Plato, the artist and dialectician, would prove as misleading to the student as is the prevailing habit of captious criticism. And so we may cordially accept Mr. Barker's conclusion of the whole matter:

> Much may be criticised; yet the staple of criticism is simply this, that he [Plato] was too generously eager for the reign of pure truth and the realization of pure principle.

Reason, Thought, and Language; or The Many and the One. By Douglas Macleane. New York: Henry Frowde. $6.

According to Kuno Fischer, there are two things which the philosopher cannot neglect except at his peril: one is the "Organon" of Aristotle; the other, Kant's "Critique of Pure Reason." In this treatise on formal logic the author has certainly not neglected the "Organon." His work is rather a restatement and a defence of traditional doctrines. It is significant that this should come from Oxford, for it shows a reaction against the extreme views of critics like Bradley and others, who have exposed so many weak points in the theories of the older logicians. Mr. Macleane rejects the psychology of the Associational school, and insists that reasoning is an active function of mind. According to him, however, all thought is reasoning: "thought without a middle term is at a standstill." Even "immediate inference" implies the universal. But here the author seems to confuse the mediate inference by which a rule is established with the practical application of the rule itself.

In so far as it deals with logic as an art, Mr. Macleane's book will be useful for reference, even if it is too long and discursive for the class-room. There is an almost embarrassing wealth of illustration, showing much careful reading, and there are admirable expositions of the syllogistic figures, of algebraic logic, and of that modern and cumbersome addition to the science, known as the quantification of the predicate.

There has been some danger that captious criticism by the anti-Aristotelians might impair the usefulness of formal logic as an academic discipline, and Mr. Macleane's treatise is corrective of the prevalent skepticism. But, in his discussion of extra-logical subjects, he is not always convincing. He holds, for example—and the dogmatic error is apparent—that logical necessity is prior to every other form of necessity, that "the notion of it is necessary in itself, as well as necessarily formed by our minds"; and he declares that the logician's starting point is "the reality of truth itself"; whereas it is the necessity not the reality of truth which is fundamental to logical science. His doctrine of the reason, as presented psychologically, reveals an adherence to the old "faculty psychology," and reminds one of the Coleridgian period of British thought. He attributes error not to thought, but to the will which is "the parent of laziness from prejudice, confusion, arbitrary assumption, and that inattention to the limitation of our faculties which converts nescience and suspended judgment into ignorance and error." While Mr. Macleane defends the principle of contradiction effectively against the objections of the new logicians, he misapprehends the meaning of "sufficient reason," maintaining with Schopenhauer and others that there is a sufficient reason of "being." Like the law of causation, this principle is applicable only to changes; for being as such has no sufficient reason. The premises of a syllogism are not a reason for the fact stated in the conclusion, but only for the inference drawn.

It is to be regretted that Mr. Macleane did not append to his interesting treatise examples of fallacies in deductive reasoning. His wide reading has given him unusual opportunities for making such a collection, which would have been a great aid to all teachers of logic.

CURRENT FICTION.

Felicity. By Clara E. Laughlin. New York: Charles Scribner's Sons.

The merits of this book lie largely in its freedom from the usual features of the theatrical novel. Though it concerns itself with "The Making of a Comédienne," there is neither over-exaltation of the artist life nor over-insistence on its sordid side. Stage-folk are neither saints nor monsters, but have their faults and virtues like us others. If their manners and customs are more or less fashioned by the inverted demands of sunlight and electricity, their souls after all dwell neither in the aloofness of genius nor yet in the dungeons of depravity. The book may not be taxed with the twaddle of rhapsody nor the cheapness of melodrama; and this is perhaps more than a negative merit in a book dealing with stage life.

Aside from this it is a somewhat elementary story of a young woman, who rose by native gifts and special privileges of training to the height of her profession, and found that public success is a very lonely sort of affair. The story is rather of the effect of the stage on Felicity than of her career on the stage. She is shown as an absolutely successful artist, an attractive woman, yet a self-pitier, till life has widened her vision. "The Old Man," her master, who is the guardian spirit of the story even after his death has withdrawn him from its pages, is a world-favorite in comedy, but his maxims are less often of stage-craft than of the vagabond life of the open road. Neither he nor Felicity is avowedly biographic, but dates and places are given with minuteness; and there are positively objectionable local luggings-in, such as comment ascribed to "The Dean of American Critics," and Joseph Jefferson unburdening his mind to Felicity at the Eden Musée. There is no valuable art-criticism, but a certain amount of footlights and green-room chat, and a good deal of sound, homely criticism of life. If there are those nowadays who need to learn that the matinée idol may be a harmless fellow, with an ambition to "do the decent thing," or that the leading lady may combine intense passion for portrayal with a real liking for making pie, this is the book for them.

Frost and Friendship. By George Frederic Turner. Boston: Little, Brown & Co.

Yet again history repeats itself in the matter of the doughty and casual Englishman who is called upon to divert himself, during a holiday, by rearranging the affairs of a sister kingdom. The "Prisoner of Zenda" was an ancient fairy-tale pleasantly done in modern costume—stage costume. The horns of elfland echo more faintly in later experiments of the kind, as the voice of the prompter becomes more clearly audible in the wings. However, not to break a butterfly upon a wheel, we make haste to say that the present narrative proceeds smoothly and amusingly upon its premises, *i. e.*, that there are quaint little principalities lying about in odd corners of Europe, more or less impatient for the transforming, if momentary, presence of some Englishman—any Englishman. From the gracious hour in which our linen-draper arrives at the court of Grimland (not in a business way, but as the invited guest of royalty), he becomes your only *deus ex machina* in Grimland affairs. It is for him to foil the plot against the sacred if flabby person of the King; for him to become, at the shortest possible notice, the champion tobogganer and curler of the realm; for him to win but not requite the affections of a queen, not to speak of the usual princess. He prefers the royal governess, not so much because she is his nearest athletic competitor, as because she is an indubitable fellow-Briton. And, having done their duty by the foreigner, home they post to domestic life and the linen-drapery. Winter sport supplies the distinguishing feature of the fable, many important events turning upon the "negotiation" of a certain perilous toboggan run.

The Lonely Lady of Grosvenor Square. By Mrs. Henry de la Pasture. New York: E. P. Dutton & Co.

The Sweetest Solace. By John Randal. New York: E. P. Dutton & Co.

The day of Black and Besant being over, innocent persons in search of pleasant fiction are hard put to it at times to find

anything worth their trouble. To such persons we cheerfully recommend the mild adventures of the lonely lady from the country who becomes the reluctant mistress of a great London house. Of course she is of noble descent, though she chances to have been reared in a Welsh village. Of course she finds herself snubbed by smart people and patronized by knowing servants, and eventually triumphs over them to more than her gentle heart's satisfaction. And not unnaturally there is a fairy duke, who conceives a project for relieving, and in fact annihilating, the loneliness in question.

From the same publisher comes another story of the same type, though distinctly feebler. Here are two lonely ladies in an English square. They also are from the provinces; they also are highly connected. They also have a fortune coming to them unexpectedly. One of them is even awarded a duke, though the other has to put up with a mere M. P.

Prisoners of Fortune. By Reuel Perley Smith. Boston: L. C. Page & Co.

A pirate tale of the Massachusetts Bay Colony, narrated with a garrulous simplicity suggestive of the manner of Mr. John Ridd of Exmoor. Like John Ridd, the narrator is supposed to be setting down in old age the record of his youthful adventures. His band of pirates with the lone maiden, who is supposed to be related to the chief but turns out to be a captive, naturally recalls the Doones and their Lorna. Here, however, the gift of marvellous stature and strength is apportioned to a second person, an act of noteworthy magnanimity on the author's part. Substitute an island off the Maine coast for the guarded Doone Valley, and you have a neat parallel of which the writer was no doubt unaware. The action is supposed to take place during the last years of flourishing piracy in the colonial waters. Pirate gold is involved, to be discovered at length by means of an oracular jingle and much pure luck. Then the rescue of the maiden and happiness ever after.

The Bird of Time. By Mrs. Wilson Woodrow. New York: McClure, Phillips & Co.

Often since the days of the classic "Friends in Council" have groups of witty, beautiful, and clever men and women met out of doors or in front of hospitable fires, exchanging views on Shakespeare and the musical glasses and all the topics that lie between. "Friends of the Soul" in such circumstances always speak the same language—the language of mutual understanding—however piquantly opposed their attitudes may be, nay, must be. They have always read the same books and can follow each other's quotations (no sinecure in the present case). Mrs. Woodrow's book, sub-entitled "Conversations with Egeria," is made on this time-approved plan, and is a very agreeable blending of ancient and modern. Sitting with Egeria and her friends in her "sweet, sedate, secluded" garden, or around her birchwood fires, the reader may hear much good talk on subjects as old as the story of Joseph and as new as the balefulness of woman's economic dependence.

The subject oftenest under consideration is even older than Joseph—that of woman. Talked over once again, and freshly, it must be granted, are her head, her heart, her hand (both industrial and matrimonial), her logic, her charm, her development, her destiny. Even her clothes are glanced at, and, of course, what she likes to read and how she plays bridge. From the Eternities to Blouses the chatting ranges. It is much to say that it is all entertaining, sane and stimulating. Once or twice there steals over the reader the sense of having been drawn into a lecture course of economics. When Egeria belabors women who will not abandon clerical positions and make neckwear, there comes a horrid memory of what the writer herself calls "that bar sinister of the feminine intellect—the woman's page." A pretty wisp of story binds all the parts together. A book by a woman largely about "us women" naturally contains a good deal about "you men." But never does it fall into the humor-lacking acridities of its class. Many writers have done well, but this one has all the attraction of being *mieux femme que les autres.* The proof-reading leaves very much to be desired. Who to dumb forgetfulness a prey can endure a Bible "Sampson"?

The First Claim. By M. Hamilton. New York: Doubleday, Page & Co.

This is the story of a woman who, having made in extreme youth an uncongenial marriage, is tempted beyond withstanding to skip blithely away with a young subaltern, Charley Osborne, less from love of him than from aversion to her husband. Unluckily, in leaving this elderly and repugnant person she is obliged to leave as well a two-year-old child, whom, though she adores, she has not been able to enjoy because of the prohibitive attitudes of a stern mother-in-law and an ultra-competent nurse. Five years later she hears that her child is receiving ill-treatment at the hands of its new step-mother, and all her thwarted mother feeling awakes, goading her towards the recovery of her little daughter. Valerie's character is very well drawn, with never too heavy a touch. Half sweetness, half vacillation, she develops on the stronger side as the needs of her little girl make more and more painful appeal to her. Yet she never succeeds in being wise, for she has Osborne to consider—Osborne, who has married her, and who has always remained the soul of chivalry. The conflict of claims is the motive of the story, and the moralist may look for his innings in the fact that the two are irreconcilable. The ending in a ghastly triumph of falsehood makes an unsatisfying conclusion to a story of struggle not without genuine power.

Primitive and Mediæval Japanese Texts, Romanized and Translated into English by F. V. Dickins. 2 vols. New York: Henry Frowde. $6.75.

The un-Mongolian islanders of Nippon, who, in historical development, in physique, in language, and in the cast and working of their minds, differ from their Asian Continental neighbors, are here in their ancient literature seen living and enjoying nature before the advent of Mongolian influences, or of the Aryan religion founded by Buddha. Throughout the stream of the known history until the present time, Japanese poetry suffers no admixture of Chinese or alien elements. These crystals of thought expel in the very process of formation every foreign element. As with all great races of mankind, the earliest recorded utterances of the Japanese are poetical. The poems of the *Manyoshiu* (Myriad Leaves, literally, but only 264 in number) antedating the use of Chinese letters or writing, picture also a comparatively small portion of what is now the Japanese Empire—that is, the Yamato, or Kioto-Osaka, region. Some distant places, of course, such as frontier posts, are known, but China and Korea are beyond the ken of these early poets. These lands to the westward come into view toward the end of the period, in the sixth century, when the strange sound of continental speech served as the butt for the merriment of the island poet.

Frederick Victor Dickins, long an able lawyer in Japan, who learned his Chinese script in China, won his spurs in 1866 by translating and putting into English metre one hundred of the most famous early poems of Japan. He has now translated with annotations and introductory apparatus, the short poems, the long lays, and the "Story of the Old Bamboo Worker." These he has put into the first of his two volumes, with a full index, and the reproduction of a dozen illustrations in black and white from the old woodcuts by famous native artists. In the second volume we have the texts Romanized, so that one can easily study them with the aid of the grammar, which Mr. Dickins has prefixed. In the appendix, beside a generous glossary, there is a list with definitions of all the "pillow words"—without understanding which, no one can enjoy these exquisite pictures of early Japanese life. While not devoid of meaning, these words are rather to be described as fixed epithets, belonging mainly to the word following them as a verbal decoration, though sometimes necessary to the poem, both in spirit and in form.

Altogether, one has in these two volumes a sufficient apparatus for the study of the mind of pre-Mongolian Japan. It is certain that for a knowledge of real Japanese life, and for institutional if not chronological and political history, these texts exceed in value all other early writings, with the exception of the Kojiki or "Ancient Annals" (712 A. D.), together with the same body of myths and legends encased in borrowed Chinese literary forms and called the Nihongi. Here we have the mirror of a primitive people sensitive to that wonderful beauty of mountain and sea, valley, plain, and river, with all its amazing changes and coloring. Lovers, too, are seen to be much the same as in our day, playing the same tricks, circumventing authority, and finding the same joys. The morality of these poems leaves pretty much everything to be desired. On the other hand, they reflect deep parental affection, Friendship between those in the capital and absentees on the frontier is often exquisitely illustrated, while the eternal feminine lives throughout all.

Those who have enjoyed Prof. B. H. Chamberlain's "Classical Poetry of the Jap-

anese" have now the opportunity to compare the original with Mr. Dickins's literal rendering and Chamberlain's rather free versions and versifications. As Dr. Verbeck once put it, Chamberlain's work may be likened to a Shinto shrine taken to pieces and built up again in the open lawn of an English park, with a goodly proportion of Western taste and elements of beauty and ornamentation introduced into it. In Chamberlain we have archaic conceits dressed out in modern rhetoric and poetic style; in Dickins, simplicity and accuracy without poetic or translator's license. It would be easy perhaps to find fault here and there in Mr. Dickins's unrhymed literal translations; but it is practically impossible to do the original justice in English. He has at any rate succeeded in preserving the climaxes of the Japanese text.

We have said enough to indicate that in the Manyo literature is an untouched world of beauty which will repay the student's exploration. The imagery seems to one acquainted with the fairyland of English poetry frightfully impoverished, for the Japanese language, with rare exceptions, knows not personification. Nevertheless, the verses have a charm of their own, distinct from that of Chinese poetry, while yet nearer to that of Western verse than either the pre-Confucian classic poems or the later products of Japanese literature.

The Diary of a Forty-Niner. Edited by Chauncey L. Canfield. New York and San Francisco: Morgan Shepard Co.

This purports to be the veritable diary of one Alfred T. Jackson, a young Connecticut farmer, who from May, 1850, to June, 1852, mined on Rock Creek, Nevada County, California; and as such is introduced by the "editor" as "a unique contribution to the history of the era." But there are indications that the diary belongs to the class of documents so frequently found by novelists in bottles, custom-house desks, iron chests, and copper cylinders; and that we really have the reminiscences of a pioneer, or of pioneers, thrown into diary form to permit the introduction of unconnected jottings on the yield of the placers, the methods of mining, the price of provisions, and the incidents, humorous and tragic, of life in "the diggings" in "the spring of '50." These details no more give the whole truth as to that unique state of society, where all sorts and conditions of men were drawn together from the four corners of the world by one master-impulse, than do Bret Harte's sketches, of which the editor speaks so disparagingly. But they do present certain phases of a life forever passed, simply, picturesquely, and vividly, and hence, whether diary or reminiscence, have interest and historical value.

But the "compiler," as he terms himself in the epilogue, soon subordinates the incidents to the effect of the unrestrained, open-air life, in the midst of grand mountain scenery, on Jackson himself; the influence of "Pard," an older, abler, better educated, and more experienced man, in emancipating his nature and broadening his mental horizon; and the development of the romance that led him to give up his dream of wedding a prim New England maiden and settling down on a Connecticut farm as soon as he had "made his pile." The diary closes with his departure for San Francisco to marry a French widow, pretty and vivacious, but "straight as a string," whom he had met dealing twenty-one in a Nevada City gambling house. All this is presented with a literary ability that makes some of the editor's foot-notes inept, if not impertinent.

Abyssinia of To-day: An Account of the First Mission sent by the American Government to the Court of the King of Kings (1903-1904). By Robert P. Skinner. New York: Longmans, Green & Co. $3 net.

The object of the American mission to Abyssinia in 1903, of which its head, R. P. Skinner, for the past seven years our consul at Marseilles, tells the story in this book, was to negotiate a commercial treaty. Though our cottons had long formed the most valuable part of the import trade of the country, we never had had official relations with the Government. The possibilities of an increase of trade and the need of safeguarding our existing interests led to the dispatch of this mission. It was a complete success—the treaty was signed, and we have now a consul-general at the capital. Mr. Skinner's party of twenty-nine, mostly naval officers and marines, left the coast on November 17, and was back in just two months, having spent nine days at Adis Ababa, the residence of the Negus. The distance traversed was about a thousand miles, a third being by the French railway from Jibuti, and the remainder by caravan.

The account of the journey is uninteresting, being largely taken up with trivial details. Nor does the author describe in an entertaining manner the lively incidents of the nine days at the capital. This is the more to be regretted as the Emperor Menelik is a striking personage, living amidst strange Afric-European surroundings. At an interview with Mr. Skinner he showed a phenomenal thirst for information:

> He knew of our war with Spain, he knew something of our war with Great Britain, and he had a realization, though vague, of our might and power. . . . He had heard, evidently, a good deal about the President, whose personality interested him much. He knew him to be a sportsman, and hoped that he would one day visit Ethiopia. He wanted to know his age, and how he had come to be President. He wanted to know the length of our great rivers, the altitude of our cities, and he seemed to classify the great variety of facts which he has the habit of thus absorbing, and to bring them out again whenever occasion required.

The humorous side of this interesting man is shown in his answer to a young Haytian, who asked him, as "the greatest black man in the world," to become the honorary president of a society for the amelioration of the negro race:

> Yours is a most excellent idea, my young friend. The negro should be uplifted. I applaud your theory, and I wish you the greatest possible success. But in coming to me to take the leadership, you are knocking at the wrong door, so to speak. You know, I am not a negro at all; I am a Caucasian.

The book contains much information in regard to the country, its people, their history, and religion, but it is simply gathered from easily accessible sources, and is not the result of personal observations. The international question as to the construction of a railway through the country to the Blue Nile, not the White Nile as Mr. Skinner erroneously says, is stated at length, though not very clearly.

A deserved tribute is paid to Professor Littmann of Princeton University for his studies of the Amharic language and literature, and aid given to the mission. Thirty-two reproductions of photographs, including a striking portrait of Menelik, add to the interest and attractiveness of the work.

The True Story of George Eliot in Relation to Adam Bede, Giving the Real Life History of the More Prominent Characters. By William Mottram. Chicago: A. C. McClurg & Co. $1.75 net.

George Eliot's relatives have been biographically mute for so long that it is almost startling to find one of them—Mr. Mottram's mother was an Evans and a first cousin—breaking into print with a title which would seem to cast reflections on other biographers. But evidently no offence is intended, and the reader who picks up the volume in search of a sensation will be sorely disappointed. It is a jumble of family traditions, diffusely written, and displaying a marvellous lack of transition; but it is a genuine production nevertheless, and, with the aid of its many illustrations, gives one a sense of having really been in George Eliot's home country and among the people of whom she wrote. The autobiographic form, which the writer seems not so much to choose as to lapse into, his earnestness and religious phraseology, even a touch now and then of provincialism, as in "it would be in such a year" for "it must have been," all add to the value of his book as document. We see him reading in boyhood "Signs from the Invisible World" "until every hedge-row and hillside is peopled with apparitions," and listening to stories of Mrs. Elizabeth Evans's messages from heaven; and when, having in the meantime himself entered the ministry, he comes upon a wonderful novel in which she walks the earth again as Dinah Morris, that also is something to be "accepted" in a special sense and collated with tradition, its inventions being set down as deviations. Of the author he had merely heard from other members of the family—rumors of Mary Ann's superior education and zeal in housewifery ("her right hand," we are told, "remained larger than her left from the labor of making cheese and butter"), scandalized whispers of her loss of faith and refusal to go to church. He had no personal acquaintance with George Eliot until a later period.

The word *true* would appear, from the subtitle and the tenor of the larger half of the book, to stand in Mr. Mottram's mind for truth as opposed, not to mendacity, but to fiction; but it really covers more than this. Writing at the turn of the tide of George Eliot's popularity, he feels that there are certain current misconceptions about her, and contributes towards their rectification a chapter on "The Marriage with George H. Lewes" and one on "George Eliot's Religion." In the former he gives the story of Lewes's first marriage, adding little, in essentials, to what has been known all along. He refutes

two prevailing myths as to George Eliot's attitude:—the idea, natural enough, but unfounded, that her pleadings for comprehension and for the sacredness of human ties were inspired by remorse; and another notion, the absurd invention of persons who began to exercise the gift of prophecy after her second marriage, that she was tired of Lewes and had maintained only a forced fidelity to him.

In writing of her religion Mr. Mottram finds that "the piety of George Eliot up to 1842 was deeply genuine, without a doubt it was intensely practical, and all engrossing, but it may be questioned whether it was natural and healthy." He notes its decay under the influence of wider knowledge, but insists, not without truth, that "in her darkest hour of unbelief George Eliot was more Christian than she knew"; and he even ventures upon the conjecture, into which we decline to follow him, that, if she had lived long enough, she might have seen the veil lifted with her friend Mr. Myers. We cannot agree with Mr. Mottram in characterizing George Eliot's girlhood religion as "deeply genuine"; it has a crudeness and insincerity from which the religious tone of her family, as Mr. Mottram shows it, is as free as that of her own early books, and which is due simply to the adoption of a religious creed by a mind too immature to sustain its weight. George Eliot's maturity, noticeable from childhood, belonged to her character; her intellect grew slowly and came late to its own. Hence her susceptibility to influences, the faith or unfaith of the minds which attracted her leaving an impress on her own, of which we can trace the successive marks. But the power and habit of analysis is not a ready-made importation from one mind to another. What George Eliot owed first and chiefly to the growth and mellowing within of her ideas was what forms the strength and distinction of her art and thought, the "plenteous flexible sympathy," the attitude of almost timid reverence, with no abandonment of reason, the concentration upon human relations as containing at once the revelation and the working out of a gospel.

Science.

The Cambridge Natural History. Vol. I. New York: The Macmillan Co. $4.25.

The somewhat ambitious attempt of S. F. Harmer and A. E. Shipley of Cambridge University to give the natural history of the animal kingdom in ten large volumes is almost realized with the appearance of the present Volume I. Only the fourth volume of the series remains to be published. The object of the authors is to describe the natural history of animals in the old-fashioned use of that term, in comparison with the more modern development of morphology, physiology, and embryology. On the whole the result has been successful, although the different subjects, in which no less than twenty-five English collaborators have taken part, have been somewhat unequally treated. The special emphasis laid on English types makes these volumes rather local in interest, but this is a slight defect.

The present volume includes four of the lowest groups. The protozoa are treated by Prof. M. M. Hartog of Queen's College, Cork. He records many isolated facts that the teacher will be glad to have at his command, but the amount of space devoted to the newer fields of protozoon parasites is regrettably small; for here the reader might justly expect to find some most interesting data. With this exception the section seems up to date. The sponges are described by Miss Igerna Sollars, lecturer in Newnham College, in a sufficient but rather too detailed manner. The extensive and important group of jelly-fishes, sea-anemones, and hydroids is dealt with by Prof. S. J. Hickson of the Victoria University of Manchester. His treatment is needlessly specialized, and lacks breadth of view and the diagrammatic presentation that this group of all others so well allows. The last group, including the starfishes, sea-urchins, and their allies, is described by Prof. E. W. McBride of McGill University, Montreal, who deals with the group almost entirely from the standpoint of anatomy and classification, and makes his faunal references to English types and not to American ones.

In attempting to bring together within short compass many scattered facts the authors of this and of some of the other volumes have failed both in giving a readable account of the subjects and in distinguishing between what is important and what is trivial. Perhaps natural history recognizes no such distinction; and if not, to adhere to such an antiquated treatment is unfortunate, since other methods in vogue permit presentation of most of the knowledge in more readable form. If, on the other hand, the editors intend only to bring together the best ascertained facts in each group, a far better arrangement of material would seem possible. After all, the main fault, from our point of view, is that no one of the present authors has shown himself capable of treating his material with the hand of a master. This is the more to be regretted since the articles of the "Encyclopædia Britannica" show that Englishmen can cover the ground in masterly fashion.

The Wonders of the Colorado Desert. By George Wharton James. 2 vols. Boston: Little, Brown & Co. $5 net.

To those who have experienced the joys and mysteries of a great desert, the sight of these two volumes, bound in desert colors of gray and blue, brings a thrill of delight. A glance at the table of contents provokes the question how comprehensive treatment of such a large subject could be condensed into these two volumes. Actual perusal, however, inspires a wish that the author had limited his field and compressed his material into one volume. There is no doubt of the enthusiasm which Mr. James possesses for the Colorado Desert, which, by the way, is situated in Southern California, but he should remember that a plethora of superlatives only weakens a eulogy.

Of the two volumes, the first is by far the better, and it is the more deserving of its title, since here the author concerns himself chiefly with natural wonders. As might be expected in a comprehensive work, written by one man, there is a decided lack of balance; the most cursory reader will at once perceive that geography, geology, and ethnology are the main interests of the author. In the chapters devoted to these subjects he is at his best; and it is a pleasure to see through his eyes the beauties of mountain, canyon, sand, and oasis, and to follow his excellent account of the past physical history of the desert. Plant life is well described, but in a more superficial way. Most open to censure is the treatment of zoölogical matter, from mountain lions to beetles. This phase of the subject deserves far more than the sixty pages of fact, largely adulterated with fable and trivial incident, which is allotted to it. Since, to use his own words, Mr. James is "neither zoölogist, ornithologist, nor hunter," he would have been wise to ignore zoölogical subjects altogether. He states, for example, that the mountain lion "has a maximum length of eleven feet from head to tip of tail," whereas in truth the largest ever measured in the flesh was eight feet even. It can, no doubt, "leap fifty feet at a jump" from a tall tree or a precipice, but on the ground fifteen horizontal feet is near its limit. The account of the mountain sheep, quoted from Alfonso de Benavides, instead of being the "best, for a short popular account," could not well be worse or more untruthful. The first half of volume two treats in considerable detail the relation of civilized man to the desert—his irrigation, mines, and sanitariums—and affords much valuable information. The latter half, narrating the various trips, is interesting, but repeats facts described in the first volume.

It is a pity that the text should be so atrociously illustrated. The "cowboy artist," whose three hundred pen-and-ink sketches are reproduced, should have stuck to cow-punching. In the case of figures of men, animals and birds his drawings are but caricatures. The all too few photographs are the only true pictorial aids.

A first summary report has been presented to the Académie des Sciences concerning the recent excavations in the Grimaldi grottoes, principality of Monaco. These caverns open behind the cliff just where it plunges abruptly into the Mediterranean. The bones of men and animals, rudimentary tools and other objects which have been discovered belong to a torrid epoch anterior to the glacial period. They seem to be the earliest remains yet found of prehistoric man, at least in such quantity; and the palæontology of the period to which they belong is also little known. The animals were naturally without the fur of the mammoths, woolly rhinoceros, and reindeer inhabiting this coast at a later period. France was then the habitat of the elephas antiquus, the hippopotamus, smooth-skinned rhinoceros, and giant deer. The human skeletons are of the negroid type, approaching simians more closely than the prehistoric men hitherto known. Their dentition is almost identical with that of the Australian aborigines of our day. The tools, made of bone, comprise needles and whistles. There are a few fragments of mural painting. The excavations were made by the Chanoine de Villeneuve and

M. Lorenzi. The human skeletons have been studied by Profs. H. Verneau and H. Boule of the Muséum (Jardin des Plantes), and the tools by Prof. L. Capitan of the Paris École d'Anthropologie and Émile Rivière, who have devoted themselves so specially to caves having mural paintings. Émile Cartailhac has classified these objects for the Musée d'Anthropologie created by Prince Albert at Monaco. The report was presented to the Academy by Armand Gaudry, so that these interesting remains have passed muster before the highest special authorities of France—a proof of their historical importance. They are certainly not repetitions of the famous Red Grots, excavated by M. Rivière twenty years ago at Menton on the same coast.

A great variety of students will be glad to have Prof. L. F. Barker's handy volume: "Anatomical Terminology, with Special Reference to the [BNA]" (Philadelphia: P. Blakiston's Son & Co.). For the uninitiated it may be added that the title refers to the anatomical names discussed for some years and finally adopted by the German Anatomical Society at a meeting in Bâle in 1895, being the most successful effort ever made to establish a simple and consistent nomenclature in the place of one of great complexity. Such a list, already widely accepted, in spite of certain defects, has value in many fields of study. In this edition the Latin names of the "BNA" appear on one page while the opposite page carries what are said to be "literal English equivalents." This part of the work is not altogether well done. Certain good English equivalents are conspicuously absent; we miss unwillingly, for example: chest, teat, gullet, windpipe, gut, midriff, foreskin. The medulla *oblongata* is the extended or elongated medulla (spinalis) and not the "oblong medulla" of the text and some dictionaries. That "ala" is a "contraction of axilla," and "axilla" itself again a "prominence of shoulder," will amuse both Latinists and anatomists.

In support of his contention that visual defects, overlooked or improperly corrected, are the cause of much ill health and the explanation of many unhappy lives, Dr. G. M. Gould has issued two more volumes, the fourth and fifth, of his "Biographic Clinics" (Philadelphia: P. Blakiston's Son & Co.). With a few exceptions the chapters are reprints of articles already published in medical journals. The strictly biographical studies relate to Balzac, Tchaikovsky, Flaubert, Hearn, and Berlioz. The author's theory that opium was a factor in the life of Flaubert for many years is interesting, and his account of Hearn is based upon an intimate personal acquaintance. The rest of the material is also largely "biographic," inasmuch as many cases are given in great detail. It would do much to gain acceptance for the general doctrine of the writer were it but presented with more discretion and less acrimoniousness, and, we may add, much more briefly.

In "Birds Every Child Should Know" (Doubleday, Page & Co.), Neltje Blanchan, has taken the best-known facts about our common Eastern birds, and put them into simple language for children. The chief criticism is the number of these facts which is crowded into each short essay. Children, as a rule, enjoy their nature study in more homœopathic doses; but when diluted with judicious interpretation by a grown person, this book must prove of great use in leading children to an interest in birds. Occasionally, without reason, human standards of morals are read into the habits of birds, as where the author advises every child to know the "contemptible" cowbird, if only "to despise it." A child should be taught to find the key to such habits—in the struggle for life—and to comprehend the artfulness of the cowbird in depositing its egg in the nest of another bird, as well as the wit of the warbler, which leads it to build a second story to its nest to avoid hatching the changeling egg. Otherwise we should "despise" all hawks and owls for killing birds and mice, and the shreik for impaling his prey upon thorns. Moult is very vaguely, or rather not at all, explained, the loss of the characteristic markings of young birds being described as a fading away. "Mrs. Bob-white," in the photograph on page 237, is a male bird. But these minor slips are few, and the book, as a whole, is well up to the standard set by the numerous pictures, which is very high. They are photographs from life by many nature photographers, and are printed in pleasing sepia tones.

A new edition of Mabel Osgood Wright's excellent "Birdcraft" (The Macmillan Co.) is always welcome. Its especial value lies in the way in which the principal facts concerning a bird—length, color, song, season, distribution, nest, and eggs—are set off in distinct paragraphs, making reference easy and direct. The only change from the old editions is the absence of the badly-colored plates of minute figures of birds and the substitution of eighty uncolored plates by Fuertes, including some of this artist's best work. Many of these are from the 1903 edition of Coues's "Key."

Prof. Ernst von Bergmann, the celebrated German surgeon, died at Wiesbaden on Monday. He was born at Royen, Livonia, in 1836, and studied medicine at the Universities of Dorpat, Vienna, and Berlin. During the Austrian-Prussian war of 1866 he was at the head of the Military Hospital at Koeniginhoff, Bohemia; and during the Franco-Prussian war he directed the military hospitals at Mannheim and at Carlsruhe. He was appointed professor of surgery at Dorpat in 1871, and remained there until the outbreak of the Turko-Russian war, when he was attached to the Russian army of the Danube as consulting surgeon. In 1878 he became chief surgeon of the hospital at Wurtzburg; and was called in 1882 to succeed Prof. von Langenbeck in the chair of surgery at the University of Berlin and in the direction of the surgical clinic of that city. Von Bergmann's contribution to the scientific advancement of surgery can hardly be overestimated. His chief interests lay in the study of the antiseptic treatment of wounds, and in advanced research concerning the diseases of the brain. When he entered upon his professional career the complications of so-called "wound fevers," which arose from countless sources of infection, still terrorized the victims of gunshot wounds and the subjects of surgical operations. The knowledge of bacteriology was still in its infancy, and such antiseptic methods as had been inaugurated took the simple form of excluding air from the wound by means of antiseptic dressings. Von Bergmann took the further step of vetoing the use of steel probes, which had been a fertile source of infection. His experiments in the Turko-Russian campaign became the basis for the later developments in antiseptic surgery. He wrote much on his specialties. Among his works we may note: "Die Resultate der Gelenkresektionen im Krieg," 1872; "Die Behandlnng der Schusswunden des Kniegelenks im Krieg," 1878; in several of his later works he collaborated with other medical authorities. His seventieth birthday, as we noted in our issue of January 3, was made the occasion of a national expression of esteem. Forty delegations called upon him to express appreciation of his services. Dr. von Bergmann was not only great in his profession, but with the wide sympathies and culture which are found in the highest type of German scholarship he had devoted time to the appreciative study of art, music, and the drama. He was everywhere recognized as a leader among those who work for the public welfare.

The many young students, the many unknown foreigners, who profited for many years by the counsel of the late Henri Moissan and by free access to his laboratory after he was already a great man, and when time was valuable to him, will be glad to see the following lines which his latest pupils have thought it necessary to publish *in justam memoriam*:

Greatly occupied as he was by the exacting work of committees and learned societies of which he was a member, he still passed long hours daily in his laboratory, advising and stimulating each one of his pupils. On the spot he put aside every preoccupation foreign to his researches, and set to work himself with invariable good-nature, patience, and tenacity, giving those around him the example of his incomparable technical ability and sureness of appreciation. Those who were only acquainted with his *ex cathedra* teaching cannot realize how carefully he kept himself abreast of new physico-chemical theories. In his lessons, while striving to bring into relief important experimental facts, he never failed to point out with exact words the à priori concepts of present-day chemical theory. In his investigations he always kept in mind the newest methods, and his capacious memory let no physical discoverics pass unnoticed, when they could help to guide the experimenter in new ways. The most minute researches did not repel him; and his work in the desiccation of gases and on the influence of traces of water in numerous reactions show, among other things, that he pushed precision in his experiments as far as possible whenever it seemed useful to him.

This note was called forth by a criticism published in the *Revue Scientifique*.

Drama.

ERMETE NOVELLI.

If a dramatic imagination and executive capacity—the mimetic power of impersonation, complete control of facial and vocal expression, and mastery of all known theatrical expedients—were the whole of histrionic genius, Ermete Novelli, now playing in the Lyric Theatre, would take his

place with the greatest actors known to theatrical history. As it is, his versatility, his remarkable skill, and his wide range, put him in a class by himself so far as any visible rivals on the English-speaking stage are concerned. But in the ultimate analysis of acting, in any endeavor to establish a comparative standard of excellence between highly accomplished performers, the general conception of a p r often counts for more than the most dazzling brilliancies of execution. As in a poem, the beauty, pathos, or nobility of a sentiment gives special value to the words which express it, so in a stage impersonation the beauty, pathos, or nobility of a suggested ideal will atone for occasional imperfections of utterance. On the other hand, no richness or splendor of mere theatrical artifice can extort admiration or sympathy for a conception that is fundamentally mean, paltry, coarse, or common. A failure to discern the finer elements in a poet's creation marks a corresponding defect in the understanding or the fancy of the interpreter.

It was by his performance of the part of Corrado in Giacometti's "La Morte Civile" that Signor Novelli confirmed the suspicion, excited by his King Lear and his Shylock, that his material skill was superior to his artistic instinct, his spiritual intuition, or his imaginative grasp. The fact that his Lear, while abundantly pictorial and devoid neither of power nor pathos, conveyed no sense of majesty in his state or of sublimity in his ruin, and that his Shylock exhibited no higher qualities than avarice, cunning, and savage hate, might be explained, in part at least, by natural misconceptions engendered by a perverted text; but no such excuse is available for his vulgarization of a stock character of the Italian stage. Nor can the shortcomings of his Corrado be ascribed to any executive disability on his part. Technically, it was a most striking performance, boldly and minutely wrought, fiery in passion, terrible in suffering, and occasionally pathetic in its fierce yearning; but it portrayed a personality which must have been coarse and common from the first, without any hint of former refinement or consciousness of an abysmal fall. In ornate theatrical device and startling contrasts, it was a far more elaborate and spectacular embodiment than Salvini's, but in essential humanity, delicacy of imaginative sentiment, and tearful appeal, it was vastly inferior. On the surface, Novelli's performance was sensationally realistic, but Salvini's showed the deeper and clearer insight, because it always suggested the nobler impulses which made the final renunciation logical and irresistible, not manifestly theatrical.

In Louis XI., an eccentric, material, and almost purely theatrical character, a study in craft, cruelty, paroxysmal cowardice and passion, Novelli was superb. A more vital realization of Delavigne's stage monster could scarcely be imagined. The intellectual alertness, the moral depravity, and the physical decay were denoted with a diabolical veracity. It was a great histrionic achievement, but it is to be noted that in all the complexities of the part there is no demand anywhere for a single note of the higher human emotions; no gleam of love, sympathy, tenderness, pride, or honor. Only the baser, elemental, commonest instincts of humanity are involved. That Signor Novelli excels chiefly in the interpretation of these commoner human traits and often fails to comprehend or, at any rate to dwell upon the nobler elements in the assumed character, was again indicated in his Othello, in which the animal side, with its amorousness, suspicion, jealousy, and furious passion, was depicted with startling vividness, vanity, and physical power, while of the noble Moor, whom Lodovico knew and who fascinated Desdemona, there was scarcely a trace. There are precedents and authority for a certain rough ferocity in some of the crises of the Moor's torment, but there are many opportunities in the earlier scenes to show the finer qualities of the man; and of these signs Novelli failed to avail himself. Thus it came to pass that his impersonation, while full of brilliant histrionic achievement, was, on the whole, unattractive and unsympathetic. Salvini's was infinitely superior to it in almost every respect, in dignity, distinction, true tragic inspiration, and emotional eloquence—Novelli's astonishing versatility received another illustration in his performance of Geronte, in Goldoni's "Il Burbero Benefico," but the portrayal of extravagant choleric humor makes no great demand upon the higher intellectual or imaginative faculties. Many players of secondary rank have had this gift.

Students of pre-Shakespearean drama will be glad to get in D. C. Heath & Co.'s Belles-Lettres Series "Supposes," translated from the Italian by George Gascoigne, and "Jocasta," translated by Gascoigne and Francis Kinwelmersh. The editor, Dr. John W. Cunliffe, associate professor of English at McGill, has done his work well. He has given us short biographies of Gascoigne and Kinwelmersh, concerning whom but little is known. He sketches briefly the development of the Italian drama of the Renaissance, with particular attention to Ariosto's "Suppositi", and Ludovico Dolce's "Giocasta," the two plays that Gascoigne translated. The notes to "Supposes" cite the references to it in contemporary Italian as well as English literature, and give the Italian original of many of the more interesting passages. "Jocasta" is printed with the Italian "Giocasta" in full on the opposite page. The volume, so cheap and so well printed, is a useful addition to our literature on the history of the drama.

We have so often pointed to the admirable qualities of the First Folio Edition of Shakespeare published by T. Y. Crowell & Co. that we may be excused from doing more than name the latest issue, "Much Ado About Nothing."

Chatto & Windus are preparing a series of volumes to contain reprints of the sources drawn on by Shakespeare for his plays. Professor Gollancz is general editor of the series, which is to be issued in the style of the King's Classics.

Mme. Nazimova has in rehearsal a new comedy, from the Italian by Roberto Bracco, which will be produced at the Princess Theatre for the first time on Monday, April 8.

Music.

Gregorian Chant for the Teacher, the Choir, and the School. By Edmund G. Hurley. New York: G. Schirmer.

When Mendelssohn heard the ancient Gregorian music to the Passion in the Holy Week services sung in Italy he wrote home:

> It does irritate me to hear such sacred and touching words sung to such insignificant music. They say it is *canto fermo*, Gregorian, etc. No matter. If at that period there was neither the feeling nor the capacity to write in a different style, at all events we have now the power to do so.

Nor was Mendelssohn the only musician who disliked the Gregorian Chant. Rossini once wrote to Liszt that if he lived, as Liszt did, with the Pope, he would fall at his knees and beg him to revoke his edict regarding the restoration of the old Gregorian service and the exclusion of women from the choir.

It will thus be seen that Pius X. was not the first Pope who made special efforts to restore the use of Gregorian chant by the people. His *Motu Proprio* of November 22, 1903, nevertheless created a commotion, especially the sentence reading: "Whenever, then, it is desired to employ the high voices of sopranos and contraltos, these parts must be taken by boys, according to the most ancient usage of the Church." The unwillingness to dismiss women singers had a good deal to do with the fact that, although the edict concerning the restoration of the Gregorian Chant closed with the words, "and we do by our present handwriting impose its scrupulous observance on all," it was very widely disregarded, in Rome as well as elsewhere. It was found that the exclusion of the more modern (not infrequently operatic) music from the service seriously diminished the size of the congregations. Two years after the edict had been issued, Archbishop Diomede Falconio referred to the fact that there were pastors who had not yet made a single move toward the desired reform. Inquiring into the cause of this "aberration," he was told that "it is difficult to follow out our Holy Father's instructions." It was in the hope of removing some of the difficulties which beset the pastor or choirmaster, who is anxious but unable to carry out the instructions of the Pope, that Mr. Hurley, who is organist and choirmaster of the Church of St. Paul the Apostle in New York, prepared his little book on Gregorian Chant. In doing so he has been at pains to have the explanations and instructions written in such a manner as to bring them within the comprehension of those who are to sing the chant. He warns leaders against getting editions of the chant books in modern notation, because a Gregorian chant can be sung intelligently from its own notation solely. This old notation looks puzzling at first, but it doubtless has its advantages for the purpose in view. Incidentally, Mr. Hurley drops a number of general hints about training choirs which make it worth while even for those to read his book who are not convinced of the advisability of restoring the Gregorian Chant.

A book entitled "How to Write Music

Without Melody" would be very timely, but it would also be quite superfluous, for so much music of that kind is at present being perpetrated in Germany, Russia, France, and Italy that one gets the impression that it must be very easy indeed to make it. The English composer Sir Alexander Mackenzie remarked in a recent lecture that modern French composers had lately advanced to the writing of music in which no chords hitherto known occurred; only combinations of notes that had little or no relationship. His reference is chiefly to Debussy, the leader of the French secessionists. The audience at the last evening concert of the Boston Orchestra in Carnegie Hall had an opportunity to hear the latest product of Debussy's industry: three orchestral sketches grouped together under the head of "The Sea" and entitled "From Dawn till Noon on the Ocean," "Frolics of Waves," "Dialogue of the Wind and the Sea." The chief characteristic of these pièces is the absence of melody; even the admirers of this sort of thing admit that, but they assert that Debussy did not aim at melody! He scorns such an old-fashioned thing as that. Very well; let him write a single melody like the best to be found in the scores of Bizet, Gounod, Saint-Saëns, or even Berlioz; if he succeeds, the rest of us will be more ready to believe that his lack of interest in melody is not of the "sour grapes" variety. But they will never persuade us that music without definite, original melody can be anything more than an ephemeral curiosity. Debussy in France and Strauss in Germany are the leaders of a large school of writers who are wasting much of cleverness in trying to prove that melody is not a necessary element of music. An admirer of Debussy has compared him to the proverbial French cook who can make a palatable and piquant dish out of thistle tops. Perhaps he is such a chef; but most of us will continue to prefer dishes made of more substantial material.

While Sir Edward Elgar may not be as great a composer as his admirers fancy, he is certainly original in one respect: he has applied to the oratorio the "to be continued" plan of the magazine serials. A few years ago he produced a choral work entitled "The Apostles" before he had written the conclusion. This last part was subsequently brought out as a separate oratorio under the title of "The Kingdom"; and the composer has intimated that still another chapter is to follow. After hearing "The Kingdom" under the composer's own direction at Carnegie Hall, one can easily understand that this process might be indefinitely continued. Dr. Elgar's official commentator has made the discovery that there are seventy-eight leading motives in the score, as against ninety-two occurring in "The Apostles." Many of the themes in "The Apostles" are reintroduced in "The Kingdom," after the fashion of Wagner in his Nibelung operas. Unfortunately, Elgar utterly lacks Wagner's gift of creating motives which not only characterize that for which they stand, but are also interesting as music; wherefore, in his case, the Wagnerian system, instead of being an aid, is a source of weakness. One soon tires of his insignificant themes and themelets, and the general impression given by the oratorio is one of monotony, notwithstanding some excellent choral writing and clever use of orchestral resources. There was a large audience but not much enthusiasm.

With the performance on Friday the opera season at the Metropolitan Opera House will come to an end. The cast will include Fremstad, Schumann-Heink, Mattfeld, Burgstaller, Van Rooy, Blass, Goritz, Mühlmann, and Reiss.

The last concert this season of the New York Symphony Society under the direction of Walter Damrosch will he given on Easter Sunday night at Carnegie Hall. Composers represented on the programme will be Wagner, Tchaikowsky, Verdi, Elgar, Massenet, Strauss, Schubert, and Haydn. Mme. Gadski will sing an aria from "Aïda," and "The Earl King," with orchestral accompaniment.

Among the artists to be heard here next season are Paderewski, Kreisler, Josef Hofmann, De Pachmann, Richard Buhlig, Ernest Schelling, Fannie Bloomfield Zeisler, Olga Samaroff, Augusta Cottlow, Rudolph Ganz, Harold Bauer, Jan Sickesz, and Katharine Goodson.

A circular has just been sent by the New York Public Library to music clubs, societies, teachers, and others interested in the scores and literature of music, calling attention to the material of this kind in the library. Of music scores, there are in the various branches about 4,000 volumes. Of the more popular titles, the library has a large number of duplicates. About 300 volumes of music for the blind are included. Besides the scores, the library has about 2,500 volumes relating to the history, philosophy, and æsthetics of music, and many works on musical technique and on the origin and development of all the more important musical instruments. A central catalogue of all this scattered material may be consulted at the catalogue department, No. 209 West Twenty-third Street.

Art.

IMPRESSIONS OF THE SPRING ACADEMY.

It is a strange and significant combination on the walls of the Spring Academy this year. The two societies which were in former years opposing forces—the Society of American Artists and the National Academy of Design—are now exhibiting as one body in the most important official art display of the season. The Academy, whatever its past, cannot now be accused of narrowness. The writer can recall no time when so great a catholicity of taste has been displayed. On this score alone the present show is worthy of study. Under the same roof are paintings by men who are inspired by the latest outlook on nature, and by others whose adherence to old formulas has known no change. For years the Academy stood for traditional methods in "seeing" and painting; and to one who remembers the annual exhibits in the Venetian Palace on Twenty-third Street the contrast is so marked as to excite wonder.

Of late painting has tended to leave the field of anecdote and to express those feelings concerning the outside world which may more properly be conveyed by means of pigment. A mood of day, the play of light and shadow on the landscape, or in the city's thoroughfares, the turbulence and volume of the sea, as well as its color, the vague mystery and promise of spring, the fruition of full-leaved summer, the chill and sadness of autumn, and the dazzle of snow-clad earth in winter—these, with the color, modelling, gesture, line, and character that mark the form of man under varying illumination, are some of the legitimate themes that engage the mind and hand of the painter of to-day. It is just here that artists of the old school were less sensitive, less strictly artistic, perhaps; they often mistook the right uses of their medium and sought to move the beholder by tale or incident; or, if dealing with landscape, they painted the portrait of a locality rather than an inspiring sweep of country made significant by the structure of the land and the hour of the day. It is now the sentiment of the scene, the emotion it calls up, not the strict delineation of its topographical features, that occupies the painter. In giving this sentiment he seeks to develop beautiful phases of color, delicate surprises of corresponding "values," and to invest the whole with a fine breadth and directness that testify to his generous and keen observation, his discrimination and distinction of mind. For, after all, it is character that tells in the long run; and selection, judgment, elevated point of view, are qualities by virtue of which a work enters the realm of art.

If one could visit the present exhibition, then, with a complete sense of detachment, forgetting small dissensions, with a mind familiar with the practices of the recent past and also with the drift of experimental impressionism as it has influenced French art for the last twenty years and more, one would be struck with a feeling of satisfaction and be amused perhaps by a consciousness of incongruity. Here, side by side with stolid, unillumined, stereotyped canvases, canvases that have been put forth year after year with consistent sameness, we are confronted by examples of a completely different point of view. It is the landscapes perhaps that are the most original. A new world seems to have been revealed to these painters—they have thrown open the door to outside nature for all who have eyes to see. It is an inrush of new sensations that thrills one through the medium of paint. Air, light, vibrant atmosphere, gloom of woods, mystery of twilight with its confused shapes and tonal beauty, moonlight in umbrageous village lanes, with white clapboard dwellings in subdued relation of values testifying to sensitive observation—these are among the results offered for the delectation of those who love nature and find here its interpreters. All this is a far cry from the obvious and often commonplace statements that a former race of landscapists presented to a public whose interest was in a locality rather than in cosmic beauty. This is one aspect of the current exhibition in which it greatly differs from many in the past. It is the world and its loveliness,

its hours and its moods that have appealed to the landscape painters of the newer school; and one might cite a goodly number who are thus emotionally rendering nature in her essential charm.

Among the canvases in which this fresh vision, this emotional portrayal of nature, is happily marked is No. 231, The Golden Wood, by J. Francis Murphy, showing through yellowing trees an autumnal effect that moves the beholder with a sense of the transient and mellow glory of the season, the very breath of late October woods. An exquisite example of modern "seeing" is 284, The Old Church at Lyme, by Childe Hassam, a simple composition, spacious, calm-compelling, marked by taste in its well-disposed masses. Rising from substantial base to slender steeple, the church cuts the canvas, suggests the completing proportions, and gives the air of fragile altitude while conforming to an unstudied pattern of much distinction. This much for the design. The color is of a quality that might be found in some rare Persian tile, or better, in the opalescent air of a late summer day with a hint of autumn stirring among the branches of immemorial elms. This, with the pallid sunshine on the columns of the porch, the upper portion of the church silhouetted against a sky of radiant and subtle blue, makes a picture that touches, perhaps, the high-water mark of sensitive vision and achievement in the exhibition. It is in essence a phase of consecrated New England, and becomes art through a sustained and intelligent presentation of "the splendor of the true." River Rats, No. 18, by George W. Bellows, is so sordid a theme that it proves afresh that the artist and not the subject makes the work. Given a muddy, rocky embankment rising in the mutilated ugliness of transitional city improvements to the height of a third of the canvas, and above this unsightly bulk, unlovely buildings of factory-like character blocking all but a patch of perfectly toned sky, and you have the general structure out of which the painter has created a work of art. But he has done this by placing close to the heavy waters of the river a congregation of slender street arabs, nude, and panting for the cool but uncleanly stream. This aggregation of fragile and active forms, relieved by the massive and rugged formation of disrupted earth behind, acts on the imagination much as would some delicate conception of Cellini, in which his dainty figures appear more chaste because of their rough setting. Canaan Mountain, No. 61, by Emil Carlsen, is a dignified portrayal of a large and simple theme—sky, hill, and plain; but the treatment excites an emotion that it is the province of all true art to evoke. The balance of the above-named elements in the composition is satisfying, the qualities of painting, the actual pigment, are most agreeable, and the color fine.

The landscapes furnish the newest note in this interesting exhibition, probably because the habit of in-door labor and studio light incident to portraiture and figure work have tended to make results in this latter field less marked. The Interlude, No. 279, by Sergeant Kendall, is a figure composition, which, in its elements of color, line, disposition of masses and spacing, is very well constructed. Thus in spite of a certain want of spontaneousness in brushwork, it is too valuable in sentiment, as well as in design, not to be noted as one of the encouraging contributions to the collection. Among the other painters of figures and portraits there is competency with little that is new.

And it is the newer and fresher tendencies that one would dwell on—evidences of the progressive spirit which has seized some of our painters and which promises to carry them into the field of more legitimate exercise of their craft. This has influenced the figure men as well as those who paint landscapes, but not so strongly perhaps in manner as in matter. There are fewer "banal" subjects and more topics chosen for the opportunity they offer for artistic construction. What is most noticeable is a larger welcome to independent vision, a readier acceptance of the individual point of view.

FRANK FOWLER.

The following prizes have been awarded at the eighty-second annual exhibition of the National Academy of Design: Inness gold medal, Emil Carlsen, N.A., for Canaan Mountain; Thomas B. Clarke prize, Henry Prellwitz, A.N.A., for Venus; first Hallgarten prize, William Cotton, for The Princess; second Hallgarten prize, Hugo Ballin, A.N.A., for The Three Ages; third Hallgarten prize, Eleanor C. Winslow, for The Necklace; Julia A. Shaw memorial prize, Edith Woodman Burroughs, for a bronze statuette, Circe.

An exhibition of work in oil and watercolor by Charles Austin Needham will be open at the Salmagundi Club till April 6; and of paintings and etchings by Cadwalader Washburn at the New York School of Art till the same date. Among the dealers' shows in this city are paintings by Frank Russell Wadsworth at William Clausen's, till March 30; and masterpieces of line engraving, mainly of the nineteenth century, at W. K. O'Brien & Co.'s.

Rheims has received by bequest from the late Henri Vasnier a collection of pictures, mostly by artists of the "School of 1830." There are good examples of Corot, Daubigny, Jules Dupré, Millet, Théodore Rousseau, and Troyon.

Prof. dall' Osso's theory of a small Herculaneum has been recently noted in this column. In the *Tribuna*, Rome, for March 11, he now shows the practical bearings of the theory upon the proposed excavations. First, the task is less formidable than has been supposed. Recent observations have shown that the lava, which was supposed to cover the city, stops just short of the alleged intramural precinct. Above there are no more than seventy hovels, the expropriation of which should not involve prohibitive expense. If these views are accepted in Italy, they may accentuate a widespread dislike of the Waldstein project. If the work does not require enormous sums, nobody could blame the archæologists of the Peninsula for appealing to the historic *Italia farà da se*. Prof. dall' Osso sums up the arguments for the superior culture of Herculaneum as compared with Pompeii under the following items: the better masonry and pavements of Herculaneum, the rareness of taverns and places of low resort; finally, the fact that after the great eruption the refugees of Herculaneum settled in such old Greek cities as Naples and Cumæ, whereas those of Pompeii betook themselves largely to the provincial town of Nocera. He suggests accordingly that the excavations of Pompeii, which have already yielded about all that can be expected, be suspended, and the efforts of the nation concentrated upon Herculaneum. Such a change, we have no doubt, would be welcomed by the learned world everywhere.

The *Rassegna d'Arte* makes a specialty of the inedited, and the March number is strong in this class of article. Bernhard Berenson adds a third to the few pictures known by that rare master, who was apparently chiefly a miniaturist, Gerolamo da Cremona. The new piece is a predella panel, representing the possibly unique subject, Poppea Giving Alms to St. Peter. It belongs to Lady Henry Somerset, Reigate, England. F. Mason Perkins notes four new panels of the much exploited Sienese painter Sassetta. Two of these are in the small but interesting collection of Dan Fellowes Platt, Englewood, N. J. They are reproduced, and evidently belong to Sassetta's best. Among other articles of exploratory type, Guido Cagnola describes and illustrates Giottesque frescoes in the Lombard churches of Vibaldone and Solaro. It is a valuable addition to the accumulating evidence for a thriving Lombard school during the Trecento.

Italy's ambition to excavate on a larger scale than heretofore has been fully roused. Not only has it refused all foreign aid for excavating Herculaneum, but it is planning other undertakings of great importance. Ostia, the ancient port of Rome and one of the favorite summer resorts of fashionable Romans during the Empire, is at last to be excavated, and the work to be started within the year. An attempt will also be made to find the remains of the great buildings at Pæstum, to which both Greek and Roman historians frequently refer. At present the city walls and three magnificent Doric temples are all that can be seen of this ancient town. Moreover, the Baths of Diocletian, in Rome, are to be completely cleared. Signor Rava, the minister of public instruction, has obtained permission to expropriate all the houses in that neighborhood, and $100,000 has been conceded to carry out the plan. Finally, the money for the construction of the much talked of "Archæological Promenade" has been voted. This promenade, which is to be finished within three years, will start from the Roman Forum, will pass by the Colosseum and extend as far as the Baths of Caracalla on one side and the Baths of Titus and Trajan on the other. Preparations for a new Forum Museum, under the direction of Commendatore Boni, have already been made. To carry out these extensive plans the appropriation for excavations has been doubled and the yearly sum expended for antiquities and fine arts has been raised from $1,023,815 to $1,152,725.

M. de Mathusieulx has given the Paris *Figaro* a foretaste of what he has to say about his recent explorations in the ancient Cyrenaica—an unexplored field of immense possibilities in Greek archæology. He received less encouragement from the Turkish Government than during his three previous sojourns in Tripoli; and it seems likely that the ruins of the Pentapolis will re-

main hidden for some time to come beneath the Libyan sands. But it is something to have stood on the Acropolis of Cyrene, the city of temples and palaces, where Herodotus found a famous school of medicine, and, looking from the height along the African shore of the Mediterranean, to have identified the four ancient ports enriched by the trade in gold and ivory and ostrich plumes from the Sudan—Apollonia, where Plautus laid the scene of his "Rudens," a rock-cone with a marble-pillared shrine of Venus, and forty steps descending to the amphitheatre of its quays; Ptolemais, with porphyry edifices behind the three-mile circuit of its ramparts, and a giant aqueduct leading from mountain springs; Arsinoe, looking seaward from its hilltop; and Berenice, with its famed Garden of the Hesperides, mirrored in placid Lake Triton. From the ruins of Barka, Cyrene's rival, Louis XIV. quarried the colored marbles which still adorn his palace of the Trianon at Versailles.

By the injection of his own personality, J. C. Alfred Prost has made something distinctly entertaining of his pamphlet, printed in a limited edition, on the not enthralling subject of "Deux Œuvres de Greuze." From the amusingly self-satisfied expression of the "portrait of the author" at the beginning to the note on "Les Stroganov, Stroganow, Strogonoff, ou Strogonow" at the end, this aggressive personality is everywhere in evidence—a personality marked by arrogant self-confidence, fanatic royalism, hatred of foreigners, and the attribution of vaguely sinister motives to all opponents. M. Prost's main object is to prove that a portrait in his own possession is that of Madame Royale, painted by Greuze, and that a portrait of a child, by that artist, in the Museum of Besançon, is that of the ill-starred Dauphin; but such a controversy can rarely have been carried on in the tone of this one. Those who have had any doubts as to the reality of M. Prost's find are *les fats, les sots, les habiles, les envieux, et les prétentieux;* while Auguste Castan, author of the Catalogue of the Besançon Museum, who had catalogued the portrait of a child as that of Paul Strogonov, is accused of voluntary error and *arrière-pensée.* Another of M. Prost's treasures is a miniature which he believes to be the last portrait of the Dauphin, and apropos of this he makes a violent attack on Otto Friedrichs, an advocate of the claims of Naundorff, *un homme dont j'ignore jusqu'à la nationalité,* and who is therefore gravely suspect. Perhaps as characteristic as anything in the pamphlet is the fact that while the author gives us his own portrait, he does *not* give any reproduction of the two pictures in his own possession, from a *scrupule d'amateur,* and "not to deflower his collection." We must judge them entirely on his report.

We have received from Karl W. Hiersemann, Leipzig, Catalogue 330, "Manuscripts of the Middle Ages and of Later Times, Miniatures on Leaves Facsimiles." More than two hundred codexes are elaborately described in German and French, besides numerous single sheets and similar papers. The quarto size of the page presents the many facsimiles to advantage. In short, this must be reckoned among the trade catalogues that are also books of reference. We can mention only a tiny miniatured Vulgate of the thirteenth century, and an Old Testament of a little later date, both remarkable examples of French illumination of the best period; an Hours of the Paris school of the fourteenth century, with extraordinary foliated ornaments; a fine series of Persian and other Oriental manuscripts; a Greek lectionary with outline drawings; and, finally, the original manuscript of Beethoven's Sonata op. 96 for violin and piano.

It is not necessary to say more of Lionel Cust's "Van Dyck" in the Bell-Macmillan Great Masters' Series, than that it is an abridgment of his larger work (brought out by the same publishers in 1900, and reviewed by us at the time), with the addition of some new facts, bringing it "up to the level of present-day knowledge." These should give it a certain value, even to those who possess the essay in its original form, while to those who could not afford that splendid volume the present more modest publication will be doubly welcome.

Frederic George Stephens, one of the seven original members of the Pre-Raphaelite Brotherhood founded in 1848, has just died, in his eightieth year. Mr. Stephens abandoned work as a painter at a comparatively early age, and became an art critic. Readers of Holman Hunt's autobiography, published in 1905, will remember that Mr. Hunt, as alone faithful to the early principles of the coterie, passed rather severe strictures on Mr. Stephens for his friendship in later days with the Royal Academy.

The death is announced from Cambridge, England, of J. F. Herring, aged ninety-two, at one time a well-known painter of animals and farmyard scenes. He was one of a numerous family, who all painted in the same vein. The best was his father, the original J. F. Herring, who began life by driving coach horses and ended by painting them. He was also the inventor of a peculiar type of farmyard *genre,* which had great vogue in the thirties and forties, and which was continued by his sons. The J. F. Herring who has just died, produced many clever little pictures, with horses or poultry or both as their chief feature. Many of these are well known from engravings and photographs.

At an auction at Christie's, London, on March 9, a drawing by C. Fielding, Landscape with Figures and Cattle, brought £210; by Meissonier, Le Fumeur, £493; and by Rosa Bonheur, Denizens of the Highlands, £441.

Finance.

INTERNATIONAL UNSETTLEMENT.

In the middle of last week, a report was circulated on the European money markets that the Bank of France, which occupies the same relation to the Paris money market that the Bank of England holds to financial London, would advance its official discount rate. The rumor was not credited. The French bank rate had remained unchanged since May, 1900. It had not been advanced during the struggles of the Bank of England last autumn, when the 6 per cent. rate ruled in London, and when Paris was practically driven to give up gold in behalf of London. Only on four occasions in the twenty-five past years has the Bank of France raised its rate; and for such protective action there was a visible reason on each of these occasions—the Boer war outbreak of 1899; the European famine, accompanied by abnormal gold shipment to pay for our wheat, in 1898; the collapse of the "copper syndicate" and the Panama Canal Company in 1888; and the Paris bank crash of 1882. No such conditions, it was confidently argued, confronted the bank now.

Nevertheless, last Thursday afternoon the French Bank advanced its rate, and on the foreign markets, after a brief pause of perplexity, an outbreak of general commotion and disturbance followed. Towards the end of the week, something like panic occurred on the Berlin and London Stock Exchanges; at London, all securities fell into demoralization, British consols in particular dropping ½ point in a day. At the close of the week, alarming rumors were circulated in financial London, and apparently believed in usually well-informed quarters. These reports were the more credible, because the so-called "fortnightly settlement" on the London Stock Exchange was to begin on the following Monday. Trades on the New York Stock Exchange are settled daily; within twenty-four hours after the bargain has been struck the seller must deliver his stock and the buyer hand over his check. In London, on the contrary, such settlements are made on fixed dates, separated usually by a fortnight. On that Exchange the buyer of securities may have closed his bargain only a day after one "fortnightly settlement," but he need not pay until the next ensuing "settlement day." Such a system frequently results, of course, in concealing, for some days, the straits into which a London operator may have been brought. In November, 1890, for instance, the "settlement" did not occur until a full week after Baring Brothers' failure; in the meantime nobody could know surely how badly the Stock Exchange was hurt. So of our own "May panic" of 1901, which recoiled on London. Wall Street had nearly forgotten the severity of the crisis, when, a week afterward, the most serious distress appeared at the Stock Exchange settlement in London.

That the "London settlement" this week would show the real effect on London of the Wall Street collapse of nearly two weeks before was a natural inference, and such expectation did its part in increasing last week's uneasiness. Yet the fears of last Saturday have not been realized in the event. The London settlement has passed off smoothly; no Stock Exchange failure of any consequence has occurred, and even Berlin, concerning which market equally grave misgivings were expressed, has failed to show the expected demoralization. What is to be said of so singular a case of misjudgment by a financial community?

It may be most clearly described as an instance of international unsettlement. London is always a more or less extensive speculative holder of American securities; and a fall of 20 points in New York prices

would impair to that extent the credit of a London investor in our stocks. But this is not all. Traditionally, a panicky stock market at New York leads to urgent demand for foreign gold to support our bank reserves; and in the present case New York exchange on London was already at the gold import point. In the face of such conditions and the not unreasonable apprehensions as to their outcome, the Bank of France had taken the step which was itself a warning.

There were several conclusions which other markets might have drawn from the rise in the French Bank's rate. Paris, alone of all great European markets, holds a supply of gold on which, in a possible emergency, other markets had thought they might rely. New York was known to have been negotiating for gold imports from that quarter. It was admitted, by all European financiers, that Paris was practically "financing" Berlin in the German market's time of stress. And if Paris withdrew such facilities, the chances would ordinarily he that demands would converge on London. But London was prepared to resist them; hence, very naturally, the misgiving and unsettlement as the test of the markets drew near.

The event thus far has happily proved that last week's apprehensions were needlessly acute. Of all the alarming possihilities then set forth, the higher French Bank rate is the only realized fact. Precisely what was the purpose of that institution in making the change of last Thursday, and just what the view of its managers is, in regard to the financial future, is not much clearer than it was a week ago. Two distinct inferences which may be drawn from last week's episode as a whole are that the world's great financial markets are at present more than usually hound together in the vicissitudes of the perplexing money situation; but that, on the other hand, all of them recognize the situation and are on their guard.

Just Published

Merrill's Lucretius, De Rerum Natura

$2.25

This volume, the only complete American edition of the poem, contains an introduction, the text of the entire poem, a commentary, and an index. The introduction gives a sketch of the life and character of the author, the principles of the Epicurean philosophy, an appreciation of the poem and of its subject-matter, and a brief criticism of previous editions. The text is an independent recension in the light of recent critical work. The commentary is elaborate, yet concise, and contains brief criticisms of proposed emendations of the text, with numerous parallel passages from Lucretius and other authors.

BROWN BROTHERS & CO.

NO. 59 WALL STREET, NEW YORK.

The Nation.

NEW YORK, THURSDAY, APRIL 4, 1907.

The Week.

Beginning with this issue, the editorial and publication offices of the *Nation* will be in the new Evening Post Building, Nos. 20-24 Vesey Street. The Post Office box remains unchanged—No. 724.

President Roosevelt's refusal to "make a speech" on the lines suggested, with so delightful a vagueness, by certain railway officials, should put an end to a chapter of absurdities. The gentlemen referred to have been reiterating two assertions—that the "campaign against the railroads" was solely responsible for the Wall Street disturbances, and that all such troubles would be ended if the President would only "make a speech." What was to be contained in this mysterious "speech," no railway oracle has told us; we suspect that none of them has been able to make an intelligible suggestion to the President. The reason is that they knew all the time, first, that "railway regulation" did not cause the crash in stocks, except in so far as the clamor of the railway men frightened their own shareholders; and, second, that Mr. Roosevelt could neither do nor say anything which would alter the situation as to the railway legislation. The Railway Rate bill has been enacted into law; what the States propose is a question which the States will themselves decide. As for the grave contention that a law proposing to keep the "water" out of railway incorporations would destroy vast amounts of invested capital, even school-children know that legislation cannot be retroactive.

It may be modesty for Secretary Taft's brother, in acting as the spokesman of his Presidential boom, to eliminate personalities and declare this "a direct contest between the friends of the Administration of President Roosevelt and his opponents." It is certainly not good political sense. If Taft were a man of small and unimpressive personality, lacking in moral fibre, incompetent in statecraft, there might be some point in thus reducing him to a sort of proxy, a mere abstraction representing somebody else's record. But he is none of these things. He would have been an available candidate even if there had never been such a man as Roosevelt. These tactics are as unfair to the Secretary himself as they are to the Republican voters of Ohio, who, after producing from their own ranks three former Presidents, certainly should be supposed capable of recognizing the right man now. But it has become a habit to test everything political with the Roosevelt litmus paper. Thus we can hardly blame Charles P. Taft for his method of simplifying a complicated issue. Too many Roosevelt successes have been won already on the platform that "them who is not wid him is agin' him."

Water competition being regarded more and more as the one permanent safeguard against railroad extortion. President James J. Hill of the Great Northern makes the further suggestion that improvement of waterways may relieve the present freight congestion. "There has been in the past," he said, "a feeling among some railroad men that waterway development would be inimical to railway interests. I do not think it would, and if this idea has not already wholly disappeared, it is in a fair way of doing so soon." In the popular mind, certainly, the idea that the railroads alone are sufficient to the transportation needs of the country is no longer held. This feeling we have seen expressed in the revival of river traffic last year in several streams where it had been suspended for a long time, and indications multiply that there are to be other instances of the same kind this coming season. Mr. Hill's interview will probably lend impetus to the organized demand for more money for river and harbor improvement. This year's appropriation bill was in excess of the $50,000,000 which the Waterways Congress asks to have allowed annually. Even an appropriation of that amount every year would merely equal about one-quarter of our outlay on the army and navy.

The English are quicker than we in some things. Our Philippine insurrection ended long before their Boer war. Yet complete self-government, with the defeated Boers in the saddle, will have been in working order for at least five months before our Filipinos elect their first General Assembly. The President's order, signed on Thursday night, leaves the date indeterminate, but the Philippine Commission had already fixed July 30 for the balloting. The appearance at Washington of the commissioners to be chosen at the same time will be a novel and significant incident in the next Congress. Secretary Taft, in a statement before a House committee, when the project for creating a Philippine Assembly was first under consideration, remarked that tho new body would doubtless "begin by trying to pass acts for the complete regeneration of mankind." Practical legislation is an art that neither they nor any other people can learn, except by experience. John Barrett's often-quoted comparison of the independent Philippine legislative body with the Japanese Parliament, however, remains on record. And the Islands can, at least, produce orators. It was announced only last week that the State of Illinois will be represented in an interstate oratorical contest next month by a native Filipino.

Chicago, according to the latest figures from the Census Bureau, leads the country in increase of population since 1900. Against an increase of 10½ per cent. for the nation, Chicago proudly points to a rate almost double, 20 6-10 per cent., to be precise, and one full per cent. ahead of this city. For the same period we are told that the population of all incorporated places having 8,000 or more inhabitants has increased by nearly 16 per cent. In other words, the enormous growth in Chicago and New York has been paralleled in most urban centres. At the same time, it should be noticed that all our great cities, with the exception of the two mentioned, fall below the general urban rate of 16 per cent. Thus St. Louis has increased only 12.8 per cent., Philadelphia 10.3 per cent., Baltimore 8 per cent., and Boston 7.5 per cent. The inference would seem to be that the rush from the country to the cities is directed chiefly towards the small towns because of contiguity, and our two monster cities because they *are* monstrously large, and only in a minor degree to cities that can show but a puny half or three-quarter million people; or else that such half-way cities as Boston, Philadelphia, and St. Louis act as pumping stations and feeders for the capitals of the East and West respectively.

The defeat of the attempts to do away with the Pennsylvania State Constabulary is of more than local significance. One of the numerous repeal bills passed the House, but none will become law. Thus ends another effort of organized labor to weaken the police power of a State. The National Guard has been assailed directly and indirectly in various quarters; the prompt attack on the new State constabulary is clear testimony to its effectiveness. But aside from the labor-union aspect of the question, a muster out of the Pennsylvania force would have discouraged efforts now making elsewhere to establish similar organizations. Nowhere are they more needed than in the South, where long stretches of country are practically without any police protection, either against lynchers or the individual crim-

inal, and where the sheriffs, as elsewhere, are often cowardly or inefficient. Two years ago it was hard to get any one in the South to see that a State constabulary would be one of the best means of preventing race trouble. To-day many have come to a different point of view. In South Carolina, for example, a constabulary measure has been under discussion in the Legislature. The success of the Pennsylvania experiment has had much to do with this change of feeling.

Public opinion will, we think, cordially support the grand jury in its indictment of Ira A. McCormick, the general superintendent of the New York Central, and A. H. Smith, the general manager, for gross carelessness leading up to the Woodlawn wreck. It is inconceivable that this, the worst of the Central's long list of accidents, should go unpunished. Nobody suffered for the tunnel accident; no one went to jail for the Hastings wreck, not even the brakeman, whose culpability was beyond doubt. When the roadbed gave way and precipitated a train into the river at Garrisons, no one paid the penalty; the Central, having at last awakened to a realization of its dangerous condition, merely strengthened its road. So far as laymen can judge, the guilt of the responsible officials in the Woodlawn wreck has been clearly proved. Both engines were partly disabled, the engineer was untrained, the speed dangerously high, and the roadbed at the curve had been reported in bad condition. If under these circumstances no one is to be punished, the New York Central should not wonder that the mass of the voters does not believe that the Public Utilities bill can be made too stringent, in so far as it affects the railroads and their operation.

As the result of the establishment of the General Education Board and the Carnegie Foundation for the Advancement of Teaching, there has been more careful and intelligent scrutiny of educational conditions in our colleges than had ever before been attempted. At last we are in a fair way to know both the actual status of the so-called higher education, and to ascertain which of the multitude of "colleges" and "universities" are what they pretend to be. The name signifies nothing, for, as the Carnegie report says, "it is not uncommon to find flourishing high schools which bear one or the other of these titles." The administrative boards of the two funds plainly have it in their power to help determine fundamentally what shall constitute the college in America. It is within their province to insist, for their purposes, upon certain definite requirements for admission, a curriculum leading in certain definite directions, and an adequate organization and equipment. The higher education of this country is largely in the hands of the small colleges, and not the great universities. The latter, from the nature of the case, are destined to be few; while the former are many. It does not matter that these many colleges are small, so long as they do actual college work. The lack of the lavish, and often bewildering, opportunity for selection in the choice of subjects presented by the universities with their unwieldy classes, is partly offset by the more definite character and clearer-cut purpose of the narrower range of courses offered, while the smaller classes mean closer contact with the teacher and with one's fellows. The small college, to seize its chance and take its proper place in the system of education that is surely coming in the United States, must, nevertheless, be a college in fact. It is not necessary that the colleges shall be all alike, for historical development and specific environment will differentiate them; and it will often be best for them to maintain their characteristic individuality. Their courses of study may vary indefinitely; and whether they favor an elective system, a prescribed system in whole or in part, or a group system will make little difference, provided they have a teaching equipment sufficient to attain their ends. Their admission requirements, however, from Maine to Mexico, should be substantially the same—at any rate in those essentials which mark the beginning of the higher as distinguished from secondary education.

One of the reasons advanced by the Massachusetts Commission on Industrial Education in support of a system of trade schools for children between fourteen and sixteen years of age, is stated as follows:

> Boys are not wanted in most of the skilled industries until they are sixteen years of age. The total result is a greater number of boys and girls from fourteen to sixteen years of age, most of whom are at work in various kinds of juvenile occupations, in which they learn no trade, are subject to little, if any, beneficial general education, and often to much harmful education from shifting experience and environment.

The argument is sound, and none the less so because it states succinctly the double view of the function of public education which we are getting more and more ready to accept. The school has not only its positive use, to teach children, but also a negative function, to keep children out of harm. In this State we have tied together the operation of the compulsory-education law with our child-labor regulations, by making strict enforcement of the one a preventive against violation of the other. The summer school gives the children a comparatively cool spot to play in. The evening school keeps young children, in their most susceptible years, from the maleficent adult surroundings of the factory and the shop.

France is not living up to her traditions of cosmopolitan intuition and sympathy—for example, in regard to the tariff. The French Government is said to be angry with us because we have shown no desire to meet her at least part of the way in finding some means to mitigate the rigorous, though inspired, provisions of our law. Impatient the Gallic spirit has generally been recognized to be, but that the French Government should grow petulant because a reciprocity treaty which it proposed in 1897 has so far failed to receive attention in Congress, is a little too much. We are Anglo-Saxons; we refuse to be coerced or to be hurried off our feet by weak-kneed, mawkish, mollycoddle sentiments of international generosity. What would these irritable Frenchmen have? Is not the Dingley act in the hands of its friends? Germany—well, Germany, in its rough Teutonic fashion, got tired and kicked up a row and had somehow to be attended to. But *la belle France*, we thought, had better manners than that. Friendship is a beautiful thought, but charity begins at home, and virtue assailed will stand patter than ever.

Out of the confiscated papers of Mgr. Montagnini, the Papal representative who was expelled from Paris last December, France bids fair to develop a sensation as exciting, for the time being, as that which followed the publication of the Hohenlohe memoirs. We look, however, to a different result. The German Chancellor's memoirs brought out the truth. It is difficult to say what will be brought out by the publication of excerpts, paraphrases, and vague allusions from the seized Papal documents, in this or that newspaper, save increased bitterness of party feeling and the appearance of a whole crop of personal enmities such as arose from the Dreyfus case. To attain truth in France you must *chercher la femme;* to conceal truth you must *chercher le cahier* or *le dossier*. The *Figaro* will publish facsimiles of two letters written by a well-known ex-Minister to a celebrated leader of the Extreme Right showing that the Government was courting the Vatican. Thereupon the *Matin* will declare, on the word of an "anonymous authority," that it understands the writer of the letters to have been Monsieur Dupain, and the *Aurore* will retort that the letters as photographed were stolen and incomplete, and that if published in their "integrity," they would throw quite a different light upon the matter. Duels follow as a matter of course, and in the

Chamber, Clemenceau is accused of selling the country to England, and in turn accuses M. Delcassé of selling it to Germany and the Pope. The full horror of the battle comes later, after a general amnesty has been published, in the form of a flood of *Mémoires intimes* and *Pièces justificatives*.

It is hard, indeed, that a German Imperial chancellor and an Italian minister of foreign affairs cannot meet for a pleasant two-hours' chat without being suspected of discussing the Hague Conference or the Triple Alliance. The latter topic, according to general opinion, would seem to have been the principal subject of the recent conversation between Prince von Bülow and Signor Tittoni. We are told that the existence of the Triple Alliance is threatened by growing dissension between Italy and Austria, and indubitably the events of the last few years have tended both to sharpen the feeling of reciprocal distrust and to remove the necessity of Italy's clinging to a partner she detests, by bringing her into vastly improved relations of amity with France. The riotous attacks on Italian university students at Innsbruck of some years ago are not forgotten in Italy; in the near East her aspirations are in conflict with those of Austria-Hungary; and very recently there have been reports of actual alarm felt in Italian Government circles at Austria's military preparations on her southwestern frontier. Recently published revelations dealing with the origins of the Triple Alliance have shown us that England's acquiescence in its provisions, in so far as they affected the Mediterranean balance of power, was one of the reasons which made Italy accept the alliance. With England so decidedly on the side of France, the situation for Italy must also change.

With the opening of what promises to be a prolonged agrarian debate, the Russian Duma has entered on that "constructive" programme of "fruitful" legislation to which it has been so repeatedly urged by the Stolypin Ministry. The discussion, it must be confessed, begins under no favorable auspices. Here, as in the question of amnesty, the Ministry has anticipated the Duma's decision by announcing its absolute disapproval of the principle of expropriation on various forms of which the vast majority of the deputies are bent. In other words, no broad solution of the land question is to be attempted, and the peasants are to be satisfied only by means of the present machinery of purchase and resale through land banks, with resort to expropriation in exceptional cases. That the Government should boldly announce its opposition to radical change is in line with the general policy of "strong-handed reform," with greater stress on the adjective than the noun. Perhaps the Duma's conciliatory attitude hitherto has served only to strengthen the Ministry's belief in its power to hold the country in check; or perhaps both the Duma's peaceful attitude and the Ministry's aggressive confidence proceed from a knowledge that the revolutionary zeal is slackening for the time. The dispatches say that the great mass of speakers in the debate are to be peasants "whose remarks will contribute but little to a solution of the question." How old Tolstoy's wrath would kindle at these words; and justly. Poor lawyers and statesmen though they may turn out to be, these peasant debaters ought at least to tell us what is the truth about the agrarian situation.

How serious the situation is in Rumania is indicated by the fact that Conservatives and Liberals in the Chamber of Deputies have agreed to bury their differences in order to make common cause against increasing anarchy. The Conservative Ministry under Cantacuzene has been replaced by a Liberal Cabinet under the veteran Sturdza, who as Premier from 1901 to 1905 was successful in coping with the disastrous results of a great financial crisis which visited the country in 1899, and in reestablishing the finances on a sound basis by dint of rigid economy. The Conservatives, on the other hand, have inclined to a policy of heavy taxation and broad expenditure. The Rumanian Government enjoys a monopoly of tobacco, matches, salt, and playing cards, exacts a direct capitation tax of one dollar and a half per annum, and levies an income tax of 6 per cent. on houses and from 5½ to 12 per cent. on farm property. With a population of some six millions, the nation has a debt of about $275,000,000, or nearly $50 per head. This is just about twice the per capita debt of the United States. The annual expenditure of about $50,000,000 would show the same proportional expenditure as in the United States, for a country whose wealth and resources are so inferior to our own. In other words, the Rumanian peasant would appear to be as heavily taxed as the Russian peasant; and if we add to this grievance the evil of absentee landlordism, we can grasp at least one of the conditions that have led to the present uprising.

Reports of a renewal of Moslem fanaticism in Morocco, directed chiefly against France, raise the question whether that Power, like England, has, as is often asserted, a "Pan-Islamic" problem on its hands. The *Quinzaine Coloniale* presents a condensed report by a French official who devoted the greater part of last year to investigating the situation in the French West African possessions. His conclusion is decidedly in the negative. The religious life among the Mohammedanized negroes is very intense, and the various orders and sects into which they are usually divided play a great part in their daily life; "but to speak of these organizations as secret societies formed with a view towards political action directed against us, is quite false." There is no common action among the great orders, nor do the members of any one order even follow the same political aims. The only danger arises from ambitious adventurers who aspire to establish their fame as *marabouts* or religious leaders, and traverse the country from the Gulf of Guinea to Algeria, claiming the character of *sherif*, or descendant from the Prophet; *wali*, or saint; and *hajj*, one who has made the pilgrimage to Mecca. These often create trouble. The report continues:

> In general, we may form a just conception of Islam in western Africa by imaging it in a juxtaposition of parishes and dioceses, under the headship of a *marabout*, in the midst of which new parishes and sees are constantly arising.

To the three older sects—the Senussi, the Kadriya, and the Tijanya—the writer adds two new orders—the Ghudf in Mauretania and the Tuhidites in the great bend of the Niger.

In anticipation of the introduction of the new Irish Home Rule bill, Lord Rosebery has set about forming a Liberal "cave." He announces that he will be against any measure establishing an Irish Parliament. This means that he has seen a great light since 1886 and 1893, when he followed and supported Gladstone in advocating such a separate Parliament. There is, however, no likelihood that the proposals of the Government will now go so far as that. The Irish themselves do not expect it. Something like an Irish Council, with an extension of the system of county government inaugurated by the Conservatives, is about all that is expected at present. Even against this mere beginning of Home Rule, however, Mr. Balfour is rallying his party to offer a bitter opposition. In a speech to the Irish Unionists the other day this statesman, so mildly philosophical as a rule, indulged in violent language. He spoke of "the criminal legislative conspiracy" of the Liberals, in connection with the Home Rule bill. Just what he meant is not clear; but apparently he dreaded the passage of a moderate Home Rule bill by the Commons, then its throwing out by the Lords, and thereafter a heightened agitation for the reform or abolition of the upper house, in which the Tories are so securely entrenched. But if the country really loves the Lords and the Tories, the Liberals would simply be rushing on their own ruin, and there would be no occasion for Mr. Balfour to get so excited.

NEW AUTHORS OF PROSPERITY.

Embittered railway men and their newspaper backers are now following a course singularly like that of arrogant high-tariff beneficiaries. They speak apprehensively and resentfully of legislation to regulate railroads, on the ground that it is a direct blow at our sacred prosperity. The tactics seem familiar. We are favored with tables showing the enormous amount of money invested; we are pointed to the vast interests wrapped up in our railway systems; we are asked to gaze upon the huge monthly pay-rolls and the great army of employees, and then the question is asked, "What condemnation can be too severe for the man or party that would imperil the ongoing of an industry so vital to the national well-being? Do you not see that American prosperity is at stake?"

At the hands of protected manufacturers, we have been long accustomed to this line of argument. It has often been put in the most brutal form. When Republicans in Massachusetts, whether disgusted at the blind and porcine greed of the extreme high-tariff men, or prompted by an enlightened desire to put fresh life into their own manufactures by admitting raw materials free, have spoken up for tariff reduction, the angry cry has come from Pennsylvania and Ohio: "Stop that, unless you want to see grass growing in the streets of Boston!" To-day, we are beginning to hear the same raucous voices on the part of railway magnates. "Why, we are the true authors and upholders of the unprecedented prosperity of this country, and dare you level an accusing finger, or direct a restraining statute, at us?"

This is a new use of prosperity as a fetich—something to conjure with, something by which to excite unreasonable prejudice and provoke the worst passions of the human breast. There is a sense in which, unfortunately, our national prosperity has become like the great goddess Diana of the Ephesians. We shout about it in the market-place for the space of two hours, if anybody undertakes to do anything which can be alleged to be in despite of our prized idol. We make this a convenient substitute for calm reason. Hysterically to affirm that prosperity is in danger, has been the only political or moral argument needed. It has stayed the hand of all Republican tariff-reformers, from Roosevelt down, these many years. It has killed treaties and blocked reciprocity arrangements. No wonder that the railway interests would like to annex so potent a political force. It is evident that they are trying valorously to do so by creating the impression that the President's attitude, with such State measures as the Public Commissions bill, pending at Albany, spells panic and points to shrunk markets, closed factories, and political upheaval.

In all this matter we need to keep a steady head and hold an even balance. General prosperity is, or may be made, a great national blessing. If it means increasing comfort and health and opportunity and education for the masses of the population; new leisure and power to drill the raw world for the march of mind; the purification of society and of politics, as men are left more free from the struggle for existence, in order to strive for purer manners and better laws —then abounding prosperity may truly bring joy to the heart of philosopher and patriot alike. But there is another side to it. Mounting wealth may mean declining civic duty. As bank accounts expand, consciences may contract. Prosperity may be made use of to induce men in office to "dodge and palter with a public crime." If this be too much the case; if money-getting and money-keeping be made superior to all questions of public justice, then we are bound to say of a state of prosperity thus perverted to base uses, what Wordsworth said of the insensate rush of Englishmen to be rich, a hundred years ago, "This is idolatry."

We do not believe that railroad managers, or monopolies sheltered by the tariff, have anything to gain, in the long run, by attempting to divert attention from the real issue. To identify their own contentment with the nation's well-being will not long be possible. The question really before us has to do with a sound public policy. Should there be a larger publicity in the management of these great properties, which are defined by the law as affected with a public interest? Should the States take firmer control of the railway corporations which they themselves have created? Ought blackleg methods of railway finance to be brought, not only under a moral stigma, but if possible within the reach of the Penal Code? If we answer all these questions in the affirmative, then there is nothing for it but to press on the movement to secure those public ends. Men who oppose, and who raise the old cry that prosperity is endangered, will also raise the old suspicion that, like the alarmed standpatter, what they really fear to be in danger is their license to prey upon the people.

A NEW STATE'S IDEAS.

Chances to fit out a new commonwealth with appropriate laws and institutions come seldom nowadays. The new Constitution of Oklahoma, drafted by a delegate convention for submission to the people next August, is the first such instrument put together since Utah was admitted, more than ten years ago. If there was ever doubt that the people of Oklahoma have ideas of their own, it was dispelled by the deliberations of this remarkable convention, which sat for 115 days and used up so much of the Congressional appropriation that there is serious doubt whether enough is left to pay for the first State election. Oklahoma's freedom does not broaden slowly down from precedent to precedent, but comes all at once and complete. Few vested rights impede the consummation of projects in which the people believe as a matter of abstract principle. Newspaper dispatches call the new instrument "the only State Constitution to be produced under modern conditions." As a matter of fact, it undoubtedly comes nearer than any other document in existence to expressing the ideas and aspirations of the day.

That Oklahoma would adopt a good many so-called "radical" ideas was, we suppose, generally expected; but the actual performance must surprise every one. It is a bad habit of States, which was pointed out by Mr. Bryce, and has grown much worse since his first visit, to embody ordinary statutory provisions in their Constitutions. "Otherwise," the champions of some particular reform sometimes naïvely say, "they might repeal our law if it didn't suit." If the statements of the local press are to be relied on, the new Oklahoma Constitution is absolutely the longest on record. It is so long that the newspapers seem to have no idea of printing its full text until they are paid for it out of public funds. A considerable proportion of this space is filled with matter which in other States appears in the ordinary session laws. That some stones were rejected by the builder must be admitted. Woman suffrage was defeated by a few votes. Negro disfranchisement and the "Jim Crow" car are not mentioned, because of the fear that a Constitution containing them would not be approved by the President. Our best information is that a determined effort will be made to engraft them after Oklahoma is irrevocably a State.

But no other Commonwealth can longer make a claim to be called "advanced." Oklahoma proposes to equal or surpass each of her sister States in that State's own specialty. The draft contains a prohibitory clause far more rigid than the Maine law, in that it forbids the introduction as well as the sale of liquor. Oregon's latest pattern of initiative and referendum is taken over, with direct primary laws as comprehensive as those of Wisconsin and Mississippi, including a practically popular choice of Senators. Elective State officers are forbidden to succeed themselves, after Missouri's plan for preventing office-holding rings. Railways are to be really kept from owning coal lands, as they are supposed to be in Pennsylvania. An elective State railroad commission, with large powers, follows the pattern of Montana. The books of corporations are to be as accessible to State

inspection as they are in Texas. Massachusetts is not more hostile to stock-watering. A fellow-servant law, such as is being fought for by labor organizations in many States, is here a part of the Constitution. So far as we know, this is likewise the first to provide in so many words for a two-cent-per-mile passenger fare.

There is an alternative proposition, to be sure, a Constitution on the old-fashioned plan, confining itself to fundamental law and leaving legislative experiments for future lawmaking bodies. This is a sort of minority report drafted by the twelve Republican members of the Constitutional Convention of 112. They intend to make rejection of the comprehensive and idealistic Constitution their party issue, but, as the indications go, with very meagre chances of success.

That the forty-sixth State is going to be in the long run less level-headed than its predecessors there is no reason to suppose. It is inhabited, as the census shows, by the purest native stock to be found anywhere on the Continent. If all the radical features of the Constitution do not work in practice, they can be amended. The real significance of the experiment is that it reverses the ordinary burden of proof, the customary presumptions of politics. What would be elsewhere entrenched interests or specially privileged corporations must take the rôle of innovators. A spectacle more delightful to the Western eye than that of magnates and captains of industry suing for a chance to enter the State is hard to imagine. In the end, however, Oklahoma, toning down its drastic legislation, is likely to arrive at just about the same pitch which her neighbors have attained by laboriously toning-up their statutes.

WHAT WE REALLY ARE.

Concerning "The American Commonwealth," Mr. Bryce said the other day:

> The book was really written by yourselves. It was put together out of many conversations I had, not only with statesmen in the halls of Congress, but at dinner parties, on the decks of steamers, in smoking cars, with drivers of wagons on Western prairies, with ward politicians and city bosses.

The historian of the distant future who shall attempt to reconstruct the archaic civilization of America in the twentieth century will, in lieu of such sources of information, resort to the advertising sections of our magazines. There the higher critic will find revealed a wealth of sociological data which he will regard as all the more valuable because it was the spontaneous expression of a nation's universal needs and characteristics. "Whatever may have been the ideal conditions in life, literature, and art that the early Americans strove for," Professor Toutsavoir of the University of Tananarivo will say, "there can be no doubt that these two hundred time-stained advertising pages of the *Straphanger's Monthly* tell us with infinitely greater clearness what these primitive Yankees really were."

"What was the average size of the American family about the year 1907?" Professor Toutsavoir will ask. And he will answer, "About twelve or thirteen. That fact is clearly established by a succession of full-page illustrated advertisements dealing with the merits of various speaking machines, games, and literature for home reading. The execution, judged by the standard of modern technical attainments, is, naturally, of the crudest; and time, too, has done its destructive work; but the trained eye can still make out a circle of faces ranging from gray-haired age to early infancy, grouped about a phonograph discoursing the sweetest music, to judge from the radiant delight in every countenance. We turn to another scene, entitled 'The Pleasures of Home.' A mechanical piano is sounding one of our own Chopin's marches under the soft touch of a slender young woman in white. A youth with extraordinarily broad shoulders leans against the piano, dreamily studying the upturned face of the player. Behind her, attentively listening, are three young girls, remarkably alike in appearance, the eldest about thirteen, the youngest about nine. In one corner, on the floor, two little boys and a golden-haired infant are busy at their games with building-blocks and picture-books. Watching them fondly we see a matronly looking woman of thirty-five smiling up at a strong-faced, clean-shaven man, some five years her elder. In a cosey nook, half-concealed by curtains, are an aged couple, listening in religious silence. With such evidence before us we may be certain that the whole outcry about race-suicide which has come down to us from the writers and politicians of that time had no other basis than a desire for notoriety and public office."

What were the chief occupations in those days? Professor Toutsavoir will answer his own question: "First, the painting of cottage roofs and varnishing of house floors and furniture. One industry was completely monopolized by men; the other seemed largely in the hands of the women. Contrary to what is usually believed, the Americans of that period builded for all time and with a sensitive eye for the beautiful. Else what is the significance of these various pigments and stains advertised to keep the roof from leaking for fifty years and not to fade? Nor is there more truth in the accepted belief that the American women of that time were the spoiled creatures of idleness and pleasure. We see them in these same pictures, unmindful of their graciously white fingers, their intricate coiffures, and their exceedingly expensive gowns of silks and lace, engaged in the simple tasks of varnishing the legs of an old piano, restoring a gilt chair to its pristine glitter, or even mirroring their fair faces in the sheen of highly polished oak flooring.

"Second in rank among American industries was the organization and management of correspondence schools. Yankee genius and system had totally dispensed with the need of personal instruction in every branch of knowledge, in every trade and profession. The universities were gradually closed and their faculties were concentrated in two or three great centres, whence by letter, telegraph, and wireless communication they disseminated instruction in law, medicine, music, mind-reading, financial speculation, tunnel-engineering, sermon-writing, executive ability, and horsemanship. Only inferior in importance to the correspondence-school managers were the compilers of voluminous popular histories, literary and natural science 'libraries,' and books of reference. Here again the intense domesticity which was so characteristic of the age finds a striking example. I have before me as I write a picture showing an entire family absorbed in the perusal of ten out of the sixty-eight volumes of 'Stories and Histories of All Ages.' The head of the family, with his faithful help-mate by his side, is reading the story of Paul's journey to Tarsus; two young lads are in the midst of Hannibal's exploit of tying torches to the horns of a number of infuriated bulls and letting them loose against the Romans; the baby is shrieking with delight at a picture of a hunter proudly erect among the carcasses of a large number of huge Rocky Mountain grizzlies.

"As to the philosophical beliefs of the early Americans, only a word can be said, or, for that matter, need be said. In their thoughts and their actions they were purely monistic; that is, they were impressed by the essential unity which rules in the universe. This is shown particularly by their inclination to find a remedy for all human ills, political, social, or bodily, in a single principle. There was a very large school, for instance, which believed that sin might be banished and death indefinitely postponed by adopting an exclusive diet of peanuts and grape-fruit; and some extremists within the school even asserted that to eat both peanuts and grape-fruit was irrational dualism, and so went in for peanuts alone, dubbing their opponents 'pragmatists.' Others gave their adherence to uncooked cats, others to all-wheat bread, others to dried figs, others to bananas, others to buttermilk, and so on. This absolute insistence on unity of purpose and aim has come down to us classically embodied in the pregnant saying attributed by

some to the semi-mythical Nebraska Man, by others to the poetess who called herself the Girl from Paris: 'I want what I want when I want it.'"

IS LITERATURE THE FOE OF ART?

Ever since Manet and the Impressionists came to their own we have had it dinned into us that to be literary is about the most despicable quality in painting or sculpture. This has become the very gospel of the studios. Atmosphere is held to be the only thing really worth painting, linear pattern or balance of color blots the only grace admissible. Such exaggeration was inevitable, and in a way salutary, for the painter's art had so fallen that it was necessary to regain consciously and with pain certain rudimentary conceptions of design that at all healthy periods of art had simply been taken for granted. The artist had to assert himself, a little bumptiously perhaps, against the mere illustrator or story-teller.

Inconsistently, these worshippers of pigment and detractors of letters appealed to precedent. Let us imitate the unfettered fantasy of a Giorgione, they said. Let us emulate the wilder inventions of the Gothic masters. Now, recent investigation has shown that not only the exuberant geniuses of the Italian Renaissance were in league with literature, but actually submissive to it. Herr Wickhoff has taught us that we must interpret the fantasies of Titian and Giorgione in the light of well-known Latin texts. We have learned that Botticelli must be regarded as in a fashion the illustrator of Poliziano and Leon Battista Alberti, while even the most savage and personal compositions of a Piero di Cosimo were dictated, stroke by stroke, by the hexameters of Ovid. And the artists of the revival did but imitate their mediæval predecessors. For every composition on stone or plaster it is safe to assume that there is a corresponding text. Every month some new parallel comes to light. Moreover, learned men intervened directly to see that the texts were scrupulously followed, nay, frequently prescribed the entire scheme. One reads, for example, that when Matthieu de Layens, architect of the splendid Hôtel de Ville of Louvain, asked instructions as to the reliefs on the bases of the statues of the façade, he was referred to a learned cleric and to a Dominican master in theology.

The result of such collaboration between bookmen and artists seems—surprisingly in view of current theories—to have been only beneficial to art. The painters and sculptors found in such definition of their themes not an embarrassment, but a steadying force—a point of departure sometimes for the loveliest and most solemn inventions the world has known. We are assured, indeed, that the artist prevailed in such case only by evading the conditions of his theme, and at certain periods this has been true; but nobody will, we imagine, assert that Giotto was a great decorator, in spite of the Bible and the Franciscan legend, or that the so-called allegories of Titian are beautiful in spite of the advice he got from his Humanist associates. The fact is quite the opposite. These subjects afforded a friendly soil in which the flower of visualized invention grew lustily. It is the absence of legend and tradition, the failure of all guiding principles except the love of landscape, that makes our art, with all its technical finesses and its experimental audacities, seem small and incomplete in comparison with the great art of the past.

It is unlikely, of course, that the alliance between letters and the representative arts can ever be renewed on the old terms. The artist will hardly again accept a position of tutelage, and, indeed, the right of letters to assume the superior position is by no means so clear as it formerly seemed to be. But just because the artist to-day stands on his own feet and takes orders from no one, it is doubly incumbent on him to enrich his store of visual impressions with those of the mind's eye. It is noteworthy that, the landscapists apart, the most inventive painters of the century just passed have gladly accepted the aid of literature. We find a Delacroix, a Burne-Jones, a Puvis de Chavannes, all fervent lovers of history and legend; while Watts, about the only painter of the century who made allegory mean anything vital, insisted ever that he was a painter of ideas; in other words, associated his work with that of the littérateur. These artists, if not in their narrower practice, at least in their course of life, may well serve as a model for the young lions of to-day. Not by denying himself the use of any faculty does the artist become great, but by cultivating all harmoniously and making all minister to the perceiving eye and recording hand. Books will no longer serve as a repertory in the old sense—for the temper of the age is no longer iconographic; but they will as ever powerfully stimulate the creative spirit. Even more, perhaps, the association of artists with literary men is likely to be, if only incidentally, helpful to their art. Mind stuff is, after all, a transmutable substance, and there may well be a point at which beautiful invention in whatever medium finds a common focus. The late Eugène Carrière, one of the most remarkable examples of the ratiocinative artist, used to say that "to the literary man ideas suggested forms; to the artist forms, ideas." The epigram hints at what one art may supply to the other, the representative arts deterring the writer from too vague an indulgence in meditation, the literary arts similarly emancipating the sculptor or painter from too barren and unintellectualized an exercise of vision.

Is it not time for us to reject the cant that what is good for every other human being is bad for the artist? There is a law of sacrifice in all success, but shall we contend that what enriches the personality in every other capacity cripples it before canvas or clay? When this seems to be the case, as it did with a whole generation of trivial anecdotalists and pompous aspirants to the academic honors, the trouble has been not too much literature, but too little art. An illiterate Meissonier or Gérôme would have painted no whit better, but probably far worse. We must admit that many persons with but the slightest artistic vocation—and possibly with the literary temperament—have tried to be painters and sculptors to the sorrow of us all. But against such misfits there is no immunity in any calling. Surely, no one who is born an artist need fear to compromise his gift by much reading and association with the makers of books—unless, indeed, he would deny that brains may still profitably be mixed with pigment.

BRUNETIÈRE AND HIS BOOKS.

The library of the late Ferdinand Brunetière, as we have already noted, is offered for sale; and an American has attempted to buy it for Harvard. Piqued by such presumption, Victor Giraud has written to *Figaro* with the avowed purpose *d'inspirer à quelque bon Français le désir efficace de retenir chez nous ce véritable trésor national.* M. Giraud describes this library—which contains twelve or fifteen thousand volumes—as skilfully chosen, patiently assembled, ingeniously classified, and, above all, in the case of a great number of the books, interestingly annotated. Brunetière, it seems, was a lover of beautiful books, elegant bindings, and rare editions. He had the collector's taste, though, we infer, he was too well balanced to let that taste run into madness. He belonged, according to M. Giraud, to the tribe of Sainte-Beuve and Silvestre de Sacy. His intellectual range was almost encyclopædic. Theology, history, philosophy, æsthetics, science, the classics, and modern belles-lettres—in all these subjects he found food for his mind. He had many first editions; indeed, he used to say that it is in a first edition that you see a writer face to face; in later editions you come to him through the medium of his publishers and editors; you are at least a step removed. He preferred Corneille in the edition of 1663, the Montaigne of 1588 or 1595; and in his view the most beautiful Ronsard is that of 1584. When we learn that most of the books over which he displayed such enthusiasm are in his own library, we can see why French bibliophiles

tremble lest Americans shall carry off the *trésor national.*

There are also volumes whose price in the market would probably be far lower than the price of such rarities as we have just mentioned, but whose value to a critic and a student of literature might be far greater. For example, there is the "Tableau de la poésie française au seizième siècle," with all the manuscript corrections and additions that Sainte-Beuve had prepared for a new edition. There is also a copy of Pascal's "Pensées," which Sainte-Beuve, according to his habit, had liberally annotated in the margins. These notes, M. Giraud assures us, are no less interesting than those of Sainte-Beuve on La Bruyère, which have been deemed worthy of publication.

But better than all are Brunetière's own marginalia. We have no patience with the impertinent scribblers who deface the books of public libraries with their silly comment. Nothing exasperates a sane reader more than to be interrupted by such childish irrelevancies. But the passing reflections of a Sainte-Beuve or a Brunetière are a different thing. These men of letters were accustomed to read with pencil in hand, underlining striking passages, and jotting in the margin the ideas which the reading suggested. Here you have a critical article in the making, "Les livres annotés de Ferdinand Brunetière," says M. Giraud, "sont comme le prolongement de son œuvre et de son action." In hastily scribbled words, which often appear so casual and disconnected, one may yet perceive the development of Brunetière's thought, of his critical principles, and of those convictions which made him—like Burke of a century before, and yet so unlike—one of the great pleaders for conservatism and the established order. The volumes which M. Giraud cites as of special significance are those of Bossuet, Vinet, Fromentin, Taine, Renouvier, Eugène Burnouf, De Maistre, and Renan.

The annotations on Renan's writings are perhaps the most illuminating; for there, according to M. Giraud, one can trace the principal steps in the religious and moral evolution of Brunetière. When Renan, in his "Histoire des origines du Christianisme," asserts that one finds in the books of the Buddhists parables of exactly the same tone and *facture* as those in the gospels, Brunetière, defender of the faith once delivered, underlines *exactement*, and writes "C'est ce que je nie!" For some of Renan's fine-spun metaphors Brunetière has nothing but the single harsh word "Galimatias!" Renan's endeavor toward an ingenious and rational explanation of the raising of Lazarus provokes from Brunetière a comment to which rationalists as well as Catholics may say amen: "Deny the whole thing outright and spare us your absurd explanations!"

In this sentence, we cannot but feel, is summed up the attitude of men, like Brunetière and Newman, who see no half-way house between full surrender to the Church of Rome and blank agnosticism. In the "Apologia" Newman laid before us the slow movement of his mind from Anglicanism to Catholicism. Once started in that direction, he saw no place to stop till he reached the end. The other way lay religious and moral anarchy, the destruction of the bonds which hold society together—madness. The parallel between Brunetière and Newman we need not press closely; but if M. Giraud has not read into these scattered phrases pencilled in the books of Renan a deeper meaning than they can bear, they are the raw material of Brunetière's "Apologia." He and minds like his must repose in a positive and external authority; he would look beyond himself and his narrow experience for the Great Imperative. From the philosophizing that resolved the God of Israel and of Christendom into a myth, the mere vision of a poet, or the hero of a folk-lore tale, he shrank with dread. Penetrated as he was with this conviction that outside the pale of orthodox belief all things were, as Thomas à Kempis has it, "full of trouble and unrest," he could look upon the "rational" explanation of miracles as only a paltering with the eternal verities. Lazarus rose and Christ rose; or else we and our creeds are such stuff as dreams are made of; and our little life is rounded with a sleep. It is because Brunetière can gather into a few poignant words the argument of a volume and the position of a whole school of thinkers that his annotated library may indeed be a national treasure.

NEWS FOR BIBLIOPHILES.

In two sessions on April 8, the Anderson Auction Company of this city will sell the autograph collection of John D. Crimmins, the most notable offering of autographs in New York in a long time. The most important single feature is the complete set of autographs of the signers of the Declaration of Independence. The series of fifty-six pieces, of which thirty are full autograph letters, signed, and only two (Lynch and Gwinnett) are cut signatures, will be sold as one lot. Many of the specimens are very fine. The series of governors of New York is very long, beginning with a D. S., dated 1664, of Peter Stuyvesant. A number of scarce names are included, among them Sir Richard Nicholls (the first English governor), Jacob Leisler, Henry Sloughter (who served for four months only), Benjamin Fletcher, Lord Cornbury, Rip Van Dam, and Sir William Tryon (the last colonial governor). The mayors of New York city form another interesting series. Among other American autographs are Daniel Boone, a characteristic and interesting A. L. S.; Thomas Jefferson, a fine letter on the question of freeing the slaves; Gen. Henry Knox, A. L. S., referring to the evacuation of New York by the British; Lafayette, a fine A. L. S., three pages, 4to, to Thomas Jefferson; Gen. Richard Montgomery, A. L. S., his last letter, written on the night of December 31, 1775, before his attack on Quebec; William Penn, A. L. S., to the President and Council of Pennsylvania; Washington, a three-page memorandum in his autograph, being a plan for attacking the British in New York; Lincoln, a fine one-page war letter, dated Executive Mansion, May 27, 1861; letters of Grant, Sherman, Sheridan, Longfellow, Lowell, etc. The evening session is devoted to foreign autographs, royalty, famous English and Continental statesmen, authors, actors, and scientists. Two letters of Robert Burns to John Richmond, when Burns was expecting to sail for America to escape imprisonment, are among the most interesting. The series of autographs of Popes and Cardinals of the Catholic Church is very unusual.

On April 11 and 12, two sessions each day, the Anderson Company will sell Part V. of the library of Wilberforce Eames. This section includes the history, languages, literature, religion, ethnography, folk-lore, etc., of western, central, and northern Asia and Egypt. The catalogue has been well prepared, and specialists will find many books which seldom turn up in an American auction room.

On April 9, 10, and 11 the Merwin-Clayton Sales Company offers some rare items. Among the early English books are two copies of "Paradise Lost," first edition, one with the fourth title, 1668, the other with the fifth title, 1669; "Paradise Regained," 1671, first edition; "England's Helicon," 1600, a collection of verse by various authors, ascribed to the editorship of John Bodenham, of which no copy seems ever to have been sold at auction in this country; Brathwaite's "Barnabee's Journal," the extremely rare first edition, printed about 1648, probably the Foote copy, which sold for $200 in 1895; Browne's "Britannia's Pastorals," both parts, 1613-1616; Chapman's "Epicede, or Funerall Song on the Death of Prince Henry," 1612, as usual lacking the plate of the hearse; Samuel Daniel's "Works," 1602, his "Civile Wares," 1609, and the "Whole Works in Poetrie," 1623, all fine copies; Drayton's "Poems," Smethwicke's edition, about 1619; also his "Battaile of Agincourt," 1627, the latter in the original vellum; Lilly's "Sixe Court Comedies," 1632; Spenser's "Colin Clouts Come Home Againe," 1595, and "Complaints," 1591, both good copies; Sir John Suckling's "Fragmenta Aurea," 1646, first edition; and plays by Jonson, Middleton, Dryden, etc. The early printed books are numerous and important, including an uncut copy of Juvenal, Milan, 1476; two early books on music, Martinez's "Arte de Cantollano," Zaragoza, 1508, and Gafurius's "Regii Musici," 1518; and books from the presses of Aldus, Elzevir, and Bodoni. First editions of eighteenth and nineteenth century English writers include Coleridge's "Poems on Various Subjects," 1796, first edition; Cowper's "Olney Hymns," 1779, first edition; Goldsmith's "Retaliation," 1774, and "The Haunch of Venison," 1776, both first editions and both rare; a number of first editions of Pope; Tennyson's "Poems," 1842, boards, uncut; and a set of the yellow covered Miscellanies by Thackeray, all first editions. The auto-

graphs include an L. S. of Washington; an A. L. S. of Nicholas Bacon, the instigator of Bacon's Rebellion; an autograph receipt for fifty ducats by Raphael for painting done in the Vatican; a series of autographs of the Presidents, mostly full autograph letters, signed, including Washington, Lincoln, and Taylor.

On April 10 and 11, C. F. Libbie & Co. of Boston sell the library of Major William H. Hodgkins of Somerville, Mass. The collection relates mainly to the civil war, and includes a remarkable series of eulogies on Lincoln, books on slavery, books printed in and relating to the Confederate States. and regimental histories, especially of Massachusetts.

At an auction at Sotheby, Wilkinson & Hodge's, London, March 16 and 17, Pope's "Dunciad," 1728, first edition, brought £55; the Kelmscott Chaucer, bound by Cobden-Sanderson, £61; the original manuscripts of Bret Harte's "The Devotion of Henriquez," "Barker's Luck," and "Susy," £82; Sidney's "Arcadia," 1590, first edition, imperfect, £100; Ben Jonson's "Celestina," 1631, with his autograph, £50; a fifteenth century breviary on vellum, £70; Shelley's "Queen Mah," 1812, first edition, £53; "Adonais," Pisa, 1821, £92; Shakespeare's Second Folio, 1632, Aspley imprint, £220; "King Glumpus," 1837, £153; "The Exquisites," 1839, £76. Both these rare volumes were illustrated by Thackeray, and the text was formerly attributed to him; but it is now believed to be by the late John Barrow. A copy of "King Glumpus" brought £101 in 1906; and of "The Exquisites," £58 in 1898.

First editions of German authors have not run a sensational course in the market, but the tendency is upward, as a few comparative auction prices will show. Brentano's "Des Knaben Wunderhorn" has passed from 95 to 220 marks in three years; Lessing's "Minna von Barnhelm," from 115 to 160; Goethe's "Goetz," always a rare item, from 310 to 570; "Hermann und Dorothea" from 54 to 85; Schiller's "Don Carlos" from 46 to 190, and the famous first edition of "Die Räuher" from 405 to 2,650 marks, for an uncut copy last winter.

Correspondence.

FRIEDRICH BLASS.

To the Editor of The Nation:

Sir: For many years I have been honored with the friendship of Prof. Friedrich Blass of Halle, and I should like to add to your words of appreciation of his work. He was one of the most incisive, independent, and learned of the classical philologists of Germany. No living scholar has published so many important volumes, covering so large a part of the field of Greek philology. He studied at Bonn in the great days of Welcker, Otto Jahn, and Ritschl, and received his degree of doctor of philosophy when he was only twenty years old. His dissertation treated of the rhetorical works of Dionysius of Halicarnassus—the first fruits of researches in a field where he has been the chief authority for forty years. He did more than any one else to call attention to the important observations and principles of the ancient rhetoricians.

From the study of rhythms, he became a leader in the investigation of the principles of Greek metres. His doctrine of rhythms led him to more changes in the texts of the Greek orators than his colleagues generally have approved, yet in most matters his philological judgment was eminently sane. For instance, his treatise on the pronunciation of Greek was the first sensible and learned treatment of this subject since the sixteenth century. For more than a third of a century this has been the standard authority on the matter. His revision of the first half of Kühner's "Greek Grammar," in two large volumes, presents the linguistic facts clearly, accurately, and almost completely.

For the study of the Greek Testament, Blass did more than any other classical scholar since the time of Lachmann of Berlin, seventy years ago. His grammar of New Testament Greek (which has been translated into English), while not so voluminous as its two chief earlier rivals, yet contains more exact and valuable information than they, with regard to the language. In a philological edition of The Acts of the Apostles, he called attention to the importance of the Cambridge Codex Bezæ, and the discussion thus begun has not ended yet. A critical edition of the Epistle to the Hebrews was intended chiefly to show that the author of that letter was attentive to rhetorical rhythms.

By his success, many years ago, in deciphering the papyrus fragments of an ode by Alcman, which had baffled all his predecessors, Blass gained fame as a paleographer. This fame has been increased by his work on Aristotle's Constitution of Athens and on the Odes of Bacchylides—both, as your readers will remember, recovered from the tombs of Egypt in recent years. Of the Constitution of Athens he succeeded in reading an important page or two, which were thought to be irretrievably lost; and probably no one but the original editor, Dr. Kenyon, has done more than he to determine the proper order of the many fragments in which the manuscript of Bacchylides was found. A British scholar said that Blass seemed to know by intuition the proper place for each fragment of Bacchylides. But when this remark was quoted to Blass, he shook his head gravely and said that it was not intuition at all, but *very hard work*. He had committed to memory the twelve or thirteen hundred verses of Bacchylides, carefully observing all lacunæ, and had memorized also the forty or fifty fragments for which no place had been found. This was a difficult matter, since many of the fragments were not long enough or broad enough to contain any independent sense. These fragments revolved in his brain, and each was tried in one connection after another until it had found its proper resting place. Blass had "an infinite capacity for taking pains."

Naturally, after his work on Alcman, Aristotle, and Bacchylides, he has been the chief classical adviser in the publications of the Graeco-Roman Branch of the Egypt Exploration Fund. Never has his brain seemed more fertile than of late. Within the last two years he published a revision of his edition of Andocides, with critical apparatus; a work on interpolations in the "Odyssey," in which he argued strongly for the unity of composition of the poem; and an edition of the "Choephoræ" of Æschylus, with critical and exegetical commentary. A similar edition of the "Eumenides" of Æschylus is in the press. If one should reckon new editions, in which a work has been reset, Blass has published on the average a volume a year, since he took his doctor's degree, for forty-five years.

Since he has been at Halle, he has been in rather close connection with American scholarship, for no German university but Berlin could draw more American classical scholars than Halle, with Blass, Dittenherger, Wissowa, Robert Bechtel, and Edward Meyer in its faculty. Blass had a kindly, generous spirit. Though his views were clearly formed and expressed. he seems never to have been engaged in bitter controversy. No scholar has been more frank in acknowledging his errors—which he could well afford to do. He passed away quietly in the night following the close of the winter semester, having concluded his lectures that day, and having spent the evening with a company of friends.

The family of Professor Blass would be glad to dispose of his library in bulk to some American institution of learning. Any inquiries on this subject may be addressed to Frau Professor Blass, Lafontaine strasse 17, Halle, Germany.

Thomas D. Seymour.

Yale University, March 28.

THE ALTAR TO THE FATHERLAND.

To the Editor of The Nation:

Sir: In reference to your comment in to-day's issue of the *Nation* concerning the monument now in process of construction upon the Capitoline Hill, permit me to add that there is still hope of an adherence to the original plans of Sacconi, whose untimely death was the sole spur to this piece of jobbery. The Florentine weekly, *Il Marzocco* of March 17, gives a full account of a recent meeting held at Florence of the Leonardo da Vinci, a society for the furtherance of art and humanistic study. This indignation meeting was made memorable by the attendance of an imposing number of artists, scientists, and men of letters. The resolutions of this assembly express at once such complete satisfaction in Sacconi's plans for the great monument and so unanimous a condemnation of the lobbying architects (who hardly waited until Sacconi was dead before they tried to railroad through Parliament a measure to change the first specifications) that it is reasonable to hope for a cessation of the garish works now going forward and for a return to the originally accepted ideas. These, if unworthy of a sternly classic taste, are, after all, essentially Roman in their appeal. In one of her characteristic papers upon things Italian Mrs. Wharton holds a brief for the floridly Spaniardized Rome, which is the most obvious of the four Romes that one may come to know and to love. The dignity of the elder age is gone, the noble simplicity of the early Christian period is likewise a thing of the past. Pontifical Rome and latter-day Rome vie with each other in offending every sense save, perhaps, that of proportion. However, it

may be folly to stand out against Mrs. Wharton's insistence, in which case we may frankly enjoy Sacconi's design for the "Altar to the Fatherland," which, after everything possible is said in its disfavor, is infinitely more beautiful than the proposed substitute.

We trust that the cause of good taste, honesty, architectural consistency, and mere justice to Sacconi's memory—a cause championed so strenuously during these long months by the *Marzocco*—will triumph, and that Florence will, as is her wont, show herself to be on the side of the right.

T. D. B.

Cambridge, Mass., March 28.

A PROTEST FROM ARVÈDE BARINE.

M. LE DIRECTEUR DE LA NATION:

Il me semble qu'il serait digne de la *Nation* de protester contre des mœurs qui ne sont vraiment plus de notre temps. Un éditeur de New York, Edwin C. Hill, vient de publier une traduction anglaise de l'un de mes ouvrages, "Alfred de Musset," sans en avoir demandé l'autorisation ni à moi ni à mes éditeurs, MM. Hachette. En France nous appelons cela un vol. Est-ce qu'en Amérique ces actes de piraterie passent pour honnêtes? ARVÈDE BARINE.

Paris, 16/3/'07.

Notes.

George W. Jacobs & Co. announce the following for publication this spring: "On Art and Artists," by Max Nordau; "The Negro in the South," by B. T. Washington and W. E. B. Dubois; "Judah P. Benjamin," by Pierce Butler; "The Lord's Prayer: a Sonnet Sequence," by F. H. Williams," and "With God in Prayer," by the Rt. Rev. C. H. Brent.

There is to be a new series of religious selections published by Messrs. Jack of London (the American publisher is not yet announced) under the title of "The Library of the Soul." It will include volumes on St. Augustine by the Bishop of Southampton; Thomas à Kempis, by the Bishop of Ripon; St. Francis de Sales, by Mr. Baring-Gould; Savonarola, by Canon Benham, and Cardinal Newman, by Wilfrid Meynell.

When Kipling's "They" was published many readers were curious to know the meaning of "the egg" or colors supposed to be emitted by the soul according to its emotional moods. Such inquirers may be interested to know that John Lane Co. has announced a book dealing with this subject. It is called "Man Visible and Invisible," and contains a series of color plates from the London Theosophical Society.

Zola's early letters, "Lettres de Jeunesse," are to be published within a few weeks.

Albert H. Smyth, with the tenth volume, completes his "Writings of Benjamin Franklin" (The Macmillan Co.). The letters and papers of the last year of Franklin's life possess a pathetic value, but show no diminution in mental power or in breadth of his public interest. His plea for the teaching of English and preservation of the purity of the language, his criticisms on the Pennsylvania State Constitution, and his address to the public from the Pennsylvania Society for Promoting the Abolition of Slavery prove this interest. Ten essays of doubtful or unknown dates follow. In the ten volumes the editor has well performed the promises made, for he has given a purer text, a more careful editing, and no little additional matter. His notes have been restrained and intelligent, conveying many a suggestion of the richness of the Franklin manuscripts in the American Philosophical Society. It was not to be expected that he would be able to change materially the broad outlines of Franklin's output, but he has discovered interesting material, located in time and place what was open to doubt, and eliminated what has been erroneously attributed to Franklin. As a result he has superseded former editions of the "Writings," and his work must be regarded as the standard, both in form and matter. The volume has a very full index to the set, and this alone makes it extremely useful. Two portraits of Franklin are given, one being the Earl Grey gift.

More than 350 pages of volume x. are occupied by a "Life" of Franklin. Completeness would be impossible in such space, and Mr. Smyth has given only the outlines of a biography, making his chapters convenient pegs on which to hang material discovered since his earlier volumes were published. Some of this material is very interesting. Franklin's success at the head of the colonial post office is developed from the postal accounts, a success highly commended by his superiors, and justifying the original "purchase" of the position. Of Franklin's nepotism the editor says: "He looked after them all: brothers, and cousins, and nephews, and brothers-in-law drew salutary incomes from public offices." Franklin's own list of his services in the colonial Assembly (pp. 187-196) is very suggestive, and his marginal notes in contemporary political pamphlets are now printed for the first time. For his diplomatic service the Stevens Facsimiles are drawn upon, and the fragments of a diary kept by Franklin only raise a keep regret that the entire record was not preserved. The contents of his wine-vault, his habits of drinking wine, and his correspondence with his woman friends in France picture his social life and the esteem in which he was held. The chapters are rather sketchy and do not hang together well, but they contain original matter and some keen criticism. Several errors in the French printed on p. 327 make the sentences meaningless, and the word *import* on p. 47 should be *impost*, a not uncommon but sometimes misleading error. The French agent mentioned on p. 300 was Bonvouloir.

Prof. William I. Thomas's "Sex and Society" (The University of Chicago Press) is mainly a compilation of articles which have appeared from time to time in the *American Journal of Sociology* and other periodicals. The first paper, on the organic differences in the sexes, paves the way for discussions of such topics as sex and primitive social control, sex and social feeling, the relation of sex to primitive industry and morality, and the psychology of exogamy and of modesty and clothing. The author's thesis, and the particular contribution of his volume at this point, is that while differences in bodily habit between men and women, especially the greater activity of man and the more stationary condition of woman, have had "an important influence on the social forms and activities and on the character and mind of the two sexes," the differences are not to be described in terms of superiority and inferiority, but in terms of "adaptations to different and specialized modes of functioning." The data upon which the conclusions rest, though drawn from a wide area of social observation, are admittedly incomplete; but Professor Thomas is commendably cautious in his inferences, and does not hesitate to point out the weak spots in the chain of evidence. Readers who are not specialists are likely to be most interested in the last two papers, on "The Adventitious Character of Woman" and "The Mind of Woman and the Lower Races." The former is an extremely suggestive discussion of the changes in character and habits which have resulted from the attempt of woman to adjust herself to a social environment dominated by the activities of man; while the latter, rejecting as unproved the assumption that the brain of woman is inferior to that of man, finds in social rather than biological conditions the fundamental reason for the differences in intellectual expression which characterize the sexes. We do not imagine that Professor Thomas holds any brief for the so-called "rights" of woman, but he has certainly put the case in an interesting light.

The Early English Text Society has just sent out four new publications: "The Brut, or the Chronicles of England: Part I. From the Earliest Times to the Battle of Halidon Hill, A. D. 1333," edited by Dr. F. W. Brie; "The English Register of Oseney Abbey, by Oxford, written about 1460," edited by Dr. Andrew Clark; revised edition of "The Book of the Knight of La Tour-Landry, compiled for the Instruction of his Daughters," edited by the late Thomas Wright, and corrected and added to by Dr. Furnivall, J. J. Munro, and Miss Evelyn Fox; and "Mirk's Festial: a Collection of Homilies," edited by Dr. Theodore Erbe.

Railway Routes in Alaska, by Alfred H. Brooks, geologist in charge of the Alaskan division of the Geological Survey, is the subject of greatest interest in the *National Geographic Magazine* for March. He treats his theme with reference to the resources of the country, showing by maps the gold, copper and coal districts. His conclusion is that there is justification for a trunk line from the Pacific seaboard to inland points, with branches and feeders. The estimated cost would be $35,000 a mile. He says, however, "that more facts are needed before scientific deductions can be drawn of the best route *for immediate construction.*" (The italics are his own.) A trip to the remarkable rock of Sigiri in Ceylon is described in her characteristically entertaining way by Miss Eliza R. Scidmore. The frescoes on the face of the rock and the archæological remains on the summit, 600 feet above the plain and accessible only by suspended ladders, give it a peculiar interest. There is a brief account of the three won-

derful natural bridges in southeastern Utah, with reproductions of oil paintings by H. L. A. Culmer; and a striking series of pictures of the Maoris of New Zealand, in many respects the most remarkable savages with whom the white man has come in contact. In consequence of the report of a French vessel of the discovery, on January 18 of this year, of a reef in the unexplored part of the Pacific where the Levant met her mysterious fate in 1860, immortalized in Dr. E. E. Hale's "Man Without a Country," James D. Hague, who conducted an exploration of this region in the U. S. S. Tacoma in 1904, says that a complete survey of the region should be made in the interests of commerce and navigation.

The Press of the University of Glasgow, represented in this country by the Macmillan Company, has added to its beautiful reprints of the classics of adventure, travel, and discovery, two volumes containing Captain John Smith's "Generall Historie of Virginia, New England, and the Summer Isles," "The True Travels, Adventures, and Observations," and "A Sea Grammar, With the Plaine Exposition of Smith's Accidence for Young Sea-men." By way of preface, there is a brief sketch of the author's life. Captain Smith's works, of so much interest to historians of America and collectors of Americana, had already been accessible in several editions. These volumes, however, with their large, clear type, good paper, and admirable reproductions of maps, illustrations, and title-pages, should find a place in many private and public libraries.

In the same series a single volume is devoted to "The Totall Discourse of The Rare Adventures and Painfull Perigrinations of long Nineteene Yeares Travayles from Scotland to the most famous Kingdomes in Europe, Asia, and Affrica," by William Lithgow. The "Totall Discourse," first printed in 1632, was reprinted in 1640, 1682, 1770, and 1814. Since it is therefore out of the market, the new edition is particularly welcome. During the years 1609 to 1629 Lithgow travelled through all parts of Europe, Asia Minor, and northern Africa. According to his own statement, he tramped some 36,000 miles; and he was frequently in peril from storm and shipwreck. In 1620 he was terribly tortured by the authorities of Malaga—an incident which he relates in great detail. His book, written with Elizabethan freedom of speech, contains, together with a good deal of dull description, many interesting sidelights on the social and industrial conditions of the countries which he visited. He speaks always with a furious hatred of Catholics, whom he accuses of every imaginable crime. He is equally furious in his admiration of his native country, Scotland. Here is one of his patriotic outbursts:

> For courteous penetrating lenity; industrious tractability; prompt and exquisite ingeniosity; nobly taught, vivacious, & vertuous Gentility; humane, and illustrious generosity; inviolate, and uncommixed nationall pedegree; Learned, Academicall, and Ecclesiasticke Clergy; for sincere Religion, and devoute Piety: affable and benevolent Hospitality; civill & zealous orders in spirituality; so docible a people to supreame regality; and for true valour, courage, and magnanimity; there is no Kingdome or Nation within the compasse of the whole universe, can excell, or compare with it.

The Senate of Cambridge University, England, accepted in 1904 a benefaction from Dr. Stanton, Ely Professor of Divinity, for the establishment of a lectureship in the philosophy of religion. The first series of lectures, delivered by Vernon F. Storr, on "Development and Divine Purpose," is now published in book form (New York: E. P. Dutton & Co.). Mr. Storr, who is a fellow of University College, Oxford, seeks to reconcile the ideas of purpose and evolution and to find the larger truth to which both Paley and Darwin contribute.

An endeavor altogether deserving of commendation is the reprint of Benjamin Jowett's essays on New Testament subjects, including the well-known essay, "The Interpretation of Scripture," from "Essays and Reviews," fifth edition, 1861, and the "Dissertations" from the "Epistles of St. Paul" (1859) ("The Interpretation of Scripture and other Essays." New York: E. P. Dutton & Co.). Sir Leslie Stephen's discerning and appreciative paper on "Jowett's Life" from the *National Review* of 1897 forms the preface to the volume. The book is a model of the publication of valuable material in convenient form at a remarkably low price.

"Heroines of French Society in the Court, the Revolution, the Empire, and the Restoration," by Mrs. Bearne (E. P. Dutton & Co.) contains sketches of the lives of four women: Madame Vigée Le Brun, La Marquise de Montagu, Madame Tallien, and Madame de Genlis. Scraps of contemporary history are interwoven; a number of photogravure portraits are scattered here and there; and the whole makes a fairly readable volume. One cannot help wondering, however, at the title; for no real heroine appears anywhere. These four women, living in times of much trial, arouse our sympathy, but not for any especially heroic act or even patient endurance beyond what might be seen in studying the lives of many others less prominent socially. Indeed, the book strikes one who is at all familiar with the period as a patchwork affair in which the heroic ladies have, after all, but little part. As an historical study the work has little value; as a group of biographical sketches it adds nothing to what has already been published in a much more useful and entertaining fashion.

The second volume of Ferdinand Brunot's monumental "Histoire de la langue française" (Paris: Armand Colin), a massive and handsomely printed tome of over 500 pages, deals with the sixteenth century. This was a critical period for the language, for then it was that French took the place of Latin as a scientific and literary tongue. It had to pay a hard penalty for its promotion, becoming a prey to grammarians, theorists, and Latinizers; but such was its native vigor that it issued from the trial fundamentally unaltered, save for such changes in sound, inflection, and syntax as came in the natural course of evolution. It may seem astonishing that the encroachment of the vulgar upon the scholastic idiom should have occurred at the very height of the revival of learning; but in reality this movement favored the substitution, for the new scholarship raised the standard of classicism so high as to carry Latin beyond the possibility of everyday use, while the general thirst for knowledge and the increasing abundance of things to say imperatively demanded a rich and familiar medium. How French fought its way through the obstacles of prejudice and tradition, penetrating the various sciences—medicine, mathematics, philosophy, history, and even rhetoric and oratory—making itself a place in schools, and attaining a hitherto unknown glory in literature, is told in detail by M. Brunot. A language thus exalted must needs have a fixed spelling and grammar; the not altogether futile efforts to unify and simplify the orthography make instructive reading for latter-day reformers; and the endeavor to classify and regulate the phenomena of the living tongue, though not particularly effective, appeals to linguistic collectors of all times. The idea of good usage, based on the practice of educated Parisians, was already making itself felt. Far more important, however, than grammatical or orthographical uniformity was a copious vocabulary; and in this respect the sixteenth century rather overshot the mark. A vast influx of Latinisms, Italianisms, and Hispanisms characterizes the style of this transition period; a large proportion of the newcomers failed to justify their adoption. More interesting, but less successful, was the attempt to utilize in literature archaisms and dialect words and to form new derivatives from the ancient stock. All these topics are handled with masterly clearness by our author. Pronunciation, which, in spite of the numerous elaborate treatises of grammarians, is harder to trace in this century than in preceding ages, is lucidly but concisely treated. Inflections are more extensively presented. Full, also, is the discussion of syntax, that part of language in which the Latinizing tendency of the time made the deepest impression.

A number of friends and former pupils of the late Professor Alexandre Beljame have decided to set up in the Sorbonne a medallion in memory of him. Few Frenchmen have written of English literature with such minute knowledge and sympathy, and possibly a stray scholar here and there in this country may wish to contribute to the memorial. Communications may be addressed to M. Clermont, professeur au lycée Janson de Sailly, 20, rue Scheffer, Paris.

In connection with the first centennial anniversary of the University of Berlin, to be celebrated in the autumn of 1910, for which an elaborate programme is already being prepared, a monument will be unveiled to the memory of its first rector, the great philosopher, Johann Gottlieb Fichte. A committee, with the Imperial chancellor, Von Bülow, as its president, has published an appeal for funds for this purpose.

Plans for the establishment of a permanent museum of library aids and supplies at the headquarters of the American Library Association in Boston, are progressing rapidly, and already more than fifty libraries are represented in the collection. With a view to making the collection of value, not only to those who can visit the museum, but to the whole country, the committee in charge is urging all libraries to send their samples in duplicate so that travelling collections may be sent to library schools, associations, and clubs, and to newly organized libraries.

STUDIES IN BIOGRAPHY.

Frederick York Powell. A Life and a Selection from his Letters and Occasional Writings. By Oliver Elton. 2 vols. New York: Henry Frowde. $7.

In a little fragment of autobiography John Addington Symonds says: "I have never been able to take literature very seriously. Life seems so much graver, more important, more permanently interesting than books. Literature is what Aristotle called διαγωγή, an honest, healthful, harmless pastime." Whether or not we approve this sentiment, it should be kept in mind when considering the career of York Powell. Under modern conditions almost every Regius professor of history at Oxford is an author. As a rule it is by the production of books that one lays claim to the chair which within recent memory has been filled by Goldwin Smith, Stubbs, Freeman, and Froude. Save under exceptional circumstances, no man need apply who has failed to publish *une œuvre de longue haleine.* Lord Acton at Cambridge and York Powell at Oxford were both exceptional personages who had broken through the customs of academic procedure and established themselves in a seat sacred no less to literature than erudition. Of the two cases Powell's was the more unusual. Lord Acton, though his writings were scattered and fugitive, had claims which no reasonable being could have questioned for a moment. Apart from his extraordinary learning, he knew modern politics and diplomacy at first hand, was the trusted adviser of Gladstone, the pupil of Döllinger, an aristocrat who was both scholar and man of the world. But Powell, prior to the moment when he succeeded Froude, had only been a law lecturer at Christ Church and a colleague of Vigfússon in editing or translating sagas. Save for a few boyish articles and multitudinous book reviews, his chief contribution to historiography is represented by a single volume, covering but a portion of English history and intended for the use of middle forms in schools. It was neither from lack of knowledge nor lack of power that Powell wrote so little. He seems to have felt with Symonds that life means much more than books.

The present memoir is clever and interesting, but somewhat too diffuse. In the main Mr. Elton has sought to make Powell interpret himself through his correspondence. But the biographer's own contribution is not slight, and he has brought together from Powell's friends many tributes to the richness and generosity of a nature which largely found expression through friendship. We do not wish to damn Mr. Elton's part of the work with faint praise. Much of it is very clever indeed. But we feel sure that self-denying compression would have lent greater impact and enabled the average reader to take away from the book a clearer conception of the character therein revealed. The point, however, is one which we do not care to dwell upon, since the memoir exactly as it stands is a valuable, vivid record of a life which deserves to be held in memory and honor.

The element represented by narrative and episode is slight. Powell was born at the beginning of 1850 in Woburn Place, Bloomsbury, under the shadow of the British Museum. His father, a provision merchant, came from South Wales. His mother, an Englishwoman, was the daughter of Dr. James York, who, besides being a skilful physician, was a good Spanish scholar. Powell got his preparatory schooling at Hastings, whence he went for two years to Rugby. At Oxford he was a student of Christ Church, doing nothing spectacular as an undergraduate, but taking his degree with a first class in history and law. Two years afterwards Liddell appointed him to a law lectureship at Christ Church. Having thus gained a definite appointment, Powell proceeded at once to make a love match, choosing for his wife a young widow with two daughters. "He always spoke of this," says Mr. Elton, "as the most fortunate event in his life, and was glad he had gone on his way despite the apparent imprudence." After this, apart from the record of studies and friendships, there is little to tell. During the fourteen years of their married life (1874-88) Powell and his wife had their home on the outskirts of London, the distance from Oxford not proving an obstacle to the performance of college duties. Even after his wife died Powell continued to make his headquarters in London; through this whole period, of course, he had rooms at Christ Church, but he did not transfer his permanent residence to Oxford until 1902, two years before his death. Such, in outline, is the chronology of Powell's career, and apart from matters relating to study or friends or holiday travels, one nearly exhausts the incidents even in this brief survey. It results that Mr. Elton was bound to make his memoir a record of intellectual tastes, and an appreciation of personal traits rather than a narrative of experiences. What York Powell was will forever find its best expression in his letters, and in the glimpses of his character which are here given by his friends.

At the outset we warn the reader that he must be prepared for surprises and paradoxes. For example, every one has heard of Christ Church as the most aristocratic, wealthy, and orthodox college in Oxford. From the fact that Powell for thirty years was connected with this seat of learning one might guess him to have been highly born and a stalwart Anglican. But neither guess would be correct. His family was eminently respectable, but not aristocratic; and as for religion, he styles himself "a decent heathen Aryan." Yet at Christ Church he found himself quite at home, for he had that truest tact which springs from a sense of tolerance and fairness, while his undisguised radicalism did not prevent him from being on excellent terms with the clergy. Mr. Elton says that probably he never once entered the Cathedral at Oxford while a service was in progress, yet Dr. Paget, the present bishop of Oxford, writes:

> It was a true, deep, bountiful heart that his friends knew in him. And the other day when I was trying to see of which graces it might be said that Christianity had either brought them into the world or touched them with fresh light and life, I thought of gentleness as one such grace; and immediately found myself thinking of York Powell.

But here again we must utter a warning, for Powell, though endowed with much true gentleness, was by no means a quiet, saintly, meditative skeptic. There was an abundance of brightness about him. He admired and loved Walt Whitman, he thought the proper function of woman was childbearing. Powell loved art, set a comparatively slight value upon human life, and had absorbed from his study of the sagas much of their spirit. His temperament to a certain extent is reflected in his prejudices. He disliked Americans, Jews, and learned ladies. But here again his sense of discrimination broke into even the charmed circle of his pet antipathies. "American books," says Mr. Elton, "he reviewed with laborious equity," and he thought Lincoln's Gettysburg speech the best thing in oratory since Pericles. Likewise, despite his objection to learned ladies, he gave at Somerville College lectures which seem completely to have captured the inmates of that institution, though his discourses did not always arouse enthusiasm among Oxford undergraduates.

One could run to great length in illustrating the perplexing attributes of Powell's nature. He was at the outset a fervid democrat with leanings towards socialism, but he had little humanitarian feeling and could watch a bull fight without repugnance. He had a genuine humility, yet it did not prevent him from passing trenchant criticisms upon individuals, any more than his original love of democracy prevented him from becoming a defender of the Boer war and the President of the Oxford Tariff Reform League. Apropos of his growing Toryism in politics, Mr. Elton writes:

> Powell had never been an English Radical. He had always, so far as can be seen, detested and despised Bright and Mill. He only half-liked Gladstone, and could not forgive his desertion of Parnell and his alleged desertion of Gordon. He never liked nonconformists, humanitarians, or preachers of universal peace. Yet he could honor Mazzini and remained, or became once more, an Irish Home Ruler. The truth was that his assortment of opinions was his own; in politics he rode his own course across country, he did not seek a rigid or logical body of articles, he had profound emotions and intuitions, and was little concerned to reconcile them with one another.

These last words, we think, give us the real clue to Powell's character. He was a man of acute perceptions, omnivorous reading, and universal interests. With a mind open to influences from many quarters, he had certain fixed principles, like those which made him aspire to be "a decent heathen Aryan." He also had a few definite prejudices tenaciously held, like those against Americans, Jews, and learned ladies. For the rest, he troubled little about logic or consistency. It was enough to react to the enthusiasm of the moment. His mind never lost its snap through lassitude, and taking up very many subjects eagerly he saw things in high relief. Hence we meet in his correspondence with numerous contradictions on many subjects, identical or closely allied. Beneath all else, moreover, lay a deep kindliness of nature which made him a sure friend in need and led him to mitigate many a strong statement in favor of an individual.

The extent of Powell's erudition created at Oxford a legend of omniscience. Of his conversation Mr. Elton says: "Elizabethan verse, the methods of engraving or enamelling, the character of coming politicians, and the genius of music-hall artists; all

these might be discussed in half an hour." And the writer of the obituary notice in the *Morning Post* observes:

We have heard him establish a contrast between Walt Whitman and the patriarch Job, in the course of which he spoke of the metrical system of the Psalms and of "Piers Plowman" and made an excursus on the rhythmic scheme of the Song of Solomon. But to what end does one write of what he knew? He will live now only because he made others know.

In the annals of scholarship Powell will be longest remembered for his association with Gudband Vigfússon. Between them the pair created that interest in Icelandic lore which has meant so much to recent students of literature and language. Vigfússon had an unrivalled knowledge of the sagas and their history, but his knowledge of English was not perfect, and he required the stimulus which came to him from daily association with one who, like Powell, had an endless fund of enthusiasm and energy. Apart from the "Corpus Poeticum Boreale," Vigfússon and Powell brought out "Sturlunga Saga" and an "Icelandic Prose Reader." So far as grasp of the subject goes, the elder man was, of course, the more important of the contributors, but Powell, in the course of their labors, developed a talent for vigorous translation and contributed his full share of suggestions regarding the details of the work. His relations with Vigfússon were most delightful, and must have involved a good deal of tact on Powell's part, since the Icelander was both poor and proud. "The wise, good, kindly man is dead," wrote Powell when Vigfússon passed away in 1889, and no shadow seems to have marred a fellowship which lasted for more than twelve years with notable results.

In other fields than that of Scandinavian literature Powell proved himself an accomplished linguist. French, German, Italian, and Spanish he knew from the twelfth century downwards, and his unflagging interest in European literature won him many friends outside England. German sentimentalism he could not abide, and he seldom lost an opportunity to disparage the intellectual ideals of Germany. His warmest sympathies, so far as the Continent is concerned, seem to have gone out to France, where he was prepared to see excellence at all stages, from Paul Verlaine to the École des Chartes.

But despite his wide knowledge of language and literature, Powell was an historian by instinct and profession. His deep and comprehensive interest in all varieties of human experience fitted him to appreciate and understand many aspects of the past which remain unintelligible to those whose knowledge is not tempered by true catholicity of spirit. Mr. Elton fills up his second volume with the more important of Powell's articles and reviews. There can be no doubt that a man of his powers and knowledge deprived the world of important works by expending his energy on other things than monumental research. As Regius professor, Powell neither reorganized historical studies at Oxford nor gave popular lectures to large audiences. Indeed, his classes were very small. But those who came into close personal touch with him through the study of texts felt to the full his power and the richness of his mind. Oxford, which is fastidious, had no doubt about his quality and the heartiness with which it welcomed his appointment was a real tribute of affection, for Powell was the last man to thrust himself into the front benches.

Of Powell as a delegate of the Clarendon Press or as a member of Christ Church, we cannot now speak. It only remains possible for us to point out that this memoir portrays a scholar whom other scholars, whatever the field of their effort, will recognize as having been a rich, rare spirit. He was not, says Mr. Elton, "a mere jolly professor, learned, domestic, and humane. . . . There was a chemic difference between him and the admirable tribe of such men." Through the spontaneity of his nature, the extent and richness of his learning, the breadth of his outlook, and his genius for friendship, Powell won, and will keep, a high place among the Oxford men of his generation.

The Life of Walter Pater. By Thomas Wright. With 78 plates. 2 vols. New York: G. P. Putnam's Sons. $6.50 net.

Mr. Wright has been drawn by the perilous attraction of dissimilarity to write the lives of several men of sensitive or fastidious mind, whom in temperament he little resembles. In his biographies of Cowper, FitzGerald and Burton we have had a constantly increasing mass of irrelevant photographic detail unrelieved by any real perception of his subject's quality, and now, despite the remonstrances of the closest surviving relatives and friends, he has "taken" the life of Walter Pater. His Preface of a dozen pages affords a pretty adequate taste of Mr. Wright's quality. After paying his respects to the previous biographers of Pater—Ferris Greenslet and A. C. Benson—in paragraphs which have already been sufficiently exploited by the publishers, Mr. Wright passes to the expression of his advantage over "superficial or less privileged writers." He is qualified, he believes, for his "self-imposed task," by being "sealed of the tribe of Dante" in his perception of the relevance of detail. The book, he thinks, "will seem practically an additional 'Marius' or 'Renaissance,'" and he asserts, "It is the kind of work, too (if I may without egotism say so), in which Pater himself would have gloried." Very few, indeed, of Mr. Wright's prefatory promises are made good. Despite his assertion that Pater wrote "an enormous number of letters—as many as four hundred. indeed, to a single friend," he prints not one; the formidable list of Paters that he gives as the source of his information are discovered to be chiefly fourth cousins. It is, by the way, a fair answer to Mr. Wright's charge that Mr. Benson "does not once mention five of Pater's most intimate friends, Dombrain, McQueen, Richard C. Jackson, Richard Robinson, and M. B. Moorhouse," to note that Mr. Wright himself does not so much as mention the name of either Hester or Clara Pater, the sisters to whom "Marius" was dedicated, and with whom he lived for practically all of his days; and finally, as we shall see, it is apparent that J. R. McQueen and Richard C. Jackson, who are respectively the heroes of Mr. Wright's first and second volumes, were men thoroughly out of sympathy with some of Pater's most cherished ideas and could never have been the confidants of that shy and elusive nature.

It may be said categorically that with the exception of one or two points to be noted hereafter, Mr. Wright's two obese volumes bring to light no detail of real biographic significance not to be found in Mr. Benson's volume, and few not adduced in Mr. Greenslet's earlier and briefer study. There is repeated reference to Pater's "plainness," to his reprehensible practice of passing the morning in bed, and to his dislike of snakes; there is an entire chapter on his first attempt to adorn his countenance with a moustache, there are multitudinous anecdotes about persons otherwise unknown to fame who had the advantage of meeting Pater or Richard C. Jackson—but the reader could arise from the closest perusal of the two volumes with little sense of Pater's peculiar and charming idiosyncrasy. It is, in short the failure of the "Boswellian" method in biography when applied by a man who is not a Boswell to a subject not a Johnson.

Mr. Wright's animadversions upon his predecessors in Paterian biography have piqued our curiosity to the extent of making some comparison of parallel passages. The result is rather surprising. A single instance chosen from many will perhaps illustrate sufficiently his method of dealing with the printed sources. In volume i., page 98, Mr. Wright says:

It has been ignorantly alleged by previous writers (and one has followed another like Carlyle's sheep jumping over an imaginary stick) that although Pater's earliest published essays are as mature in style as the author was mature in years, Pater made no attempt to write either as a schoolboy or as an undergraduate. But this is a colossal mistake, for not only was Pater one of the most prolific schoolboy authors who ever lived; but as an undergraduate, he wrote something or other—a poem, a translation, a portion of an essay—almost every day.

In Greenslet's "Pater" (New York, 1903) we find at page 19:

Though none of his undergraduate productions has been preserved, we hear of copious verse translation from Goethe, from Alfred de Musset, and from that fragrant *jardinière* for the perfuming of a young gentleman's style, the "Greek Anthology." A little later there was a time when for months he applied himself daily to the painstaking translation of a page from the prose of Sainte-Beuve or Flaubert, eminent humanists, patient artists with the file, and favored lovers of the proper word. The effect of such labor as this in forming his finished style is incalculable.

In Benson's "Pater" (London, 1906) we read on page 210:

At one time he applied himself daily for some months to translating a page of Sainte-Beuve or Flaubert, and this seems to have been his only exercise.

Mr. Wright has, indeed, swept together some odds and ends of negligible experimentation in both verse and prose, but the impression conveyed concerning them in both his preface and his text savors, as above, a little of disingenuousness.

Of Messrs McQueen and Richard C. Jackson, Mr. Wright's chief sources of fresh information, little need be said. Mr. McQueen was a school friend of Pater, but, as we learn from Mr. Wright's account, "renounced" him in 1860, owing to his "apostacy" from Christianity, and performed the friendly office of addressing a letter to the Bishop of London protesting against Pater's

being allowed to take Holy Orders. Mr. McQueen, as Mr. Wright says, has shunned the city's din, and delighted "in remote and sequestered villages and the company of husbandmen and sailors," which would not seem to be the perfect preparation for a sympathetic judgment of so complicated a product of civilization as Walter Pater. Richard C. Jackson, the hero of the second volume of Mr. Wright's work, appears to be a "poet" and "connoisseur." His qualifications for presenting a faithful view of Pater will perhaps be sufficiently evident from this stanza of a poem which Mr. Wright quotes and says was written to Pater in response to a request for a birthday song:

Your darling soul I say is inflamed with love for me;
Your very eyes do move I cry with sympathy:
Your darling feet and hands are blessings ruled by love,
As forth was sent from out the Ark a turtle dove!

The nature and degree of Mr. Jackson's intimacy with Pater is evident from an observation of Mr. Wright's in volume ii, page 91:

Thus it happened that at the very time several other men were turning over heaven and earth in order to get on familiar terms with Pater, Mr. Jackson, on account of pressure of business, was trying by every conceivable means—short of giving offence—to keep Pater at a distance.

Mr. Wright's contention that Richard C. Jackson is the original of "Marius the Epicurean" cannot be taken very seriously by lovers of that marvellous book. Indeed, as we read Mr. Wright's elaborate and minute report of the amenities that passed between Walter Pater and Richard C. Jackson concerning this matter, it is difficult to avoid the conviction that Pater was in his quiet way chaffing him.

Perhaps the most disastrous result of Mr. Wright's dealings with Mr. McQueen and Mr. Jackson is the tone of deprecation and patronage toward Pater that he has drawn from them. If ever there was a biographic subject needing the most delicate sympathy and tact, Pater was that subject. To see him treated as Mr. Wright has treated him through two volumes is peculiarly trying to the nerves. It is not that we do not welcome truth in biography, but that this amassing of irrelevant facts results in producing the effect of a monstrous untruth. The general unfriendliness of Mr. Wright's attitude toward Pater, despite his asseveration that he has for him a sympathy that amounts almost to love, may be seen in this passage concerning his personal appearance, a subject which is mentioned on innumerable occasions throughout the work:

In early portraits of him, taken just after the cultivation of the historical mustache, he has a rather helpless look, nor was he even then at all a strong man. In the portrait taken late in his life by Messrs. Elliott and Frye, he appears, though little over fifty, as bald as a coot, while the mustache has grown heavy and truly Bismarckian. The chin is shaven. He wears a spotted necktie. In these portraits he does not seem so very plain, but the evidence of all who knew him is the other way about; moreover, he himself was well aware of his shortcomings in this respect, and regretted them. He loved pictures; but there was one picture which always gave him pain—the one which he could see any day in the looking-glass.

And yet there is plenty of evidence that despite Pater's heaviness of body there was a certain pleasing delicacy and charm in his appearance for those who came to know him well.

About the only new fact of any significance in Pater's life which Mr. Wright has adduced, as the result of his foregathering with Richard C. Jackson, is that of his relation to the so-called "Monkery" of St. Austin's, a group of rich men of high church proclivities who in the later seventies fancied themselves hotfoot on the road to Rome. But the importance of this relation Mr. Wright, it seems to us, very much exaggerates. Pater was never an actual inmate of the establishment, and certainly never went all the way with its tenets. His speculative interest in its proceeding was quite what might be expected of a man who from his first youth had felt himself æsthetically drawn toward "the comely order of the sanctuary, the secrets of its white linen and holy vessels and fonts of pure water." In short, it is a question whether in biography irrelevancy may not be as great a sin as inaccuracy, if, indeed, it be not in itself a most insidious form of inaccuracy.

Of Mr. Wright's critical expressions, there is little need to speak here. Three of his dicta concerning Pater's general achievement and place in English literature will perhaps serve to indicate his critical insight:

No man cares a pepper-corn for his studies of French churches.

He is the grasshopper of English literature. "Thou sippest a little dew," we may say to him, and "Straight thou makest the woods and hills Echo all with thy dulcet trills."

He is the Alma Tadema of English literature.

This notice should not be concluded without some mention of the seventy-eight half-tone plates which Mr. Wright observes in his preface "are of intense interest." Of these, something over a dozen present Pater or places and objects connected with him, twoscore are the counterfeit presentments of the persons unknown to fame to whom allusion has been made above. Twenty-four have to do with Richard C. Jackson, including views of the northeast corner of his drawing-room at Camberwell; of a corner in the gold room at Camberwell; of the northwest corner of the drawing-room at Camberwell; of the southwest corner of the drawing-room at Camberwell; and of his dog "Tiny"; also twelve photographs of title-pages and illustrations to rare books in the library of Richard C. Jackson.

CURRENT FICTION.

Madame de Treymes. By Edith Wharton. New York: Charles Scribner's Sons.

Mrs. Wharton's extraordinary mental adroitness and nicety of touch tempt one to think of her as a kind of delicate mechanism which may be counted upon to record with automatic minuteness certain lesser vibrations of the social ether. There is something a little inhuman in this infallible suavity and precision, these infinitesimal modulations within the prescribed and civil range. But this is as it should be with the chronicler of the sophisticated and the well-bred. "Society" would be inhuman if it were perfect, if it were what it tries to be or tries to pretend to be; at the top of its breeding it actually achieves the appearance of inhumanity. But there is, we are told, a comfortable understanding that the appearance is sufficient. "Society," if we are to credit its chroniclers, gives with one hand while taking with the other, its morals being hardly less confessedly aboriginal than its manners are admittedly the very button on the cap of civilization. This compensatory *modus operandi* is observed with eager, if hardly magnanimous, interest by the dweller without the gates. What attraction has the Best Society to offer its public so moving as the spectacle of well-mannered misconduct in the sexual relation? What has it to offer a novelist or a dramatist so taking as the lure of its discreet variations upon the everlasting theme *à trois?* Mrs. Wharton is notably successful in rendering these variations, always with her negligent air of scorning the virtuosity with which nature and hard labor have equipped her.

Unfortunately, it is her fate to interpret episodes and persons in the light of circumstance, instead of employing them to "individualize the universal." It was not hard to understand the failure of "The House of Mirth" as a play. Divested of the accessories with which the novelist's art had surrounded her, Lily Bart was seen to be an insignificant person, suggestive of a large class of insignificant persons, but quite failing to sum them up, to give them significance. It is hard to guess whether this would be true of the figure of Madame de Treymes. This much the reviewer must confess for himself: he began by questioning whether she was a credible Frenchwoman and ended by deciding that she is certainly a credible woman.

She is, according to Mrs. Wharton, the perfect flower of the French tradition. She is surrounded by "an impalpable aura of grace"; her dress, like her manner, is distinguished by "quiet felicity." She is known to be involved in an intrigue with a nobleman, to pay whose gambling debts she has appropriated her brother's as well as her husband's money. Her brother, the disreputable marquis of tradition, has married an American girl, who now wishes to be freed from him so that she may marry an American. Madame de Treymes is asked to use her influence to gain the family consent to a divorce. She agrees on condition that the American make up the sum she has squandered on her lover. At this his sense of decency revolts, and he refuses. Presently she announces the consent of the family, professing shame for her proposal, and accepting the gratitude of the waiting pair. Eventually, after the granting of the divorce, it transpires that the family have from the first intended to consent to it. In outline, you say, it is a sufficiently sordid story, Madame de Treymes bearing a striking resemblance to the stage-worn adventuress of melodrama. Yet in Mrs. Wharton's portrait she is undeniably appealing. She is presented as a sacrifice upon the altar of French society and family convention. Her marriage is prescribed by family, her infidelity is practically sanctioned by her family, her duplicity in the present instance is dedicated to the welfare of the family. "She was simply one particular facet in the solid, glittering, impenetrable body which he had thought to turn in his hands and

look through like a crystal." "You poor, good woman," says the man as he leaves her. That the phrase does not seem impossible is a sufficient indication of the skill with which Mrs. Wharton has painted her latest portrait of feminine haplessness.

Tiberius Smith. By Hugh Pendexter. New York: Harper & Brothers.

Tiberius is a showman and travelling collector of curiosities for his show. The word "is" is used advisedly, for although when his sixteenth adventure and the book end together he has been abandoned as dead in a Pacific island, there is a reasonable hope that he is not dead, but riding about the island in a mowing machine, lording it over the subjugated natives as a new chief in a man-devouring chariot. His friend and biographer, Billy Camphell, thinks so at least, and means to go some day to the rescue and bring him back. It is only natural that the public should be kept waiting a little for the compilation of exploits that shall be worthy to succeed those of the present volume. Not every day can even a Tiberius Smith play poker with Arctic giants for his own freedom; drive an automobile around the inner rim of a South American crater, quell four lions and two white leopards in a gladiator's ring with ammonia pistols, preside over a Vermont court in a will case, where the testamentary provisions were hranded on cows' sides; or frighten away an attacking band of Indian tribes by feeding dynamite to their dogs. For the lover of the circus in literature here are thoughts that hreatbe; for the collector of the ultra modern and vaudevillainous in slang, words that burn; remain, for the lover of a book in the accepted sense of that word, feelings not fit for publication.

The Long Road. By John Oxenham. New York: The Macmillan Co.

Here is a story of Russia based upon the decree of a tyrant Governor of Irkutsk that a certain resistant to his cruel whims should for punishment wander forever within prescribed provinces of Siberia, staying never more than ten days in any one place. And so it was. The wanderings of Stepan Iline and his household, and all his sufferings, together with his death and his passing into legendary immortality, are told with dire impressiveness by Mr. Oxenham. He makes a note: "The extraordinary decree on which this story was founded is not an effort of the imagination, but simple, historical fact." If not founded on truth, the tale would be unprofitably painful. As it is, the theme may well have been irresistihle to the novelist and to the humanitarian. If there are any gleams of hope in Russian skies, Mr. Oxenham makes the most of them. True, he shows how unoffending men may be driven into exile with their families for taking snuff, but equally he points out idyllic happenings by the way, and, even more significantly, the not all dreadful life of Siberia under the ordinary Governor. But Paschkin was of Satan and his ingenuities were diabolic.

The author is artist enough as well as chronicler enough to utilize his chances for contrast. The small home on wheels is, while it lasts, a happy place with the steadfast wife and the merry pair of babies. The child figure of the little Katenka is as real as the tyrant himself and as charming as the blue flowers that she loved to gather. The horses, the tame wolf-cubs, the owl—"little white brother of the woods"—are humanly alive. All these touches, added to the secret service of kindness among the fellow-sufferers from tyranny, do somewhat to relieve the awfulness of the story. The climax, where Stepan renounces the revenge he has lived for, is no less true to nature than dramatic; the choice of the agency that brings about the renunciation a master touch. The tragedy spent and the sacrifice made, the story ebbs through misery as dark as the enfolding Arctic night into its sombre, not all uncomforted end, as quiet as tbe despairing close of a Greek play of Fate.

Peter Moors Fahrt nacht Südwest: Ein Feldzugsbericht von Gustav Frenssen. New York: G. E. Stechert & Co.

In "Peter Moors Fahrt nach Südwest," Gustav Frenssen has hurled the most effective shaft yet directed against the unfortunate campaigns of the Germans in their West African colony. The volume, which narrates in his own simple language the awful experience of a common soldier from North Germany, who volunteered for service, is dedicated to "Der deutschen Jugend, die in Südwestafrika gefallen ist"; it comes with much suggestiveness at the moment when the Government has just published the sum-totals of its dead and wounded. While the tale is, of course, more or less fiction, it is fair to assume that one so conservative as the author of "Die drei Getreuen" had access to many documents, such as letters from soldiers to their homes. Throughout the book the sombre seriousness of Frenssen, so often noted in his "Jörn Uhl" and other works, is manifest; and just as he once brooded over Holstein's melancholy landscape, he now finds unending austerity in the rolling wastes of Africa. Landed on a barren coast with no one to greet them, stuffed like sardines into rickety railway cars that cannot be drawn by steam over the heavy grades unless the soldiers get out and push, baked in the African sun by day and frozen at night, wandering, prospecting, fighting while in search of the main column they are supposed to join, ambushed by natives who are armed with weapons seized from the German dead, hungering and thirsting in a land where there is no water, becoming so delirious from wounds and lack of medical care that the sick fall from hospital wagons into the hush unnoticed by guards, praying rather for death than life—these are some of the *rührende* contents of the tale.

There is no war, as the German understands it; but there is fighting and skirmish and massacre and murder, and in all these scenes, especially amid the whistling of lead in the bush, the author of "Gravelotte" shows his clear head and trained hand. Indeed, had he made the campaign himself he could hardly have treated his experiences witb more realism. What is remarkable is that nowhere is there a suggestion of the overbearing or cruel German officer; the commander wears old uniforms, shares with the lowliest all the terrible privations and even death itself. On the other hand, in conversatlons of officers, which Moor overhears, Frenssen makes clear his own doubts as to the wisdom of Germany's course. One time the campfire group point out the folly of preaching brotherhood and love to the natives one hour and shooting them down like dogs the next; again they impatiently declare their doubts as to the German's natural aptitude for settling and managing such a country, and ask: "Why doesn't Germany sell the colony to the English and pull out of this God-forsaken land?"

Princesses and Court Ladies. By Arvède Barine. Authorized English Version. New York: G. P. Putnam's Sons. $3 net.

Some Beauties of the Seventeenth Century. By Allan Fea. New York: Brentano's. $4 net.

At first sight both these volumes might seem to be "beauty" books of the common variety, but on closer inspection it becomes apparent that there is a considerable difference hetween them. Mr. Fea gives us heauties with great profusion, no less than thirty-two altogether, but most of them helong to Whitehall in the days of the Restoration. When he goes outside the precincts of Charles II.'s court, it is simply to hring in La Vallière, Mme. de Montespan, Mdlle. de Fontanges, and other sultanas who flourished at the same period on the east side of the Channel. Mme. Barine, in a volume which is rather longer than Mr. Fea's, limits herself to five personages, three of them drawn from the seventeenth century, one from tbe eighteenth, and one from the nineteenth. With the single exception afforded by Marie Mancini, none of these ladies can he styled a court beauty. Mme. Barine seeks her criterion rather in experiences or in character than in good looks.

The chief contrast, however, which we would institute between these two hooks relates to the method of approach. Mr. Fea does little more than collect gossip and discuss, at times, the portraits of the Restoration Court. Mme. Barine, on the other hand, allows herself space to indulge in the luxury of critlcism. Each of ber subjects is selected as a type, and the range of psychology thus traversed is highly representative. Besides Marie Mancini, already mentioned, the ladies of her choice are Christina of Sweden, the Duchess of Maine, the Margravine of Bayreuth, and that Princess Salme of Zanzibar who married a Hamburg merchant and became Frau Emilie Ruete. Each of the five essays is filled with discriminating touches, and in one case, at least, Mme. Barine sketcbes a remarkable character with much firmness and insight. We refer here to the study in which Christina of Sweden is followed throughout the whole course of her career hy one who does not suffer admiration for her talents to obscure the reprobation of her moral callousness. One rather important omission Mme. Barine seems to have made in consulting authorities for the life of Christina, inasmuch as she has not used the correspondence between Cardinal Azzolino and the Queen, which was published in 1899 by the Baron de Bildt. She is quite familiar, however, with Arckenholtz and with Granert, who have

supplied the essential data regarding this surprising woman, in summing up her judgment, Mme. Barine says:

Neither the talents of Christina nor her superior intelligence, nor her courage, can save her from an implacable judgment. She was beyond the bounds of all honest and responsible humanity. This crooked body contained a crooked soul, which knew neither right nor wrong. This brilliant Christina, almost a genius, was, morally, a veritable monster.

Oddly enough, Mme. Barine and Mr. Fea share the two most famous of the Mancini, the former taking Marie, and the latter, Hortense. The adventures of these two pleasure-loving sisters have been told so often that for the reader of memoirs there can be little excitement in any ordinary account of the plight to which their vagaries brought them, but Mme. Barine has one generalization that may be of some interest:

The Mazarin blood, mixed with that of so many illustrious families, brought ill luck with it to all. The houses of the Este, of the Stuarts, of the Vendômes, of the Contis, of the Bouillons, of the Soissons, died out, one after the other. And the treasures amassed by Mazarin, his millions, his old masters, his antique statues? The Duke of Mazarin, his heir, mutilated the statues with a hammer, smeared over the pictures, spent millions in law suits before all the courts of France; so that according to M. Amédée Renée's witty remark, "It was the Fronde that, after all, was Cardinal Mazarin's real heir."

We may have seemed to disparage the work of Mr. Fea by calling it a collection of gossip, but much depends on whether or not gossip is collected by one who knows his period. Mr. Fea, in many previous books on the times of Charles II., has shown his command of Stuart literature. The same first-hand knowledge which was disclosed by "The Flight of the King" and "King Monmouth" is amply illustrated in the present volume.

The First Forty Years of Washington Society. Letters of Mrs. Samuel Harrison Smith. Edited by Gaillard Hunt. New York: Charles Scribner's Sons. $2.50 net.

If anywhere in the world there was a more cultivated society than that which distinguished our national capital during the first forty years of the last century, the writer of these letters did not even dream of it. She believed profoundly in Washington's charm. In one of the letters she confesses a deep sensibility to pleasure and a dread of monotony and quiet. Since she was pronouncedly social, these foes were never permitted a triumph. Even when she was alone her pen was constantly busy. At the capture of Washington by the British in 1815 she found refuge in a wayside country home, and promptly took up her pen and wrote her husband a full account of her adventures. Mrs. Smith's letters cannot be said to throw much light on the greater events of our politics, but they are nevertheless an engaging contribution to history in the form of a lively picture of social life at Washington. Possessing no special charm in themselves, they will be often resorted to for color by other writers.

She went to Washington in 1800, a bride. Her husband had just founded the *National Intelligencer* as the organ of the Republican party, and his ability gained him instant admission to the notable group of men who recognized Jefferson as their leader. Later his connection with the Treasury, and yet later with the Bank of the United States, served to maintain his friendships and keep him in touch with affairs. His wife had, besides her own personal friends, men and women prominent in Washington. The capital she describes has long since vanished. Its society in these early years was necessarily made up of persons in office, and these as necessarily lived in boarding-houses. In much that appears in these pages there is a sort of picnic flavor, an air of abandon one might expect of the officials of a young nation busy setting up a government in a forest. The cholera and the ague stalking at intervals through the letters, the deepening political animosities, heighten rather than diminish this effect of sylvan simplicity as a wilderness is slowly changed into a city and a capital.

Such political importance as the letters possess consists in the intimacy they permit with Jefferson, Madison, Crawford, Clay, and Calhoun. The character and career of Jefferson in truth furnish Mrs. Smith a sort of keynote for all the political speculation she indulges in. Whenever her great chief appears, her words breathe reverence and loyalty; and the awe he excited when she first met him persisted so steadily that her portrait of him is less life-like than those of Madison, Crawford, and Clay. Of Crawford in particular, one of the dimmest figures in our history, we are given an illuminating view. Jackson's brief appearance serves to prove what a spell was cast on women by the manner of that backwoodsman. Here and there we get glimpses of Washington flocking to the Capitol, as it continues to do. Mrs. Smith tells of Sunday services in the House of Representatives, converted by the feminine world into a striking social function; of the great debates when the same feminine world crowded the floors of the Senate and the House. She represents Hayne's seat as being occupied by a woman listener, while the Senator was engaged in his historical contest with Webster. Not the least amusing touches of the volume are the description of the far-famed cartrumpet of Harriet Martineau, and in quite another field, the flight and pursuit of Washington ladies by Winnebago Indians.

The editorial work is competently done by Gaillard Hunt. His candor in preserving the simplified spelling of the writer, and certain even more simplified grammatical constructions, contributes to the impressions of essential veracity.

The Fourth Gospel: Its Purpose and Theology. By Ernest F. Scott. Imported by Charles Scribner's Sons, New York. $2 net.

British criticism of the Fourth Gospel has concerned itself chiefly with the questions of authorship and date. Both the external and internal evidence have repeatedly received scholarly examination. It has become evident, however, that decision on these matters could not be reached on the basis of quotations from Church fathers and allusions in the gospel to localities and customs in Palestine, but that the problems must wait for wider knowledge of the character of the writing, its purpose, aim, and place in the development of Christian life and thought. Mr. Scott has wisely confined himself to the latter questions. Assuming that the gospel was written in the early years of the second century, he seeks to discover its ultimate aim and object, the needs it was designed to meet, the difficulties and errors which it was calculated to correct. He treats the Fourth Gospel as one of the most important facts of Christian history; and he holds it more important to understand and interpret the work than to pronounce the name of the author and fix the year in which he wrote.

It would be extravagant to assert that the design of the Fourth Evangelist and the peculiarities of his method are made entirely clear in this essay, but it is not too much to say that no recent author has gripped more firmly the real problems of the most difficult book of the New Testament and thrown stronger light on the many perplexing questions that arise in its perusal. Why an orthodox writer at the beginning of the second century should have undertaken to compose a gospel, and how the rise of Gnosticism served as an incentive to its composition, are subjects which Mr. Scott elucidates with considerable success. The motives which led to the adoption of the Logos idea and the consequences of that momentous step are well set forth. The omission from the gospel of all mention of the foundation of the Eucharist is placed in proper historical light, and explanation is furnished also of the spiritualization of the doctrine of the *parousia* in the discourses at the last supper.

Mr. Scott finds in the Fourth Gospel an attempt to combine a vital religious experience, mediated through Hebraic forms of thought, with an alien philosophy. The evangelist's temper was conservative, and his motive was to preserve the faith in which he had found new life. It was perhaps inevitable in a time when criticism was winning its spurs that John's departures from the older tradition, his aberrations in historical presentation, should be chiefly in the fore. That period, however, is passing, and even defenders of the authenticity admit that the Fourth Gospel is to be used with great caution as a biographical source. Now that agreement has been reached on this matter, the way is open for sympathetic appreciation of the religious teaching of John, and for fairer appraisal of his religious genius, which could produce in the form of biography such a remarkable treatise on the religious affections. It is the merit of Mr. Scott both to have made clear the profitable line of study in connection with the Gospel of John, and also to have exhibited some valuable results of endeavor of this sort.

A Dictionary of Christ and the Gospels. Edited by James Hastings, with the assistance of John A. Selbie, and (in the reading of the proofs) of John C. Lambert. Volume I. Aaron—Knowledge. New York: Charles Scribner's Sons. $6.00.

This work is intimately related to the "Dictionary of the Bible," by the same editors, which was published in four vol-

umes from 1898 to 1902, with a supplementary volume in 1904; indeed, the two might be regarded as one series. The purpose of the new undertaking is to give more attention to everything that relates to Christ, and also to treat all topics connected in any way with the study of the gospels with special reference to the needs of clergymen, to produce "first of all, a preacher's dictionary." The editors explain that "the authors of the articles have been carefully chosen from among those scholars who are, or have been, themselves preachers." In the long list of contributors, however, are not a few who now hold academic positions in Great Britain and America. Scottish names predominate, and Continental scholars are accorded but a single representative.

Were this work put forward as a minister's commonplace-book, a mere repository of unsifted homiletical material, certain defects might pass without notice, but since it purports to be the product of scholars, and will be regarded by many as representing the present opinions of critical students, a few sentences of criticism are demanded. The work contains, in the first place, an intolerable amount of extraneous and irrelevant matter. The titles could have been diminished at least one-third to the improvement of the book as a work of reference. A few of the superfluous titles are Abgar, Abiding, Above and Below, Amazement, Ambition, Aristeas, etc. To load a reference work with matter of this sort seems to us an error of judgment.

A far more serious defect is the choice of writers of a decidedly reactionary point of view for articles on important subjects. Without doubt, an encyclopædia should be conservative, *i. e.*, it should not yield place to conjecture, to radical departures from accepted views which have not been subjected to the test of criticism. But conservative in the sense of holding to opinions and positions which are either fast yielding ground or have already lost the field, a work of reference certainly should not be; and we confess to disappointment in discovering this latter kind of conservatism. On nearly every page the desire to minimize differences between documents and passages may be noted, together with a painful effort to harmonize and gloss over discrepancies. In some cases, the facts brought to light by historical criticism are stated, yet the irreconcilable traditional interpretation is allowed to stand, as when we read that a superstitious belief in evil-disposed demons "stretches, from the earliest times to the present day, like a great chain along the course of human history"; and, in the next column, that "the demonology of the Gospels offers something *sui generis;* one becomes conscious of the fact that this link in the long chain is very different from all the other links." Even W. R. Inge, one of the more progressive contributors, declares that the discourse on the bread of life "does not refer directly to the Eucharist," yet almost in the same breath he says that "the Evangelist undoubtedly wishes, by narrating it, to spiritualize and generalize the whole Eucharistic doctrine." Now and then a clear historical verdict is spoken, as in a few brief articles by Prof. Shailer Mathews and E. F. Scott, and in P. M. Barnard's discussion of the "Genealogies"; but for the most part the authors appear to have been constrained by the opinion expressed by Dr. C. W. Hodge of Princeton in his article on "Fact and Theory": "If we are not to lose Christianity, we must abide by the Scripture as an external authority."

In his brief treatment of the Acts of the Apostles, Prof. J. Weiss of Marburg sets forth with marvellous lucidity and penetration the Christology of the Acts, and the same author has an enlightening article on the "Ethics of Jesus," but such cases are hard to find. They show, however, what this "Dictionary" might have been had its editors found the wisdom and courage to turn to historical students rather than to dogmatists and apologists, for light on historical questions. That such a compilation should be denoted "first of all, a preacher's dictionary" is not at all complimentary to clergymen. For we do not believe that many clergymen desire encyclopædic assistance to preach that angels "form firstly an army or host," "secondly a court," "thirdly a choir," and also that they are "free from sensuous feelings" and have "extensive, yet limited, knowledge."

The History of the Papacy in the Nineteenth Century. By Dr. Frederik Nielsen; translated under the direction of Arthur James Mason. 2 volumes, pp. xiii., 378, 481. New York: E. P. Dutton & Co. $7.50 net.

The two large volumes, which, under the above title, make an interesting contribution to a much-discussed question, are timely in the best sense of the word. The present keen interest in the French religious controversy cannot be satisfied without some knowledge of the way the Revolution treated the Church and of the character of the parties to the Concordat. The editor's preface reflects the spirit that animated the translators and explains the unevenness of style, which, however, is not too apparent. The work has a title that is not quite descriptive of its contents; but the author's preface informs us that this is unavoidable until the completion of another volume dealing with the history of Leo XIII., thus making the work really a survey of the Papacy in the nineteenth century.

Nearly half of the first volume is given over to the relation of Jansenism and Gallicanism, the Encyclopædists and Jesuitism; the abolition of the Order of the Jesuits by Clement XIV. under the political pressure of the Bourbon family treaty, the founding of the Redemptorists, and the work of Joseph II. in reforming the condition of the monasteries. This is really prefatory to consideration of the great change in the fortunes of the Papacy inaugurated by the French Revolution, from which point the work enters upon the period so disastrous to the Church. The dissipation of the vast wealth of the French Church by the abolition of the tithes, the seizure and sale of the Church lands, the reductions in the number of the clergy, the suppression of the Monastic Orders, called forth little resistance, so tepid was the Catholic feeling of the time; but when the National Assembly attempted to remodel the Church, then the conflict between the Revolutionists and the See of Rome was precipitated.

Bishop Nielsen clearly points out that although the Assembly had adopted the principle of freedom of conscience and the principle of a State Church, it forgot, in regulating the affairs of the Church, what was due to the scruples of the faithful, and returned unwittingly but surely to despotic precedents and the old contempt for human liberty. There is no better statement of the steps leading up to the famous convention defining the nature of the faith than is to be found in Bishop Nielsen's account of the Concordat. The problems of the Restoration, the troubled Pontificate of Pius IX., the Vatican Council, and the *Kulturkampf* are so dealt with as to give us a sane and restrained view of the passing of the oldest element of Mediævalism. The work accomplishes all that the editor claims for it, and recalls the contributions of Stubbs and Creighton. May we soon see the third volume dealing with the Pontificate of Leo XIII. and exhibiting the same characteristics of thoroughness of investigation and independent judgment.

No Man's Land: A History of Spitsbergen from its Discovery in 1596 to the beginning of the Scientific Exploration of the Country. By Sir Martin Conway. New York: G. P. Putnam's Sons.

In the long range of books dealing with the history of exploration and discovery there are few that afford more pleasing reading than this by Sir Martin Conway. Its scope and thoroughness may be gauged from the fact that it covers the better part of four hundred pages, devoted to a region which to the average mind appears little more than a bleak and ice-bound spot lying toward the eightieth parallel of north latitude. But there are periods in the history of Spitsbergen (we follow Mr. Conway's spelling of the word: from *spits*, a point, having reference to the pointed mountains) which show that at times the island was more than it generally appears to us, and that it played no unimportant rôle in minor history. The "No Man's Land," whence the ill-fated Andrée expedition started to reach the North Pole, and where the second balloon expedition, that of Mr. Wellman, has but recently established its base, a land whose furthest point is only 930 miles from the Pole, and whose ice-bound shores and vast interior ice fields have saved it from the grasp of nations—this country has had its place in the industrial development of the world. We are told in Mr. Conway's work, and in other narratives, that less than three centuries ago, or more precisely, in the period between 1623 and 1644, when there had been an unusual development in the whale-oil industry, in which the Danes, the Dutch, and the English had rival interests, certain features of European life were transplanted to this far-off region. The sea front at Smeerenburg was lined with warehouses, furnaces, and cooling troughs, there were *maisons de pierre, beaucoup de loges ou cabannes, et pour defense un fort, muni d'artillerie,* and even a church. Whether or not this unique settlement, which Zorgdrager believes well deserved its local appellation, "Blubbertown," had at the time of its greatest prosperity a summer population of 10,000 or even 20,000, as some historians hold, or only

1,000 to 1,200, as the author of the book before us thinks more likely, it furnishes an interesting subject for the geographer. A few ruins, the battered remains of a long line of capstans, and scraps of rusted iron are all that to-day tell of a prosperous industry that was carried on at a point further north than the point at which Kane abandoned the Advance, or Cape Sabine, where the tragedy of the Greely expedition was enacted.

Sir Martin Conway's work is a model of painstaking research. The main text is supplemented by a list of principal voyages to Spitsbergen recorded from 1847 to 1900 (with useful explanatory notes), a bibliography of history and geography, a dissertation on Spitsbergen cartography, a chronological list of maps, and a history of Spitsbergen nomenclature before the nineteenth century. The numerous illustrations, many of them borrowed from the earlier texts and carefully reproduced, contribute not a little to the general attractiveness of the volume.

The Children of the Nation: How Their Health and Vigor Should be Promoted by the State. By Sir John E. Gorst. New York: E. P. Dutton & Co. Pp. x., 297. $2.50.

Not as an outsider does Sir John E. Gorst approach the problems which he handles so fearlessly in "The Children of the Nation." From 1895 to 1902, he was Vice-President of the Committee of Council for Education—the position which, before the reconstruction of the Education Department, corresponded to the present President of the Board of Education. His experience of the difficulties which hamper an English Minister of Education, who had to administer laws which put the interests of the Church of England and the National Society before the interests of the children for whom the schools ought to exist, probably turned his attention to the subjects of the present volume. Sir John E. Gorst is now seventy-two; since his retirement from the Education Department in 1902, he has been out of the hurly burly of politics. He can look back on a long and successful life, and his bitter attack on the "Governing Classes of England" cannot be regarded as the clamor of a disappointed politician or the envious utterances of one of the have-nots. It can only be the "taint of philanthropy," of which one of his Conservative colleagues accused him at the time he was Under Secretary of India, that leads him to condemn alike Conservatives and Liberals for their want of care for the children of the nation.

The bogey of Socialism cannot frighten Sir John Gorst—at any rate not when children are the objects of what some might term Socialistic treatment. It is not Socialism, he insists, to assert that children have a legal right to be maintained by others, until they are of age to maintain themselves. Under maintenance he includes food, clothes, lodging, and care in sickness. If the parents do not provide these, it is the duty of the state to step in and either compel the parents to fulfil their duty, or if this is impracticable, to take the duty upon itself. "This is not Socialism," he repeats, "it is a description of the law of the land." That a single child can go about under the eyes of public officials underfed, or insufficiently clothed, is a proof of inefficiency or malfeasance on the part of the authorities. Sir John Gorst makes out a similar case for free medical attendance in illness. It is one of the rights of every child to grow up fit and healthy, and it is economy for the nation to guard against the child developing into a burden and a liability instead of an asset.

The years spent by Sir John Gorst at the Education Department evidently convinced him of the value of women's work in all matters concerning care and education of children. He writes:

> The infant schools should be inspected exclusively by women. The Board of Education some years ago tried the experiment of appointing half-a-dozen women inspectors; but they brought to light so many defects or abuses in the schools, which no office manipulation of their reports could conceal, that they have now been withdrawn, and the infant schools are again inspected regularly by men, mostly ignorant of the wants of little children. They should be under the supervision of a Women's Department of the Board of Education, so as to secure that woman's knowledge will no longer be thwarted by man's ignorance.

Sir John Gorst had evidently finished his book before the passage of the act of last session, providing for the feeding of school children. With that legislation, so far as it goes, he must have been fully in sympathy, although he advocates a far more thorough system of feeding. "A child cannot be a pauper," he maintains against those who fear the pauperizing of the people through this Socialistic legislation, "for it is born with a right to be maintained by others till old enough to maintain itself, and the child of the rich is as dependent upon others as the child of the poor; parents may be paupers; but to call a child by the opprobrious name of pauper because its parents are such is as unjust as to call a child a criminal because its parents are in prison."

When it is remembered that Sir John is a lifelong Conservative; that he entered Parliament in 1866; that he sat in the House of Commons continuously from 1875 to 1902; and that during these twenty-seven years he held office in four Conservative Administrations, the Radical and Socialistic tone of his book is enough to cause a gasp of astonishment even in England, where Socialism has made so much greater progress than in the United States. "We are all Socialists now," was a well-remembered dictum of the late Sir W. Harcourt; and to this creed Sir John Gorst must have given hearty adherence.

Science.

Mars and Its Mystery. By Edward S. Morse. Boston: Little, Brown & Co. $2 net.

Mars and Its Canals. By Percival Lowell. New York: The Macmillan Co. $2.50 net.

In 1877 Schiaparelli commenced his well-known work on Mars by mapping more precisely than his predecessors the bluish-green regions. From their color, and the seeming probabilities of the case, these regions were formerly surmised to be oceans. Schiaparelli observed them to be connected by bands of the same color as themselves, narrow in proportion, yet several hundred miles in breadth. The terms "sea" and "ocean" having been applied to the larger regions, he named these narrow connecting bands *canali*. This Italian word designates connecting strips of water, whether artificial or natural, and, had he written in English, he would have said "channels." But the idea that the works of intelligent beings had been discovered on another planet was so captivating that Schiaparelli's word, taken in connection with the spelling, was translated "canal"; and the subject naturally excited a degree of attention which the original observations would not otherwise have commanded. The canals of Mars and the supposed purpose of the beings that constructed them, became objects of curiosity, both to astronomical observers and the public generally. In the next opposition of Mars, which occurred in 1879, Schiaparelli reached the conclusion that these channels were not the broad bands he had supposed them to be, but strips so narrow that they seemed like fine lines, thus taking a step toward the justification of the mistranslation. If not what we should call canals, they were more like such works than the broad strips of water shown by the observations of 1877.

The next important step forward in the delineation of the planet was taken by Percival Lowell, who founded an observatory at Flagstaff, Ariz., a point of high altitude, where the air is of exceptional purity. The special purpose of this establishment was the study of Mars, a work on which Mr. Lowell entered with the greatest energy and enthusiasm, both by observing himself, and by employing the eyes of well-trained assistants. The results of his work have appeared in three fine volumes of observations, as well as in several popular writings and courses of lectures.

The two attractive books before us may be regarded as the latest output of the Flagstaff observatory. That of Professor Morse, which came first in the order of time, was the outcome of a visit he paid to Flagstaff in the summer of 1905, during an opposition of Mars. At first blush it might seem rather venturesome for a naturalist so eminent as the director of the Peabody Museum at Salem to appear before the world as an astronomical observer. But the field that Professor Morse has here entered, though belonging to the heavens, is not an essentially astronomical one in the sense of involving subjects or methods of observation with which a naturalist is not familiar. The trained eye of a microscopist will naturally be well qualified to catch details made visible with a telescope, and the study of the surface features of another planet involves no recondite principles of astronomy. The author gives an interesting account of the difficulties which he at first encountered in detecting the canals, and his ultimate success in seeing several of them. The main purpose of his book is to discuss the general subject of the surface of Mars from a naturalist's point of view. He argues strongly that the so-called canals cannot possibly be regarded as purely natural. He adopts substantially the view of Lowell, that we here have to do with long and comparatively narrow strips

of vegetation over an otherwise arid world, a feature which is attributed to a comprehensive system of irrigation. One cannot but admire the ingenuity of his argument, even if unable to accept his conclusion.

In view of the readability and general merit of the book, the critic cannot but regret that Professor Morse has accompanied his arguments by comments which are too polemic in tone for scientific discussion, and which tend to prejudice the unbiassed reader against his conclusions. One chapter, which we must in justice say is not a long one, is devoted to "comments and criticism," in which those doubting astronomers who have questioned the reality of the canals are dealt with much as unbelievers once were in the Puritan pulpit. The most curious feature of these criticisms is that even the quotations which he lashes with such severity do not seem, to us at least, to justify the punishment. For example, he quotes the work of a committee of the British Association, which, in 1892, had twenty-six observers at work making drawings of the surface features of Mars. The director of the work, however, reported that notwithstanding the astronomically favorable character of the opposition, the result was, on the whole, disappointing, owing to unfavorable weather, while the pressure of other duties prevented his supplying detailed help. On the strength of this, the author "appeals to any honest and unprejudiced mind if a more incompetent person could have been found in England for the directorship of the work."

Mr. Lowell's book embodies such a wealth of observation and reasoning that it is not possible to do it justice within the space of the present review. How widely soever one may dissent from his conclusions, one must concede that among all the observers of the planet, he easily takes first place, both with respect to the favorable conditions under which he has worked, the energy and enthusiasm which he has displayed, and the care he has taken to avoid every source of error. The most adverse critic cannot but admire the tireless industry with which the planet has been scanned night after night, every noteworthy appearance regarded, and the mass of facts thus acquired moulded into a consistent whole. When we say that his conclusions do not always carry conviction, we still admit that there is vastly more truth than error in what he says. With any claim surely erroneous we can scarcely charge him. And yet, in all that relates to his more interesting conclusions—those which attribute the dark lines to vegetation produced by artificial processes—we cannot look for general assent on the part of critical astronomers. Perhaps this may be due, as Professor Morse maintains, to a certain professional narrowness in their habits of thought. Whether this be so or not, we shall venture to set forth the two weak points in Mr. Lowell's beautiful system.

Our first point will be readily understood by any one who will scan the planet Mars under the most favorable circumstances, with the best telescope within his reach, and notice the difficulties in the way of seeing any detail in so seemingly small, indefinite, and rather ill-defined a globe of light. Then he must conceive hundreds of lines marked all over this little globe and imagine the difficulty of making out their exact character. He must also reflect that the most careful training of the eye may result rather in the interpretation of what is dimly seen than in its exact specification. In a word, the foundation of Mr. Lowell's argument rests upon an extremely slender base of appearances, to be made out only with the greatest difficulty. The ancient maxim that "things are not always what they seem" may very well be taken to heart in forming our judgment. The other weak point is the great number of unknown possibilities as to the causes which may be acting upon another planet. Lowell's work records more than one observation of which it seems difficult to construct a really satisfactory explanation. An example is that of a bright cloud floating at a height above the planet vastly greater than any cloud is seen in our air. Of course, there is no inherent impossibility in this, but it shows that things may be going on in Mars which we cannot understand, and justifies the agnostic point of view in everything that concerns minute details and intricate processes of reasoning.

These possible weaknesses do not detract from the general merit of the work. There is no heavenly body, except the sun, in which so many complex and variable phenomena have been found as Mr. Lowell has found in Mars, and no work upon the physical constitution of a heavenly body has surpassed his in the quantity and ingenuity of its reasoning. If the general reader finds much that the thinking astronomer would fail to regard as integral parts of established scientific truth, he will still be entertained and instructed.

"Arctic Exploration," by J. Douglas Hoare (E. P. Dutton & Co.), like several other recent publications on the same subject, appeared virtually antiquated on the day of its issue; for the author was unable to take note of the latest of Mr. Peary's remarkable journeys, and therefore to give the "record" in Polar work. The book is a light compilation of old and new narratives, and gives evidence of preparation by one who has but a superficial knowledge of his topic. Neither in its estimate of researches nor in the analyses of the different journeys do the pages betray special fitness on the part of the author. Indeed, a casual glance at the concluding chapters reveals a carelessness which detracts from the usefulness of the book. Thus, on p. 299, Mr. Peary's "farthest north"—the record of the journey preceding that of 1905-1906—is given as 81° 17′ N. (instead of 84° 17′) and there is no reference whatever to the delimitation of the land-masses on the North or to the discovery of the farthest projecting point, Cape Morris Jesup. On p. 306 the reader is informed that in recent years, "with the exception of Capt. Cagni (!) and his party who perished during the Duke of the Abruzzi's expedition, only four men, Baron Toll, F. G. Seeberg, and their two hunters, have lost their lives in the cause of science in the Arctic regions." One might have thought that Andrée, not to mention others, was of at least as much consequence in the general coterie of scientific students as the two hunters here referred to. We find on p. 264 the name *Pick* for *Pike*, *Elvina* for *Eivina*, and similar inaccuracies in spelling occur elsewhere.

The Funk & Wagnalls Co. will bring out a translation of J. Grasset's "Demi-fous et Demi-responsables."

The two-hundredth anniversary of the birth of Linnæus will be celebrated on a grand scale in Upsala on May 23 and 24, under the auspices of the scientific associations of Sweden. Invitations have been sent to the leading learned societies, to famous naturalists, and to the universities of Germany and other lands to participate in the celebration. Among those who expect to be present is the veteran zoölogist of Jena, Prof. E. Haeckel.

The Munich *Medizinische Wochenschrift* reports that the Bundesrat has definitely decided that, beginning with the coming summer semester, candidates can enter upon the study of medicine who are graduates only of the Oberrealschulen, and that accordingly they need offer neither Latin nor Greek. It is, however, demanded that before admission to practice the medical graduates must show that in the meanwhile they have taken the Latin course in the semi-classical Realgymnasium through the Lower Secunda class; for this a testimonial from the authorities of a secondary school suffices, no examination being demanded.

Drama.

Die Jungfern vom Bischofsberg: Lustspiel von Gerhart Hauptmann. New York: G. Stechert & Co.

Nearly a year has elapsed since Gerhart Hauptmann published his four-act *Glashüttenmärchen*, "Und Pippa tanzt!"—a unique departure in the fantastical that provoked the student of German drama to renewed interest in the Silesian artist. Now, while the literary world is again expecting something new and worthy from his pen, he offers a five-act piece termed a comedy, tossed off in the interval between his last serious efforts. The result is distinctly disappointing, for it is neither a good comedy nor a comedy at all; and even those of Hauptmann's admirers, who assert that a poet should write all that bubbles within him, must wish that he had suppressed this play before it was staged, or even printed. Of late, Hauptmann has steadily kept pace with Sudermann in turning out drama after drama; but this last work from the shop of "Die versunkene Glocke" suggests the thought that if Hauptmann were to retire from the lists awhile and recuperate those forces once so fruitful and promising, his ultimate position in literature would be higher and more secure.

To begin with, there is no plot in "Die Jungfern vom Bischofsberg," or none that seems worthy of Hauptmann, though, to tell the truth, the author of "Hannele," or even "Fuhrmann Henschel," was never famous for laying out, or at least completing, the plots of his tales. Agathe Ruschewey, a half-orphan and one of four daughters living on a country estate on the Saale, was courted by Dr. Grünwald, who, discouraged by her father, buried himself in the pampas of South America. In the

meantime the father died; the girl became ill, and was the recipient of attentions from Dr. Nast, the town *Oberlehrer*, a man of ability, but dried to the core with book-learning and fastidious notions of propriety. On Agathe's recovery, Nast urged his suit; and supported by a busybody aunt, wrung from the timid and distracted girl the promise of hand and heart. But now Dr. Grünwald returns and becomes the guest of the guardian uncle. The arrogant teacher is deluded by a vagabond, who exhibits a carved ivory cross (belonging to one of the girls), pretends that he found it at the bottom of an old well, and induces the pedagogue to explore the pit for other precious antiquities. The vagabond's plan is, in reality, the scheme of Otto, an adopted son and art student, whom Nast had offended. The ragged beggar and the silk-hatted *Oberlehrer* explore the well at the moment chosen for a family picnic nearby. They bring to light a chest, apparently very old, but containing various kinds of modern sausage, placed there half an hour before by Otto. The realization that he has been made a laughing-stock so piques Dr. Nast that he retires; and Grünwald, of course, appears to press his claims.

The above outline shows how shallow is the story, how hackneyed the material, recalling more than one incident in mediocre novels, such as Sudermann's "Es War." Moreover, the *Lustspiel* is almost wholly wanting in real humor, and can pass as a comedy in neither the modern nor the older classical sense. For downright fun it falls short of Hauptmann's earlier "Schluck und Jau"; and one may look in vain for the scintillations of repartee characterizing the model "Minna von Barnhelm." Nor are there any vivid scenes such as in the tavern in "Und Pippa tanze!" unless the intrusion of the vagabond with his ladder at the family festival be admitted in comparison. There are eighteen characters, but none except Nast is real flesh and blood; some, including Agathe, are tolerable suggestions of reality, but several are mere phantoms. The play contains some vinegary observations about education and a poke now and then in the ribs of the arrogant German *Schulwesen*—as when the inflated Nast is made to exclaim, "Die deutsche Schule ist musterhaft! Musterhaft, sage ich: das ist eine Tatsache!"—but there is neither the sharp satire of "Der Biberpelz" nor the dialectical novelty and mystical charm of "Und Pippa tanzt!" Of all the works of Hauptmann thus far given to the world—and how rich in variety and genius they are, after all!—"Die Jungfern vom Bischofsberg" is least likely to contribute to his lasting fame. How far it fell short of the expectations of the crowd that fought its way into the Lessingtheater in Berlin may be judged by the comments of the daily press, in which such expressions as *tieftraurigen Abend, verlorenen Abend*, and *Theaterskandal* were frequent.

Leo Ditrichstein has long been known as a writer of more or less successful farcical comedies, not always of the most admirable description, but his name has never yet been associated with a piece of such solid quality as "The Ambitious Mrs. Alcott," which he has written in collaboration with Percival Pollard, and which was presented for the first time in this city in the Astor Theatre on Monday evening. This is a genuine comedy of intrigue, belonging to the same class as the "Dora" of Sardou and Merivale's "Forget-Me-Not," and not unworthy of comparison with either of them. If less ingenious in construction than the one and less cleverly written than the other, it is an uncommonly well-made play, with an effective story, lacking neither in dramatic or human interest, in which a striking climax, showing considerable facility in invention, is followed by a natural, pathetic, and satisfactory ending. Moreover, it contains some good characterization and reflects certain phases of Washington life with no little veracity. The story deals with the effort of an American diplomat to prevent the marriage of a younger brother with a brilliant woman, who was once the heroine of a secret court scandal in Europe. He is defeated at all points, but an incriminating document, giving the full facts in the case, falls by accident into the hands of a certain Senator, who proposes to use it. In this extremity Mrs. Alcott appeals to an elderly ambassador, who is familiar with her antecedents, and who has long been among her admirers. He secures an order for the suppression of the document on the ground that it is a state paper, and when this device seems likely to fail, boldly seizes an opportunity of destroying it. But the excitement proves too much for him, and in the moment of victory he falls dead. The shock breaks Mrs. Alcott's spirit, and she retires from the field, making full confession and surrendering her lover, who was already cooling in his suit, to a younger and purer rival. Her fight for happiness and honor gives occasion for a series of highly effective scenes, and the suspense concerning the final outcome is maintained with indisputable skill. A better acting play has not been produced for a long time, and it is for the most part entirely reasonable and natural. As a rule the acting is decidedly meritorious, but Mr. Ditrichstein, with his broken English, made a mistake in assuming the part of a native-born American. In spirit and manner his performance was very good. Miss Dorothy Dorr played the heroine with intelligence, feeling, and spirit, and William Hawtrey was admirable as the amorous foreign count. The entire representation was creditable.

In J. Hartley Manners's comedy, "A Marriage of Reason," which was produced in Wallack's Theatre, on Monday evening, the old theme of the marriage of American heiresses to impoverished English noblemen is treated in a fresh and, but for poor workmanship, ingenious manner. The idea is good, but the illustrative details are unacceptable. Lord Delcombe, soured by the infidelity of his first wife, whom he has divorced, becomes a confirmed cynic and maintains that sentimental marriage is an absurdity. But as gambling has brought him to the verge of utter ruin, he proposes marriage to an American heiress upon a purely rational basis, she to enjoy the social advantages of his title and he to have the spending of her money. She agrees, and they begin a platonic union, which proves tolerably successful, until each perceives the special virtues of the other, and begins to wish for more genial relations. Mutual misconceptions gradually breed a wider estrangement, and a dissolution of the partnership seems imminent, when explanations bring about a perfect and permanent reconciliation. There is clever writing and some situations are effective, but the general construction is slipshod, and the whole working out of the plot is altogether theatrical and conventional. The dramatic value of the piece is slight, but the dialogue is of decidedly superior quality and the sentiment, if somewhat hysterical in places, generally sound. Much worse plays have been more successful than this is likely to be. Mr. Bellew enacts the hero with a finished comedy skill rare in these days, but the part of the heroine has been entrusted to weak hands.

A dramatized version of the first part of "The Pilgrim's Progress" has just been played in London for a hospital fund. The dramatization was done by Mrs. W. Hadley and Miss E. Ouless, who kept strictly to the words of the book in the scenes chosen for representation. A representative of Bunyan declaimed the latter part of the introductory "apology" and the whole of the epilogue; and a good many of the incidents were shown in tableaux, such as the wicket gate, the removal of Christian's burden, the arming of Christian, the martyrdom of Faithful, the River of Death, and the Celestial City. The scenes in which dialogue occurred were the City of Destruction, the Valley of Humiliation (with a combat with Apollyon), Vanity Fair, and the Delectable Mountains. The part of Christian is said to have been played with remarkable success. Miss Crosman expects to play Christian in this country before long.

Music.

Twenty Piano Compositions by Mozart. Edited by Carl Reinecke. Boston: Oliver Ditson Co. $1.50.

Although Mozart wrote seventeen sonatas and many other pieces for pianoforte, his name seldom appears on present day recital programmes. For this there are good reasons. Most of his compositions were written for the clavichord and the harpsichord, the pianoforte's predecessors, which had a thin tone of very brief duration. To make up for the absence of sonority a multitude of runs, grace notes, and other ornaments, were introduced, which are no more to our taste than the *fioriture* of Rossini and Donizetti. Moreover, he kept his best melodies, as a rule, for his operas and symphonies; many of his piano pieces were mere *pièces d'occasion*, in which there is much that is trivial and commonplace. Mr. Shedlock, in his book on the Pianoforte Sonata, goes so far as to say that to his thinking the sonata in C minor is the only one in which Mozart was entirely absorbed in his art. This may be true of the sonatas as a whole, but in most of them there are sections that are worth keeping before amateurs and students.

Hans von Bülow declared that the time had come when, in order to keep Haydn and Mozart among the immortals, we must amputate the dead and dying parts of their

compositions—in other words, print collections of only their best pieces. Dr. Reinecke's volume of twenty-one pianoforte pieces was edited from this point of view. It would have been too much to expect this arch-conservative to "amputate" parts of the individual sonatas themselves, preserving only a movement or two in each case; but he has chosen the best four sonatas for his collection, and added to them four fantasias, beside a suite, some minuets, (including one which Mozart wrote at the age of five), some sets of variations, and divers other pieces. Dr. Reinecke was certainly, of all living pianists, the one best qualified to make such a selection; for decades he has been famed as a Mozart specialist. He has written a pamphlet pleading for a revival of Mozart's piano-concertos, and the present volume he has provided with an excellent introduction relating to his idol's life and works. The current opinion regarding Mozart's music is that it is uniformly placid; but perhaps some of the performers will agree with Reinecke that "the works of such a fiery spirit as Mozart must not be played merely with a certain dignity and moderation, but in the proper place there must be sparks and brilliancy." In one thing the editor is certainly right: in maintaining that Mozart's music should be played without *tempo rubato*; Mozart himself wrote: "I always keep time strictly." He sanctioned, at most, a slight freedom of movement in the right hand while the left followed the metronome.

The season's last operatic event of importance is the return of Emma Calvé to New York, Oscar Hammerstein having secured her for eight appearances at the Manhattan Opera House in "Carmen," "Cavalleria Rusticana," "La Navarraise," and perhaps "Faust." When this remarkable French singer and actress came to this country for the first time, in the season of 1893-94, her Carmen created such a sensation that Bizet's opera had thirteen performances at the Metropolitan Opera House. She has come to be looked upon as the greatest of all Carmens, eclipsing the pleasant memories of even Pauline Lucca and Minnie Hauck. The only drawback to a thorough enjoyment of her impersonation of this rôle in recent years has been a growing disposition to take undue liberties with the composer's rhythms in the love music of the last act and in a few other places; luckily she seems to have outgrown this, and her latest appearances as Bizet's gypsy girl have been quite as fascinating as of yore. Perhaps no singer on the operatic stage (unless it be Geraldine Farrar) has ever had a face which so constantly and subtly mirrored every thought and emotion in the text and the music; given a general knowledge of the plot, no one needs a libretto to follow the dialogue when she is on the stage. Her voice has also preserved nearly all of the luscious beauty it had a decade ago, while her style is highly polished. It is a pity that opportunity will not also be given to hear her as Ophélie in Ambroise Thomas's "Hamlet," a rather poor opera, which, however, gave her an opportunity to convince astonished music lovers of modern taste that even *fioriture* which had seemed flimsy ornaments as sung by other prima donnas could be saturated with dramatic feeling.

At the two extra Philharmonic concerts to be given at Carnegie Hall, Friday afternoon and Saturday evening, Wassily Safonoff will make his last appearances before his departure for London, where he has been engaged to conduct several concerts of the London Symphony Orchestra. The programme for these two supplementary concerts will consist of Tchaikovsky's "Pathétique" symphony, Rubinstein's concerto in E flat major for piano, and the overture to Wagner's "Tannbäuser." Josef Lhévinne, who was so successful at his previous appearances at the Philbarmonic, has been engaged as soloist. The orchestra for these concerts will consist of 110 players.

At a recent concert given by the Royal Orchestra in the Opera House at Berlin, Mr. Felix Weingartner introduced to the public a symphonic work by Dr. J. Paul Ertel, in which an attempt is made, by liberal use of the drums, to suggest an eruption of Vesuvius. The composition, which is entitled "Pompeii," is designed to picture in tones a revival of that perished city, and its renewed destruction by the volcano. Among the many themes employed one hears frequent repetition of snatches from the familiar song, "Funiculi Funicula." The piece closes with a prolonged sullen growl from the drums, which is meant to indicate that the gay life of the new city of pleasure has been smothered under a blanket of lava and ashes. The work was very well received.

"The Art of Counterpoint and its Application as a Decorative Principle," by Dr. C. H. Kitson, will be published soon by Henry Frowde. The author points out that those who have had some experience in teaching the science of music will have found that the general crudity of students' work in applied counterpoint, that is, in fugue and in modern polyphonic writing, is due to the ignorance of the origin, premises, and aims of scholastic counterpoint. By showing the historical status of this, and by tracing principles which are true for all time, Dr. Kitson seeks to prove that scholastic counterpoint is the foundation of all progress under harmonic conditions.

Art.

ARCHÆOLOGICAL WORK IN EGYPT.

CAIRO, March 2.

One's first impression of Egyptian exploration methods is somewhat painful. All considerations of sentiment and reverence for the dead are being swept aside in the modern demand for knowledge. In the new and spacious Museum of Cairo the proud monarchs who ruled the Mediterranean world, who lived in the greatest luxury and refinement, and built the most superb tombs, now lie side by side in rude coffins which would not have been considered fit for favorite slaves. By the irony of fate the ruling religious passion of their lives, a well provisioned and secure burial place, has been denied them, and they can now be viewed for five piastres. Mummy cloths cover Seti and the Rameses of three generations, the still impressive faces alone being visible; but the bodies of Ua and Tua, which were buried with the greatest love and care by their daughter Queen Tyi, are completely exposed, with the golden plate of the embalmer at the side.

The very costliness was, of course, the fatal error in these burials. The first robberies detected by archæologists are those of the trusted and well-paid undertakers themselves, who slipped out the jewels from beneath the massive and slowly descending lids of the splendid sarcophagi. Then came the plundering by the Egyptians during the loosely governed period of priest rule, followed by the plunderings of the successive waves of conquerors of Egypt, and the long and extremely artful plundering of the Arabs, which is still in progress despite precautions of the Government. Finally, in the nineteenth century there arrive the scientific grave robbers, animated by loftier motives, but the most thorough and ruthless despoilers of all—digging on a vast scale, with small armies of highly trained and well organized laborers.

At one of the great excavations which I visited a vertical section seventy feet deep had been cut through the burial places of six successive civilizations, terminating with the Greek, Roman, Coptic, and recent. Skulls grinned at us from every corner, limb bones lay about in profusion; at one point twenty or more coffins were huddled side by side. Since wood is extremely scarce in Egypt, these coffins when broken up into splinters are set aside until evening and then divided among the laborers as a special gratuity. Formerly the skeletons were treated with similar unconcern and perhaps sold to be ground up into "mummy paint"; but now that the scientific value of the skeleton as a means of determining race is recognized, they are carefully kept together in most of the excavations, placed in small boxes, and sent to Dr. G. Elliot Smith in Cairo for comparative study. The very important conclusions drawn from this relatively new branch of Egyptology, namely, the unity of the Egyptian race from the palæolithic to the present age, are chiefly due to this modest but distinguished anatomist.

One's second impression of the modern work here is that the period of brilliant discovery has passed by, the chief exceptions being the extraordinarily successful finds of Theodore M. Davis at Luxor. The period has set in of exact, patient, and exhaustive research, animated by the German spirit of thoroughness. It is generally conceded that France, the country which with several men of genius led the way, is not at present holding its own. G. C. C. Maspero, the director of the Museum as well as of Egyptian archæological research, a man of great erudition, beloved and respected by all, is now advanced in years. The arrangement, or conspicuous lack of arrangement and labelling, of the wonderful collections in the new Museum, is a sign of the need of some energetic new blood in this institution. Similarly, the work in the field, in the many "concessions," as they are called, along the Nile, sadly needs coördination. At some points the methods are quite beyond criticism, not a bone or a token or a record which could possibly be of any value as historical evidence is lost. Careful photographs are taken at every stage of the work. The mastering motive of the present

period is the search for historical evidence, not for museum loot; and such evidence is often found in ways and objects of little or no museum value, certainly of no exhibition value. At other points some impatience for more immediate and striking results may be observed; certain museum authorities at home who are supplying the funds must be kept in good humor by a not infrequent shipment of exhibition material. This is the spirit of the "head hunter" in palæontology, of the man who sacrifices the skeleton of an extinct animal for the more striking head. It is this diversity of aim and of method which should be held in check by the central authority of the Cairo Museum. While the materials of research differ with the different dynasties, the problems are everywhere the same, and the methods should be the same. When Mariette, the famous French explorer, left few detailed records of his excavations, Egyptian history suffered a severe blow. Now that an enormous amount of evidence has been destroyed or thrown into the dump heaps, one is convinced that every shred which survives must be scrunulously preserved.

It is gratifying to an American to find his countrymen taking a prominent if not the leading place in the present excavations, to hear of American funds liberally contributed, and of American scholars at work all along the Nile from Giza to Wadi Halfa. Prof. James H. Breasted's volume is regarded as a standard history of Egypt; the author is now copying all the inscriptions between Assouan and Wadi Halfa, or the first and second cataracts. Materials for even more thorough historical writings are being gathered by two other Americans—Dr. George A. Reisner and Dr. A. M. Lythgoe. No one is doing more for the art history of Egypt than Mr. Davis. With these men are many younger Americans who will make their place in Egyptology. Especially and above all is it gratifying to learn that the American methods are generally regarded as beyond criticism either as to spirit, scope, or thoroughness. It is earnestly to be desired that the museums and other supporting institutions and individuals at home will also be patient and consider that the prosecution of this investigation must be their chief concern, and that museum specimens are a by-product.

Immense undertakings are now in progress. Beginning our review in the north, we find Dr. Reisner at the Giza pyramids, having extended his field to the abandoned Italian and, as the writer understands, French concessions. He is now in his tenth year in Egypt, and a life work lies before him. For the first seven years he was attached to the University of California, with funds provided by Mrs. Phœbe Hearst; during the last three years he has served Harvard University and the Boston Museum of Fine Arts. At present his excavations are at the eastern base of the smaller of the three Giza pyramids, that of Menkura, where he is removing the enormous blocks of facing granite, which, it is hoped, may have been the indirect means of protecting some sanctuaries of the pyramid temple. Here one may see the perfection of modern excavation; not an iota of evidence escapes; the laborers are the most perfectly trained, the most honest, and the best disciplined in Egypt. The volumes published or now in press under Dr. Reisner's direction are devoted to the culture of the early dynasties, and the connection with the pre-dynastic or prehistoric cultures among the Egyptians of the stone age. One volume is devoted entirely to the first dynasty; another volume covering the first to the ninth dynasties is in preparation.

A few miles farther south Dr. Borckhardt, head of all the German explorations in Egypt, is now engaged in a similarly thorough manner, but not upon quite so extensive a scale, with the pyramids of Abusir in the interests of the Berlin Museum. Continuing down the plateau at Sakkara, the necropolis of Memphis, Dr. J. E. Quibell, the field representative or director of the special explorations of the Cairo Museum, is a most able and enthusiastic excavator. He is in his second year at this point. Here can be best observed the obstacles to excavation. Along the extreme eastern edge of the desert, in the close superposition of successive burials, in the intrusive tombs which cut into the centres or the sides of older tombs, the initial difficulty is to locate a dump which shall not cover some valuable area of future research. Here, too, is best seen the easterly movement of the Libyan sands, which have been the only thing that has effectively concealed these bordering tombs. The Cairo Museum reserves for its own exploration the entire Memphis necropolis of Sakkara as well as the two more southerly pyramids of Dashur. The historical method of search is a time consumer, and even at Dr. Quibell's fairly rapid rate of progress, a half-century will be needed to complete the enterprise.

Some ten miles further south Dr. Lythgoe is beginning his excavations for the Metropolitan Museum of Art of New York. The concession is regarded as valuable, promising fine results. The excavations are starting, as at Giza and Abusir, in the temple on the eastern face of the most northerly of the two pyramids. Like Dr. Reisner, Dr. Lythgoe is a graduate of Harvard, with a special training in the University of Berlin; and he has had five years in the field with Reisner himself. He is the author of one of the important volumes in the Reisner series. He has ample means, which he is expending judiciously with a large force of well-trained workers, and with full realization that the surest results will be obtained by thorough procedure through a long and difficult campaign.

This completes the list of pyramids where work is under way. The ancient southerly pyramid of Medum is reserved for the Cairo Museum, and is not now being touched.

Two hundred miles to the south, near the exquisite Temple of Abydos, Dr. John Garstang is digging in tombs of the eleventh dynasty for the Museum of the University of Liverpool. He has a large and enthusiastic camp of laborers from Guft. Among them are many typical Egyptians, with profiles resembling those on the ancient tombs; perhaps some of these very men or boys have in their veins the widely distributed royal blood. From this region of Abydos is reported an illustration of the vandalism of defective methods. An archæologist, who need not be named, was busy on a valuable conession here for three years without results; he was followed on the very same ground by Dr. W. M. Flinders Petrie, who in two years secured extremely important material, including the names of all the kings of the first dynasty. Dr. Petrie is now in the service of the British School of Archæology.

Opposite Luxor we observed the admirable work of Dr. Édouard Naville, the Swiss archæologist, who has been aided for ten years by the Egyptian Exploration Fund. Just north of the beautiful temple of Queen Hatasu, which he has restored—an object familiar to all travellers in Egypt—he has recently laid bare a much more ancient temple of the twelfth dynasty. We were fortunate in arriving the day of the discovery of an important alabaster sarcophagus believed to be that of King Mentuhotep.

On February 26 Mr. Davis started in his dahbeah down the Nile from Luxor to Cairo, carrying the treasures which he has unearthed this winter in the tomb of Queen Tyi—the latest of his fortunate discoveries. The coffin was found intact, but the body of the Queen was reduced by the dampness of the tomb to dust, which crumbled at the first touch. On her neck were all the scattered golden pendants of a breast plate, or *pectoralis*, and upon her head a beautiful and unique golden crown designed from the mythical vulture, the head and beak descending on the forehead and the delicately modelled wings surrounding the back of the head. But the rarest and most precious objects are the four canopic jars of alabaster, surmounted by beautifully carved portraits of the Queen herself (in place of the four traditional heads of the animal gods of the dead), with inset eyes and eyebrows. In the opinion of Mr. Davis and of others whom the writer has consulted, these heads surpass as works of plastic art anything thus far found in Egypt; they most nearly approach the Greek standard. In the writer's judgment, also, nothing in the Cairo Museum can compare with them in beauty. The expression is wistful and lovable—characterstic of such a woman as Queen Tyi is known to have been. Mr. Davis's concession is very valuable; and, as every one admits, he has worked with exceptional pertinacity, liberality, and good judgment. In 1903 he reached the tomb of Thothmes IV.; in 1904, the tombs of Ua and Tua, the father and mother of Queen Tyi. The contents of these tombs, transferred in entirety to the Cairo Museum, constitute a unique and perfect exhibition of a royal burial. The room set apart by M. Maspero for this collection is certainly the most interesting in the Museum; rich as it is, Mr. Davis will now add the treasures of Queen Tyi. A special volume, succeeding those upon Thothmes IV. and Hatasu, elaborately illustrated, will soon be issued. In 1905 Mr. Davis laid open the tomb of Queen Hatshepsut. In the year 1906 he came upon nothing exceptional, though the Italian archæologist Schiaparelli discovered an unrifled tomb, the entire contents of which he was allowed to transfer to the Turin Museum. Finally, in 1907, the Davis excavations were again richly rewarded by the discovery of Queen Tyi. M. Maspero is so delighted that he has presented to Mr. Davis one of the exquisite canopic jars, which will thus come to America.

H. F. O.

The March number of the *Bollettino d'Arte* is largely devoted to museum acquisitions. The Museum of the Bargello, Florence, has

bought a little Annunciation which is ascribed to that Abruzzi artist whose work is just beginning to be distinguished, Nicola da Guardiagrele. Though cut in stone, these images reveal the habits of the worker in metal. Of the alleged author, Arduino Colasanti can tell little more than that he flourished at the end of the fourteenth century and exercised a great influence in the Abruzzo. From many quarters, so the press dispatches indicate, come complaints of the smuggling of works of art of Italy. A Syracusan director observes that the best Greek coins leave the island by the simple expedient of registering them at Government post offices. Certain frescoes, ascribed to Butinone, which were sawn from the Church of St. Agatha at Pavia have turned up at Paris. On all hands it is agreed that the present law is constantly broken with impunity. The difficulty is chiefly economic. Few will take the risk of expropriation involved in applying for permission to export, when it is known that the Government may seize the object at its own valuation—a mere fraction usually of the prices ruling in London and Paris.

There is little that is new or profound in Elizabeth Luther Cary's study, "The Works of James McNeill Whistler" (Moffat, Yard & Co.), but it is refreshing to find a book on that artist dealing entirely with his art, and making no reference to his personal eccentricities, or to the butterfly letters. Miss Cary deals, by preference, with the "human" qualities in Whistler's work, and finds more of them than would, perhaps, be approved of by the outright Whistlerians. Her "Tentative List of the Artist's Works" should prove a useful foundation for future building.

H. M. Cundall's "Birket Foster" (London: Adam & Charles Black) sets before us an amiable and worthy man, whose minutely stippled and finished drawings of landscape, in the words of the Preface, "appeal to the majority of the British public more than the works of any other artist." Perhaps this is not altogether to the credit of the public, but that it is, or was, true seems amply borne out by some of the stories in the text, notably that of a whole screen full of drawings bought, without examination, by an enterprising dealer, while his rivals were busy making their selections for purchase. The seventy-three colored plates give ample opportunity for the study of the artist's manner of work, but the slight, yet accurate, pencil sketches in the text will give more pleasure to many.

At the auction of the Massey-Mainwaring collection at Christie's, London, March 11 to 18, the following prices were paid for paintings: A. Canaletto, View of the Church of SS. Giovanni e Paolo and the Colleone Monument, £892; F. Clouet, Comte de la Marque, in black jerkin, £756; Quentin Matsys, Louis XI., in purple dress, £630; A. van der Neer, Village Scene, with two windmills, £483; D. Teniers, Woman Lighting a Pipe, interior of a cottage, £420.

Finance.

TREASURY RELIEF FOR THE MARKETS.

Release, by the Treasury to the money market, of some $15,000,000 cash within a week, has brought to the New York Associate Banks, whose position a month ago was the weakest for that date since 1890, the largest surplus reserve reported at the end of March in any but one of the past seven years. The relief was timely, and thereby hangs a tale. When the disorder on the stock exchanges became acute in the early part of March, people began to ask, more or less anxiously, What will the Treasury do to help the market? In this column, last October, were fully set forth the conditions which gave any warrant for such appeal to the Government, the possible methods of relief, and Secretary Shaw's application of them. For several reasons, each of these considerations appeared in a new and somewhat altered light at the opening of March. At that time Secretary Shaw was succeeded by Mr. Cortelyou. The general judgment was that from him no such stretching of the letter of the law could be expected as from Mr. Shaw, who had overstepped all precedent, first by accepting, as collateral against public deposits with the banks, other securities than United States Government bonds; second, by ruling that public money once actually in the Treasury's own vault, could be paid over to bank depositorics; third, by advancing public funds to banks on the express stipulation that such funds should be used in securing gold imports.

But even assuming that Secretary Cortelyou would refuse to follow the precedents of Mr. Shaw, there were also several particulars in which he had wider latitude. In the opening week of March, Congress amended the law which governs deposit of public moneys. To the old law, which had in substance remained unchanged since 1864, there were two serious objections. One was, that it did not allow receipts from customs to be placed in bank—a wise exception in 1864, because payment of duties in gold, instead of depreciated Government paper, was then required, and because this same gold had to be used by the Government to meet the interest on its debt. But, naturally the reason for such exception ended twenty-eight years ago, when specie payments were resumed. The other objection had a more recent origin. The law of 1864 provided that the Secretary of the Treasury should require national banks in which public moncy was placed, "to give satisfactory security, by deposit [with the Treasury] of United States bonds and otherwise, for the safe keeping and prompt payment" of such money.

Around the words "and otherwise," much controversy has recently raged. There was, however, little doubt as to what the phrase meant. In reply to questioning, on the floor of the United States Senate, the author of the proviso declared that it meant the personal bond of a bank president, which had at times been required, not as a substitute for Government bond collateral, but in addition to it. The law, beyond reasonable question, contemplated Government bonds as *sine qua non* for such bank deposits. For several decades after the law was passed, the requirement was met without difficulty. In the past ten years, however, not only have Government deposits in bank risen from $11,000,000 to $150,000,000, but national banknote circulation, against which, also, United States bonds are required as security, has increased from $230,000,000 to $597,000,000; and in the face of this increase in demand for Government bonds, the total supply outstanding is hardly $70,000,000 greater than ten years ago, and would be much less, but for the issues during the Spanish war.

As a result, the banks have found it more and more difficult to get the United States bonds with which to qualify as depositary. In this fact, Secretary Shaw justified his overstepping of the law. The so-called Aldrich bill of six weeks ago disposed absolutely of the absurd exclusion of customs revenue from bank deposits; but it handled the question of collateral security, rather queerly. Instead of revoking the old requirement of United States bonds, and declaring what would be acceptable, it left the old proviso as it stood, merely adding the following sentences:

That the Secretary shall, on or before the 1st of January of each year, make a public statement of the securities required during the year for such deposits. Provided, That the Secretary of the Treasury shall distribute the deposits herein provided for, as far as practicable, equitably among the different States and sections.

In form, this amendment gave no fresh authority; but since the author of the bill declared in the Senate that the proviso for

a statement of acceptable collateral meant that the Secretary might use his own discretion, the Secretary now has ground for assuming that acceptance of State, municipal, or railway bonds is duly legalized. The new Secretary has thus interpreted the law. As to the suggestion that the deposits should, so far as practicable, be "equitably distributed" among different States and sections, the Treasury seems wisely to have decided that distributing "equitably" and distributing "equally" may not be synonymous terms; and that equitable distribution is best achieved by paying back surplus revenue to the money market whence it came. This principle was pursued in the return within two weeks of $15,000,000 customs revenue to New York city exclusively.

How far this new basis of bank deposit of public funds will solve the difficulties of the awkward Sub-Treasury system, is by no means certain. Two unfortunate facts remain, one of them largely due to the Aldrich bill itself. The evil influence, on a market, of constant expectation of "relief from the Treasury," is too obvious to need explanation. The time will come—as it did, a few months ago—when markets will clamor for relief to which they are not entitled Just now a surplus public revenue, since the year began, has taken $25,000,000 from the money market; the Treasury's duty was, to give it back. But if the Treasury had not drawn on the market, or if, having done so, it had already redeposited, and could therefore offer no aid to a money stringency, we should see the Nemesis of the system. At best, there is a grave and dangerous responsibility imposed on the Secretary—a responsibility which might lead to such an extraordinary idea as Secretary Shaw set forth in his last annual report, that with $100,000,000 cash placed by the Government at a free disposal of the Secretary, he could prevent financial panic, here or abroad. This would be sheer and demoralizing paternalism.

The other troublesome possibility lies in the uncertain terms of the Aldrich act. If the only authorization for other than Government collateral, against public bank deposits, is an instruction to the Secretary to declare once a year what security he is willing to accept, what limit does it set to the kind of security accepted? As a matter of fact and law, it sets none at all; the presumed conservatism of the official himself is the only safeguard.

A NEW BOOK BY Arthur Christopher Benson

Ready Immediately

Beside Still Waters

Uniform with "The Upton Letters." Crown 8vo, $1.25 net.

A record of the sentiments, the changing opinions, and the quiet course of life of a young man whom an unexpected legacy has freed from the necessity of leading an active life in the world of affairs. The book aims to win men back to the joys of peaceful work, and simplicity, and friendship, and quiet helpfulness. It is, too, a protest against the rule or tyranny of convention, the appetite for luxury, power, excitement, and strong sensation.

NEW YORK, THURSDAY, APRIL 11, 1907.

The Week.

Mr. Roosevelt announces that he regards the Presidential campaign as already on; and that he is going to make it "hum" from now on. Any one can see, from the loud series of explosions with which Mr. Roosevelt's racing machine starts off, that it is likely to be run under tremendous pressure. The usual excitements will appear as tame as crocheting by comparison with the earth-shattering thrills which the President has in preparation. Already he is bundling off the stage the old properties which once sufficed to make the people's eyes start from their sockets. The well-used Trust, a mere *Octopus vulgaris*, has no terrors fit to be named with those of the hobgoblins and chimæras dire with which President Roosevelt is to affright us. The monsters whom he sees gathering in the White House grounds are of a prehistoric bulk and ferocity. He notes them unwinding the scaly horrors of their tails, and hastens to apprise the public of the fearful things in store. We are in for a campaign which will make the apocalyptic visions of the Bloody-Bridles Populist seem like a midsummer night's dream. Seriously, we cannot wonder that the President's friends are disquieted at his ready acceptance of these gross inventions and his sending them out to the country as not only credible, but as the sole guide to political action. Now, if any tyro in politics should put about such a fantastic tale, experienced heads would wonder how he escaped from the nursery. In so hardened a practitioner as Mr. Roosevelt, the symptom of gullibility is really disturbing. It argues that he is so overwrought by his labors that his ordinary good judgment is not brought to bear. While he is in this high-strung state, the thing for the country to do is to be, like Marjorie Fleming, "most unusual calm."

Paul D. Cravath's argument before the Interstate Commerce Commission last Thursday in favor of the Chicago and Alton trausactions was prefaced by a frank admission that times and public sentiment have changed. Since the deal had been made, he affirmed, the moral aspects of such phases of high finance receive more attention than heretofore. The same might truthfully be said of the insurance methods of a few years ago; public opinion in regard to them has also undergone a notable change. But the question remains whether the people at large would ever have condoned such practices had they known or understood them. So far as the insurance matters are concerned, we do not believe for a moment that public sentiment—and by that we do not mean Wall Street—would ever have approved the obnoxious deeds. In brief, we do not think that the moral standards of the people have undergone any alteration whatever; publicity has simply given opportunity to apply them, as was not previously possible. Mr. Cravath is correct in saying that the Alton transactions were reported when they occurred; it was not, however, until they were brought out as a whole before the Interstate Commerce Commission that the public fully realized what they meant. Gratifying as is Mr. Cravath's assurance that the corporation managers have seen the handwriting on the wall, they must not expect the public to restore them to confidence and favor until they have given proof that they will live up not only to what they call the new moral standards, but those of the future as well. By no means all of the directors and managers have sinned in ignorance, or because what they did was the custom of the Street. On the contrary, there are lawyers, as Mr. Cravath must know, who have frequently warned their clients that this or that reorganization or combination was illegal, and might even lead to the penitentiary —only to have their advice disregarded. As to the standard of the future, it requires no astrologer to read it in the stars. The Decalogue is still in existence; the standards of private morality and conduct are fixed; the relationship of public corporations to stockholders need never vary much from those of the trustee or guardian to his ward. And above all, frankness and openness will be requisite. If Mr. Cravath's clients and those like them are ready to adopt these standards for the future, the public may look with more favor upon Mr. Depew's appeals for silence in regard to the past, because it is the past.

The dinner which the New York *Staats-Zeitung* gave to Ambassador Tower Monday evening was a merited recognition of his efforts to compose a difference about tariffs, and to preserve friendly relations between his country and Germany. In one sense his task, with that of the North Commission, has been an easy one—the German Government has done everything in its power to bridge over the difficulty. As Mr. Tower explained, Germany has recently made reciprocity treaties with seven of the leading European countries; her people cannot understand why the United States does not jump at the chance to conclude a similar agreement with her. Thus far a tariff war has been averted only by what may be termed the unusual international courtesy of the Imperial authorities in passing, in February, 1906, a law extending until June 30, 1907, the conventional German tariff rates. In view of the Ambassador's expressions at the dinner, it is obvious that some further agreement has been reached which will permit of the continuance of the present status. But this again is merely a stop-gap. Thus far, as Mr. Tower testified, the Kaiser and his advisers have approached every matter relating to the United States in a most conciliatory spirit. They seem to have understood the difficult position in which the State Department finds itself in endeavoring to do what our importers and exporters wish in the face of a supremely indifferent Congress. It would be hard to find a better illustration of the selfishness and indifference of protection. There is no other cause of difference between the two countries. In literature, music, and art there is the freest of trade—even to the exchange of professors. The groundless fears of German interference in South America, the equally absurd allegations of a German desire to take over the Philippines, have disappeared as rapidly as the stuff that dreams are made of. It therefore behooves every friend of peace and of progress to bring pressure to bear towards the solution of the problem upon which Mr. Tower and Mr. North have been working. Serious friction between the United States and the German Empire is inevitable if our Aldriches and Cannons are to continue to direct our tariff policy.

Secretary Cortelyou's plan to convert $50,000,000 of the maturing United States 4 per cent. bonds into 2 per cent., instead of paying them off, has in reality a double reason. The amount which would be involved in cash redemption is very large, and the retirement of so many United States bonds would inevitably contract the bank-note circulation, for which such bonds are a required security. In all, nearly $112,000,000 of these 4 per cents are due for redemption July 1, and of these some $27,400,000 are pledged against bank circulation. The redemption of the "fours of 1907" will remove the last of the specie resumption issues. Part of this loan was issued by Secretary Sherman, between 1877 and 1879, under authority of the Specie Resumption act of 1875, which empowered the Treasury to sell such bonds for the purpose of redeeming the outstanding legal tender notes. Although this maturing loan is the last of the "resumption issues," it is not the

last of the 4 per cents. There will still remain, subject to redemption in 1925, some $118,000,000 of the 4 per cent. loans made to repair the Government's gold reserve in the troubled days of 1895 and 1896. Conversion of these $50,000,000 maturing 4 per cent. bonds into 2 per cents is apparently strong testimony to our national credit. Great Britain's 2½ per cent. consols have lately fallen below 85, French Government 3 per cents are selling at 94⅞, and New York city finds it difficult to float a 4 per cent. loan, except at a discount; yet the United States Government gets par for its 2 per cents. But there is an artificial cause at work. Bank circulation must be secured by United States bonds, and note issues have in the past ten years increased $370,000,000. Until Secretary Shaw relaxed the law in regard to government deposits in bank, and the Aldrich act of last month in clumsy fashion legalized that action, government deposits had to be secured by pledge of United States bonds; and the amount of such deposits has risen $140,000,000 in the decade. It is this artificial market for the bonds which holds them at an unreal valuation.

Charles M. Schwab's emphatic declaration that the Bethlehem Steel Corporation is going out of the business of building ships for the Government, was undoubtedly a surprise to the public. At the annual meeting of his company last week he declared:

> I never knew any one to make money out of battleship construction. We have conclusive evidence of this, for we have charged off altogether a $3,000,000 loss from the shipbuilding companies. In the construction of the three ships now building at the Union Iron Works we have in the past year charged off $1,725,000.

This San Francisco loss was in part due to the earthquake, and in part to changed conditions in the trade, the contracts having been taken five years ago, when both materials and wages were cheaper. But the real reason for the loss on warship contracts, Mr. Schwab declares to be "the succession of unreasonable delays caused by governmental red-tape. On account of the delays caused by inspections, changes in specifications, and so on, the progress of government work is slow and costly. I have sometimes thought that it was possible to turn out more tonnage in steel for a private customer in a month than can be turned out under present methods for the government in fifteen years." Mr. Schwab's statement, as every one familiar with Governmental methods knows, is hardly too strong. It does take about five years to complete a contract for a battleship, whereas in England a Dreadnought may be afloat and in service within two years. Our shipyards are not lacking in efficiency or enterprise; the trouble is chiefly that our Navy Department, generally behind the times in its designs, endeavors to modernize them while the ships are well under way. The naval architect, Joseph R. Oldham, has recently in *Cassier's Magazine* told of a case in which it took our Navy Department nine months to make an approved working drawing, out of a plan which embraced not one-fiftieth of the length of the hull, and but one element of the construction of one deck.

One of the moderate results which William T. Stead hopes to see attained in the approaching Hague Conference is a general agreement among the signatory Powers to abstain from "piratical" warfare, by allowing a period of thirty days to elapse between the rupture of diplomatic relations and the beginning of hostilities. There are Frenchmen, we are told, who pick up their papers in the morning expecting to read of the advance of a German army on Paris, and there are Germans who dread the sudden appearance, like Aphrodite rising from the waves, of a British fleet at Kiel. Under the new rule there would be no ground for such fears of sudden war and devastation. Yet it is hard to see what benefit to the cause of peace would come from an attempt to apply to war the etiquette of the duel, with which Mr. Stead contrasts the Western barroom method of getting the drop on your man. If Russia accuses Japan of "uncivilized" conduct in attacking without a declaration of war, the latter might retort that acute negotiations extending over more than a half-year should have been sufficient warning to any Power that was not completely befuddled as to the seriousness of the game it was playing. So France need scarcely fear an overnight invasion by Germany, or Germany by England. The press in each country would be sure to give warning weeks before, as in the Morocco crisis of 1905. On the other hand, what Mr. Stead said at Plymouth Church Sunday concerning the rôle that this country is bound to play in the propagation of the gospel of peace, because of the fact that we are "the most international of people," is as sound as it is agreeable. The fact that we have among us representatives of all the European nations, domiciled as citizens, yet bound to their trans-Atlantic origins by ties of varying intensity, gives us a legitimate interest and influence in European matters. Mr. Stead proposed a peace pilgrimage of Americans to the various European capitals before the assembling of the Hague Conference. Getting to know people removes misunderstandings and promotes friendship. Yet such a process of rubbing up against each other is, as the speaker pointed out, already in progress on a vast scale in this country.

The decision of the trustees of the Carnegie Foundation for the Advancement of Teaching, not to grant retiring allowances to professors in State institutions, will surprise no one. Mr. Carnegie has given but little to State universities. As he has more than once declared, he believes that gifts from him or from other outsiders may tend to weaken the interests of the people of a State in their own university and lessen their sense of responsibility for its maintenance and development. The Executive Committee of the National Association of the State Universities has presented a strong argument for these pensions. The committee points out that the salaries in State universities "do not vary essentially from those in other institutions" which share the benefits of the Foundation; that the State universities, like private institutions, "have grown by the struggles and self-sacrifice of individuals," who "in their old age find themselves unable to call upon any corporation or individual for assistance"; and that without the Carnegie pensions the "State universities will certainly be at a great disadvantage." President Henry S. Pritchett of the Foundation replies that the Western State Universities are now receiving generous support. The total income of Michigan, Missouri, Iowa, Wisconsin, Kansas, California, Illinois, Minnesota, Nebraska, and Colorado was $1,689,200 in 1896; it was $4,577,700 in 1906. The teachers of State universities, he admits, have, "as teachers, quite as good a claim to a retiring allowance system as have any other teachers." The policy of pensioning is also as desirable in State universities as elsewhere; but "retiring allowances, when established in State institutions, should be established by the States themselves as a part of the legitimate expenses of higher education." President Pritchett, like Mr. Carnegie, fears that the intervention of a private agency may "greatly weaken the sense of responsibility of the States for educational support." The experiment, then, of withholding the Carnegie pensions from State institutions is to be fairly tried. The people of most Western States, we think, take great pride in their universities, and will not see them outstripped by private institutions. If the private college, by means of the retiring allowance, begins to attract the stronger members of the faculty, the State is likely to offer a similar inducement. If this, however, is not the effect, the Carnegie Foundation can change its policy to suit conditions. In the meantime, however, individuals of the faculty must continue their sacrifices.

If a brave heart and firm determination were the only requisites, the announcement that Peary is again to go to the Arctic would mean that the North

Pole is as good as discovered. Unfortunately, the unforeseen and unforeseeable are to be reckoned with in 1908 as in 1906. On his last trip Peary would have reached the Pole if he could have carried enough provisions with him. All his arrangements were sufficient for an ordinary Arctic summer, but the exceptional season frustrated his plans. Each expedition, however, renders him better able to face the problems of the Far North, and this fact has undoubtedly aided him in getting together the $200,000 needed for this, his sixth expedition. One great change has certainly come over Arctic exploration in recent years. The dangers have been largely diminished by reason of greater care and knowledge. Time was when the departure of an expedition meant the certain end of the ship and of at least some lives. The loss of the Polaris, the Jeannette, and the Rodgers, in quick succession, and the disastrous Greely expedition, all tended to fix the impression in the public mind that exploration of this kind was about the most foolhardy undertaking on the globe. Now big ships and little go to the Arctic or Antarctic—Amundsen sails in a cockleshell clear across the American hemisphere—with far greater ease and safety than the early explorers crossed the western ocean. This changed feeling is, however, not true of those who would balloon to the Pole. The world at large would take much greater stock in these ventures if there were first trial trips, say, from New York to Chicago or in some colder climate.

Britain's undeniable instinct for recognizing the inevitable in political evolution and yielding wisely because in time, would seem to be on the point of finding its latest illustration in Egypt. There the demand for greater powers of self-government will not down; and minimize as the Conservative English press will this Nationalist movement, we must be not unprepared for a sudden about face on Egyptian affairs similar in kind, though not, of course, in degree, to that exhibited by leading British Unionist journals the moment self-government became a fact in the Transvaal. Certainly, it is of great significance that Lord Cromer in his latest annual report should have come out for a modified system of home rule and a policy of placing a greater number of public offices in the hands of natives. At present the Khedive, as nominal ruler, is assisted hy a Legislative Council of thirty members, of whom fourteen are nominated, and a General Assembly, comprising the Legislative Council plus the six Ministers and forty-six elected members. The General Assembly "has no legislative functions, but no new direct or personal tax can be imposed without its consent." When we are told that Lord Cromer's proposals call for a legislative council composed of twenty nominated and sixteen elected members, the concession to national desires will be not in the mode of its selection, but in the fact that it will possess "full power to deal with Egyptian affairs, subject to the veto of the British and Egyptian Governments." The great argument against home rule for Egypt has been the "demonstrated" incapacity of Orientals for self-government. Against this conception the Khedive recently protested in a remarkable interview with a correspondent of the Paris *Temps*. He dwelt upon the "prodigious facility wherewith it [Egypt] assimilates itself to European culture," its advance in agriculture and the mechanical arts, and its general economic progress. "It is now time," he said, "to devote all our efforts not only towards the material welfare of the population, but toward the satisfaction of their intellectual and moral requirements."

Mr. Birrell has been long enough Chief Secretary for Ireland to have had very interesting experiences. Primarily he has, as he expresses it, found himself, what he never was before, in angry controversy with himself as Chief Secretary and head of various departments. Ireland has already, he declares, made him a victim to its charm, and he maintains that the day has gone by when England can take it upon herself "to treat Ireland as a naughty child, on the principle of 'Go and see what she is doing and tell her not to do it.'" But though he is able to joke about his beliefs and findings with that exquisite humor which has resulted in his being dubbed the wittiest of Ministers, he has found much of pathos in his work, as Mr. Bryce did before him. Take, for instance, the educational situation. There is a highly centralized system, imposed by England, with a central board at Dublin controlling the school finances, but without any local authority to contribute to its expenses, and itself not amenable to any responsible person. For this Mr. Birrell sees no foreign remedy; Ireland must cure her own evils in this respect. But the schoolhouses he found in such a scandalous condition that he was "almost willing to throw aside all the principles he ever professed if he could only get cash down." As a first step forward he has obtained from the Treasury the sum of $200,000 a year for three years to begin rebuilding. But the smallness of the teachers' salaries and their scant opportunities for promotion are even more discouraging; and to these evils Mr. Birrell is also devoting his attention. Finally, on the question of the Irish language he concedes the entire right of Ireland to ask for its teaching in her schools.

The declaration of the Congress of French Independent Socialists against the employment of the general strike as a political weapon is symptomatic of a difference of opinion which exists within Socialist ranks in all European countries. The theory of the general strike is of recent growth; it rose to sudden prominence about four years ago; triumphed signally in Russia, where the manifesto of October 30, 1905, was directly won by the great national three-days' strike, and in Austria, where the imminence of a general cessation of labor wrested the grant of universal suffrage from the Government; but has since declined as suddenly as it rose. In Germany, Bebel fought the movement for a general strike at a time when the majority of German workmen, it is said, were eager to join issue with the Government under the spell of enthusiasm engendered by affairs in Russia. Bebel saw that the general strike was a dangerous weapon to play with. Successful as it might be in a cause that enlisted the sympathy of an overwhelming majority, as the case was in Russia and Austria, the situation was different in Germany, with a firm Imperial hand on the helm. There a general strike was sure to lead to civil war, and the Socialist leader hesitated. Moreover, a general strike, to stand any chance of success, involved a terrific strain that was sure to be followed by a corresponding reaction. This was exemplified in Russia, where a second general strike, proclaimed in November, 1905, proved a disastrous failure.

Chancellor von Bülow's recent declaration about himself, "this has been an Agrarian Chancellor," has only served to arouse the indignation of the Liberals, whose support he has sought to obtain. The Radicals, in particular, are recalling that Liberalism has had no dearer enemy than the Agrarians, whom they have opposed not merely on economic grounds, but because they wished to war against feudalism in a modern state and the exploitation of labor in the interest of the landlords. In short, the Liheral campaign against special privilege has been waged as persistently as anywhere in Europe. When one considers, too, that the Agrarian policy has meant the continued domination of the Prussian *Junker*, the creating of artificial prices, and the taxation of even the most necessary articles of food, one can but wonder at the Chancellor's readiness to identify himself with it. No one can assert that this action smacks of statesmanship, or even of the shrewdness of the time-serving politician, however courageous and frank it may be. On the other hand, all that the Chancellor has to offer the Liberals is a slight reform of the Stock Exchange.

THE REAL CONSPIRACY.

President Roosevelt is much disturbed by the machinations of the corporations. For some time he has seen in every effort to check or thwart him the cunning hand of capital. His troubles at Panama have been due to the plots of the railways; the criticism of his course in regard to the negro soldiers at Brownsville is, he is confident, inspired by the Trusts. Last week Wednesday he capped the climax by telling the assembled newspaper correspondents that there was a widespread conspiracy against him and his beneficent policies. Harriman and Rockefeller have struck hands with Hearst in an effort to control the next Republican and Democratic National Conventions, to the end that a reactionary, some man hostile to President Roosevelt's theory of regulating great corporations, may succeed him and undo his good work. His words recall that familiar hymn:

> Christian! dost thou see them
> On the holy ground,
> How the troops of Midian
> Prowl and prowl around?

And the President echoed the triumphant chorus, "Christian! up and smite them!" From this time forth he would give these enemies of righteousness no quarter. "My spear," he said, "knows no brother."

The fury of President Roosevelt presents puzzling features. Provoked by a report, afterward contradicted, that E. H. Harriman had asserted that whenever he wanted legislation from a State Legislature he could buy it; that he "could buy Congress," and that if necessary he "could buy the judiciary," Mr. Roosevelt denounced Harriman in the roundest terms for "cynicism and deep-seated corruption." Moreover, "the man uttering such sentiments and boasting, no matter how falsely, of this power to perform such crimes," was "at least as undesirable a citizen as Debs or Moyer or Haywood." The President was "horrified, as was Root." That horror we share to the full; but we cannot understand the suddenness of the President's moral awakening, or, for that matter, of Secretary Root's. Both of them have been Republican leaders for more than two decades. By this time they should have learned what the Republican party is and what its cardinal doctrine of protection implies. The Republican victories in Presidential elections, in Congressional elections, and often in State elections, have for years been due to the fact that "wealthy corruptionists"—to use President Roosevelt's own phrase—"could buy Congress." They could and did buy Congress. They paid the money to the treasurers of Republican campaign funds and got in return the tariffs on steel, wool, and a thousand other commodities. The transaction was not secret; it was open and shameless. Long before the late Senator Hanna became a power in the party, the Republican leaders had "fried the fat" out of those manufacturers who benefited by the tariff. This system of fat-frying Senator Hanna developed and perfected; and as a result Theodore Roosevelt became Vice-President of the United States.

In the campaign of 1904 the fat was again fried with energy and success by Mr. Cortelyou and Cornelius N. Bliss; and, according to Harriman's tale, he himself was fried to the tune of $50,000. The President, however, avers that a gift from the Tobacco Trust was refused because the Government was suing the company; and that at any rate no contributions could alter his policies one jot. This scrupulosity we cannot praise too warmly. Yet we wonder what reason he and his counsellors offer for the thousands of dollars paid to Mr. Cortelyou and Bliss in 1904, by corporations and wealthy corruptionists. Was it uncontrollable admiration of Theodore Roosevelt that loosened these tight pocket-strings? If so, what has changed this frantic love into hatred? No grown man needs to be told that the money was contributed for the election of Mr. Roosevelt under an obligation expressed or implied. Senator Thomas C. Platt, whose specialty is not resounding professions of virtue, frankly admitted that when he accepted $10,000 from each of the three big insurance companies he was morally bound to protect their interests. And when the Republican committees accepted $50,000 from Harriman and similar sums from other wealthy corruptionists, the Republicans gave a spoken or tacit pledge to make an adequate return. Otherwise, the transaction cannot be rationally explained. What is more, the Republicans fulfilled at least part of the bargain. They have not touched the tariff. The beneficiaries of the iniquitous Dingley law passed their money across the counter, and President Roosevelt, Senator Aldrich, and Speaker Cannon delivered the goods.

Now as to Mr. Roosevelt's fear that he may be succeeded by some one less hostile to corruptionists, some one, for example, who would find it "a real pleasure" to see Mr. Harriman, we hazard a prediction: the fear is groundless. In the last two or three years many events have combined to inspire the rank and file of our voters with a wholesome dread of the influence of corporations in politics; and among these events none is more significant than the publication of the letters of Harriman and Roosevelt. This has been a sickening revelation. We do not refer to Harriman's alleged boast that he could buy State Legislatures and Congress. That view, as we have already noted, he and his kind have always held. The shocking thing is to find the people's idol, the clean, the high-minded Roosevelt, our loudest preacher of private and public chastity, begging this corrupt Harriman to come to the White House, imploring him to help out in the New York State campaign. If Roosevelt will stoop to this, we may well be alarmed by the effect of money and corporations on men of softer ethical fibre, our political molly-coddles.

We believe, however, that people have made up their minds to some radical changes. Our citizens have done their best to remove from the reach of greedy politicians the huge surpluses of insurance companies. Various Legislatures are preparing more drastic rules for publicity and honest management of all public-service corporations. Across this dial the shadow will not move backward. The next step should be to attack the very citadel of our political corruption—the protective tariff. So long as it remains what it is, the tone of public life will be sordid; and Congress and Legislatures, judges and Presidents, will be bought and sold like stocks on the Exchange.

FREAK LEGISLATION.

The English press has apparently taken too seriously the proposal of a New Jersey legislator to have a license tax levied upon human whiskers. Even the humorous comments are of the kind that are made by the irreverent on sober projects, not those which merely sustain and enforce what was a joke in the first place. This is not a unique instance. Correspondents of English and Continental newspapers are continually cabling bits of news of the same kind about the work of our Legislatures. A rural legislator in Arkansas introduces some preposterous bill. It is the only feature of what may have been a serious and profitable session that gets the slightest mention abroad. No wonder that European leader-writers comment gravely on the fantastic laws which the light-minded Americans propose to enact. Yet the gibes of our friends across the water have point in this respect. Many "freak bills" are introduced every year by Senators and Assemblymen who have been honored with the confidence of their constituencies and have solemnly sworn to preserve the institutions of their commonwealths. Why, then, should any legislator deliberately propose something which only creates amusement at the expense of himself, his State, and even, as in the case of the whiskers bill, his country?

It is a question for the psychologist quite as much as the publicist. The first reason is that some men's minds work freakishly. The crotchets and mental twists that are reflected here are no different from those we find among our neighbors in private life. What shocks and surprises is their appearance in

high places and under such dignified auspices.

Another thing to be remembered is that in the legislator familiarity has bred contempt for the mere formalities of law-making. To him, "be it enacted" is a natural and flexible means of expression. Suppose an idea, noble, whimsical, or satirical, comes into his mind. If he were a poet he would embody it in verse, if an artist in a cartoon, if a journalist in a paragraph. But, being merely the gentleman from the Eleventh, he gives the same idea substance in the form of a printed and numbered bill. Perhaps he is even encouraged by the fact that he will get his name into the newspapers and the benefit of free advertising. He may also secure repute as a humorist. It is an old and effective Parliamentary device to defeat a bill by loading it with ridiculous amendments, as when the bill establishing the whipping post for wife-beaters in the District of Columbia was made to carry an appropriation for a thumb-screw and a ducking-stool. The same principle is carried a little farther by the drafting of bills for, so to speak, rhetorical purposes. But, looked at in one way, this is no more a profanation of a sacred place than when in Rome the statue of Mars was used as a bill-board for the first pasquinades.

Because a bill, *per se*, is not so grave a matter to one who lives among bills as to an outsider, legislators have a pleasant way of introducing other people's bills as a personal favor. In Congress they add the line "(by request)" as a disclaimer of responsibility. There is no cause so crazy that its advocates cannot point to some House or Senate bill which embodies their ideas. Sometimes, critics or opponents try to call to account the introducer himself. Several years ago, for instance, a Brooklyn Congressman got into endless trouble through a long bill, embodying a complete reorganizatien of every branch of the government and the creation of dozens of new departments, like "Public Fluids" and "Public Amusements." He had introduced it unread, to oblige an ultra-radical acquaintance, yet on the stump he had to reply to countless insinuations about his own sanity, based upon the visionary measure.

The freak bill is often the expression of a widely held belief. Thus thousands of citizens may personally abominate whiskers, without becoming supporters of the New Jersey regulation bill. They may desire all their friends to marry, without advocating such a bill as came before the Missouri Legislature this very winter, to tax all bachelors between twenty-one and sixty one-tenth of their earnings. We cannot, in fact, read a catalogue of measures called by the opprobrious term without realizing how many of them embody what we ourselves might like to see enforced. "A man ought to go to jail for that," we say at some petty annoyance. "There ought to be a law" against this, that, and the other thing. Well, the freak legislator has the courage of such convictions. A few years ago in Minnesota he was attacking the false measure and the deceptive strawberry box by seeking to have all fruits and vegetables sold by the pound. In Utah he was proposing a penal statute requiring house-cleanings. This year he is in Iowa trying to have every marketable egg stamped with the date when it was laid. He is in Missouri trying to prohibit "treating" by a bill so drastic that, as it is pointed out, "a young man could not buy his sweetheart ice cream" if it became law. In Minnesota he would make it a misdemeanor for a farmer not to practise rotation of crops. These are good objects, but it is the consensus of opinion that it is better not to make a crime of everything in which we do not believe.

From these we pass to a class of bills which really have nothing funny about them, but sound as if they had. Many inspection bills are of this class. When a member drew a bill to give the State of Illinois a "beer inspector," there was a howl of amusement all over the State. The real beer inspector would presumably be a lean old chemist; but he was pictured as a rotund inebriate, disciplined for neglect of duty whenever discovered sober at his office. A bee inspection bill in Missouri was ridiculed, though it meant much to the honey producers; and the bill creating the office of State Entomologist was laughed to death merely by christening it the "bug bill." Bills against the carrying of concealed weapons are supported by the best people in the South, but they sound humorous because they are locally called "pistol-toting" bills. Not long ago it was thought a great joke that the Canadian Parliament was asked to legislate for the protection of whales. This was a measure of import to two great industries, yet people simply refused to take a whale seriously.

The freak bill, after all, is both harmless and well-intentioned. Paradoxically, it is the legislative "joker" which makes the serious trouble.

THE COLONIAL CONFERENCE.

That the gathering of the Colonial Premiers in London will mean much for English politics, as well as for the larger interests of the Empire, evidence is accumulating to show. The question of trade preference is thrust forward by the *Standard*, which declares that, if the Conference as a whole declines to discuss the matter seriously, the delegates from the Colonies will flock by themselves to decide upon a programme. This, of course, is conceived of as a shrewd move in behalf of the Conservative party. Yet Balfour was in power at the time of the Conference of 1902, but could do nothing to promote preferential trading within the Empire. Chamberlain's scheme of food-taxes was afterwards offered as a basis for such trading, but was so decisively voted down in the last general election as to make any bargaining on those terms wholly impossible to-day. This even Lord Milner admits, though he calls it "a disastrous accident of party warfare" which has brought about that state of affairs.

One of the ablest and most powerful of the Colonial Premiers has shown, in advance, that the Conference cannot be expected to do anything practically to further preferential trade relations within the Empire. Sir Wilfrid Laurier, in the last speech which he made in the Canadian House of Commons, before sailing for England, put the case in a way that really leaves nothing more to be said. He stated frankly that he would like to see "a universal system of free trade between all the parts that compose the British Empire." But that is impossible at the present time. "It suits us in this country," said Sir Wilfrid, "to be tinged with protection more than perhaps I should like to have us tinged. It does not suit the British people to be tinged the same way." Colonial governments are compelled to raise revenue by means of tariffs. Yet they had made an offer of preferential trade, and were ready to go further if the British Government were prepared to reciprocate. But "this policy has not met with favor in Great Britain," the Canadian Premier said. He added:

> Well, we would not accept the idea that the British public should force upon us their own fiscal views, and no more would they tolerate the idea that we should force upon them our fiscal views, and therefore the only way in which the British Empire can be maintained upon its present foundation is by allowing every nation composing it the measure of liberty that it has, and also a free choice of the fiscal policy which it is to maintain.

After that, we need nothing more to show how absurd is the *Standard's* notion of the Colonial Premiers going outside the Conference to force the hand of Campbell-Bannerman. The trade question will, no doubt, be largely debated. Winston Churchill has said that it will be "most freely open to the Colonial Premiers to put their case with all the force of argument they can command." Yet everybody understands that the verdict of the English electorate last year must stand as a fixed fact, to be accepted by all members of the Conference. There cannot now be a tax on wheat or beef or mutton, with an exemption for the Colonies, in return for their lowering of duties on British goods; and without such a tax the proposals of the Australians and Canadians necessarily fall to the ground. It has, indeed, been sug-

gested that something could be done, not by levying new taxes, but by reducing old ones. Tea and coffee, sugar, dried fruits, cocoa, tobacco, and wines all pay duty in England now, and all are produced within the British Empire. Hence it has been proposed that colonial preference might be given by lowering the rates on those imports. But that would be, in the first place, a serious impairment of the British revenue, and would, besides, affect so small a part of colonial exports as to be a concession which would scarcely seem worth while. It is, therefore, the settled belief of all concerned that the Conference of 1907 will have no better success than that of 1902 in taking practical steps to promote preferential trade within the Empire.

There are, however, other important topics to be brought before the Conference. One of them is Imperial defence. In this matter, the demand is made, not by the Colonies, but upon them. Why should they not contribute to the military expense involved in the undertaking by Great Britain to defend them with her navy? But here, again, the Imperialists run against great obstacles. The Colonies have but little money to spend on armaments, and that little they desire to retain within their own control. They sent troops to South Africa during the Boer war. But even in the act of dispatching them, the Premier of Canada said he hoped that they would help win "a victory which would take away from the Dutch population none of the rights which they enjoyed to-day," and would display the British Empire as "deriving its strength from the most complete local autonomy." It is upon this rock of colonial pride and self-sufficiency that all the schemes of unified control of the military resources of the entire Empire have hitherto broken, and bid fair to break. Lord Milner, himself, very high priest of Imperialism that he is, admits in his *National Review* article that this is a matter which cannot be driven. The "true principle," he writes, is to "encourage the Colonies to develop their own forces," so as to cooperate with the power of the Empire, and with each other.

If the outlook for tariffs and armaments is thus poor, more may be done with the proposal for an Imperial Council. Even this, in its extreme form, would be offensive to the Colonies. When the Tory Colonial Secretary, Mr. Lyttelton, formulated in 1905 a plan for such a Council, the comment of the Canadian Government was that it would "interfere with the workings of responsible government." Nothing overbearing or arbitrary would be tolerated by the Colonies, we may rest assured. Yet there is room for some sort of body visibly representing Imperial unity. Call it Imperial Council, or call it Colonial Intelligence Department, it might easily serve a useful function in diffusing information and strengthening confidence. The smaller its power to command, the greater might be the effect of its suggestions and advice. Along this line, in fact, the Conference will be likely to reach its most important results. It will be the first one held under Liberal auspices. The Liberal colonial policy has been reproached as favoring a "loose confederation," instead of a well-knit Empire; but it may well be that the Ministry of Campbell-Bannerman, by insisting upon Imperial unity arrived at through local freedom, with diversity, may really do more to bind the Empire together than all the proud plans of the Conservatives, gone wrong.

ENGLISH AS SHE IS LEARNED.

Three instructors in English at Harvard, C. N. Greenough, F. W. C. Hersey, and C. R. Nutter, fortified by "several years' experience in reading English entrance examination books," have prepared a "Report on the Examinations in English for Admission to Harvard College." Their purpose is to point out the most frequent errors, with the hope that both teachers and pupils may lay the lesson to heart. The pamphlet, issued by the Publication Office at the price of 15 cents, contains much that should interest not merely educators, but parents and all other students of the adolescent mind.

The Harvard Catalogue contains the distinct warning that "no candidate will be accepted in English whose work is seriously faulty in spelling, grammar, punctuation, or division into paragraphs." Yet singular verbs with plural subjects, pronouns gone astray, and even sentences without any verbs at all are extremely common. Here are a few from many gems:

Then follows various scenes.

Addison wrote a description of his travels which were freely criticised.

Even an uneducated person without reading any comments but just depending on the play as they read it would brand both as the highest type of gentlemen.

The child who just able to creep was attracted by the fire within whose glow reflected on the snow through the open door.

Macbeth's bravery is seen in the way he defeated the Danes. And again when we hear Duncan compare Macbeth to Bellona's bridegroom. Then too in the respect which the other characters hold him.

The boys who wrote these sentences obviously knew nothing about grammar. The high-school teacher, according to the authors of the pamphlet, feels that he should take instruction on this subject for granted; but if he "does not spend a considerable part of the first year in reviewing, supplementing, and enforcing the instruction already given in the grammar schools," he "may be sure that much of his more advanced instruction will be misspent." From this fact the Harvard instructors draw no inference—at least for publication; but if their generalization is sound—and it is confirmed by our own observation—the teaching of grammar is badly done in a vast number of schools. Some of our experts in pedagogy have discarded as too hard and dry the rigorous old drill in parsing by which children learned at least that a sentence *must* contain a subject and a predicate. We have substituted various fancy and easy "language lessons," "exercises in diagramming," and what not. As a result, school work is more entertaining; but in grammar, children come out complete ignoramuses. A reaction against the modern method has set in, and it will, we trust, spread.

Spelling is another weak point; but apparently our golden lads and girls do not find their chief difficulty with the words which bother Mr. Carnegie and his advisers. Out of a list of 120 words often misspelled by candidates for Harvard, not half-a-dozen have been simplified by the Spelling Board. Below are some of the words which have been starred as particularly troublesome:

cheif	independant	prejudice
decission	infinate	privelage
differant	insistant	proffession
discribe	interlectual	recieve
dissapeared	lead (for led)	rythum
dissapoint	litterary	sentance
exagerate	noticable	seperate
finaly	phamplet	supprise
godess	posess	villian
grammer		

An examination of these words makes it clear that pupils need severer training, both of eye and ear. People misspell because they do not know exactly what a word looks like or how it sounds. Written exercises tend to correct one form of error; oral, the other. Mr. Greenough and his collaborators urge that when children read aloud teachers "must insist that pupils give to each syllable its proper value." This is excellent advice, but if Henry James's censure of slovenly pronunciation, even among educated persons, be justified, the ideal is at present unattainable.

The pamphlet contains many amusing instances of sentences, paragraphs, and whole compositions that violate every conceivable principle of rhetorical construction. Unity, mass, and coherence die the death in each line. The mistakes on which we have dwelt hitherto are not such as to provoke despair, but for the boys who wrote as follows we cannot entertain much hope:

Godfrey Cass was called away from a nice time where his loved Nancy was together with the doctor by Silas Marner who had found Godfrey's daughter in his home instead of his gold.

In the causes that Shylock gives for hating Antonio, just before lending the money if all he said was true, some of the things that Antonio did was not quite like a gentleman, although he may have been provoked to such an extent that no human being could have contained himself.

These examples indicate, we fear, something like a "brainstorm"; they are not merely clumsy writing, they are confused thinking. Mr. Greenough speaks of a candidate who "wrote each sentence without knowing the direction which the next one was to take." The words in the sentences just quoted are put down in the same higgledy-piggledy fashion. There is no beginning, middle, or end. Mr. Greenough would secure "logical coördination" by means of "careful prevision." This is sound counsel; but we wish he would go further and tell us how to persuade some boys of our acquaintance to previse their work at all, to say nothing of doing it carefully.

These faults of grammar, spelling, and rhetoric are often accompanied by a staggering inaccuracy as to facts. The drudgery of reading examination papers should be much relieved by such purple patches as these.

Gareth was the youngest son of King Lot and Queen Belladonna.

Pope as a dramatist in his *Cato* is not as good as Marvell in *Dr. Faustus*.

I like Shakespeare very well, and have read most of his Waverley Novels.

Addison's first work was a poem in which he compared Wellington to the Gaurdian Angle, hecause of his ode on the Battle of Blenheim.

We should like to reprint in full the account of Addison's student days at Harvard College, but we must pass on to a masterpiece of inconsequence on Addison's life "up to the time when he began to write the *Spectator*":

In Addeson's early life he was a great scholar, and wrote Latin poetry. He was a very smart man, but was easily emharrassed. He was a whig. Being a very able man, the Whig party when they came in Power sent Addeson to france to study french. He stayed abrode ahout three years, visiting Italy, Germany, Endland. While traverling in Italy, it is supposed that he conceived the Idea to put the play of Cato upon the stage. At this period the plays were very smutty, and Addeson greatly improved them.

Addeson when talking with his friends could speak eloquently but when he once tried to make a speech in Parliment, he was unable to say one word.

Pope and Addeson were great friends, hut they had a falling out, on account of Popes jealously. They never hecame intimate friends again while they lived.

The causes of inaccuracy and illogical arrangement are many. One of them is that the schooboy cares little about Addison or Pope. Neither their careers nor their writings appeal to him strongly; and he is wholly indifferent as to the details of their achievements and their quarrels. But here we enter upon the question of teaching literature and the choice of books for the young. This is another subject.

MRS. GASKELL.

I.

It was an unusual fate that called upon the editor of the *Cornhill Magazine*, within a period of a few months, to supply the missing conclusions of two such novels as "Denis Duval" and "Wives and Daughters." The last number of Thackeray's half-told story, with its *cetera valde desiderantur*, appeared in the issue of June, 1864; in the same magazine for January, 1866, Mrs. Gaskell's long contrihution came to an ahrupt end, fortunately all hut finished when her busy hand was suddenly stopped. "We are saying nothing now of the merely intellectual qualities displayed in these later works," wrote Frederick Greenwood in his notice of Mrs. Gaskell; "twenty years to come, that may he thought the more important question." Well, just twice twenty years were to elapse before the Master of Peterhouse was to answer that question so happily in the Introductions to her complete works.* He has left not a great deal for the critical gleaner to say. There is, in fact, nothing recondite in either the heauties or the limitations of Mrs. Gaskell's genius, and my desire is merely to invite others to the pleasure these well-edited hooks have given me. We have all of us read "Cranford," and some of us "Wives and Daughters"; but how many of the younger generation are familiar with the pathos of "Ruth"; or the deeper pity of the lahor tales, "Mary Barton" and "North and South"; or the mingled satire and regret of "My Lady Ludlow"? How many are familiar with her riper work—with that humble tragedy of the sea and the moors, "Sylvia's Lovers"; or that flawless, radiant idyl, "Cousin Phillis"? And to these must he added the long series of short stories whose names almost had heen forgotten.

There are, as may be seen from this list, two main sources of inspiration in Mrs. Gaskell's writing, the lahor trouhles of the cities and the sequestered peace of the country, corresponding to the divisions of her own life. She was horn in London, in 1810, her father, William Stevenson, being a man of some intellectual distinction. But her mother died within a month after the child's birth, and the little Elizaheth grew up with her maternal relatives in Knutsford, a village of Cheshire lying some twelve miles south of Manchester. Her home here was the house of Mrs. Lumb, her mother's sister; hut she must have seen a good deal of her uncle, Peter Holland, the physician of the town, who is supposed to have furnished the model for Mr. Harrison and for Mr. Gihson of "Wives and Daughters." Her grandfather, Samuel Holland, was a gentleman farmer living at Sandle Bridge, two or three miles distant. Here she drew in part her pictures for the Woodley of "Cranford" and for Hope Farm of "Cousin Phillis." "The aspect of the country was quiet and pastoral," she writes of that famous visit of the Cranford ladies to Mr. Holhrook's, which must have been like so many of her own excursions to Grandfather Holland's. "Woodley stood among fields; and there was an old-fashioned garden where roses and currant-hushes touched each other, and where the feathery asparagus formed a pretty hackground to the pinks and gilly-flowers; there was no drive up to the door. We got out at a little gate, and walked up a straight hox-edged path." But the land was not without its heroic traditions. The great Clive had gone to school at Knutsford, was perhaps connected with the Holland family (his mother was a Gaskell), and had certainly spent some of his holidays at Sandle Bridge, where he had displayed his youthful prowess, and alarmed his hosts, hy jumping from the round hall of one gate-post to the other. When Mrs. Gaskell came to describe her Hope Farm, she did not forget that famous entrance to her grandfather's place.

II.

Such was the serene setting of her early life; to her maturer years came a serenity of another sort. In her twenty-second year she was married in the parish church at Knutsford to the Rev. William Gaskell, joint minister of the Unitarian chapel in Cross Street, Manchester. Mr. Gaskell was a man of large attainments and refinement, who for several years held the post of professor of English history and literature in Manchester New College. Their home, at No. 84 Plymouth Grove, hecame a centre of cultivated interests in a community more concerned with the laws of trade than with the canons of taste. But there was no shirking of the more painful realities. As a minister's wife, the poverty and rehellion of those years must have knocked at her doors, and she was not afraid also to face them in their haunts. In particular she saw a good deal of the working people in the company of her friend, Susanna Winkworth, had attended their dehates and visited their homes, and knew their grievances and errors. And so, in a season of affliction, she sought naturally to lose her personal grief in this sympathy with the poor. She had already written one or two hriefer pieces when, after the death of her infant son, she hegan her first lahor story, "Mary Barton." This was written in the years 1845-47, and puhlished in 1848—significant dates. Her other lahor story, "North and South," was written as a serial for Dickens's *Household Words*, in 1854-55, and then issued as a complete work. The material was ready to her hand, and, indeed, no one of Mrs. Gaskell's sensitiveness could have lived in the heart of manufacturing England during the "hungry forties" without reflecting the trouhle of the times.

All during that half century, while the wealth of the country was piling up, there had been recurring periods of extreme depression for the laboring classes. The chief cause of the evil in Mrs. Gaskell's day was the rapid change in economic conditions due to the newly invented methods of manufacture. But the hitterness of the suffering was magnified hy two opposite circumstances. Despite the distress inflicted by them on the city poor, the Corn Laws, until a revolution threatened, were kept in force by the great land-owners who perceived their wealth and power transferring to the manufacturing class and naturally resented the change. On the other hand the new doctrine of laissez-faire, which hegan to gov-

*"The Works of Mrs. Gaskell." In eight volumes, Knutsford edition. With a General Biographical Introduction, and a Critical Introduction to Each Volume, by Dr. A. W. Ward, who has received the kind assistance of the Misses Gaskell. New York: G. P. Putnam's Sons. 1906.

ern the manufacturing world, was not without its answering evil. To strip men of all their faculties save those productive commercially, to make cash payment, as Carlyle inveighed, the universal sole nexus of man to man, to find in supply-and-demand a sufficient substitute for duty and mercy—what better name could be given to this than the "dismal science"? The reaction from that heartless trust in *let-alone* is felt to-day in the humanitarian palterings with the laws of retributive justice and in the excesses of socialism. In Mrs. Gaskell's day hostility to the system could be traced up and down the country in riot and misery, in sullen plottings, and vociferous appeals to Parliament.

III.

And fiction has corresponded to these different conditions. In a word the elder novelists undertook to awaken a sense of obligation and pity in the strong toward the weak; whereas too often to-day the purpose of the reforming writer is to preach a millennium of brotherly love to be achieved through inflaming the hatred of the poor against the rich. There were exceptions then, of course, as there are now. Rumblings of the purely Jacobin clamor were still heard, as in the imprecations of the Corn Law Rhymer:

> Avenge the plunder'd poor, oh Lord!
> But not with fire, but not with sword,
> Not as at Peterloo they died,
> Beneath the hoofs of coward pride.
> Avenge our rags, our chains, our sighs,
> The famine in our children's eyes!
> But not with sword—no, not with fire
> Chastise Thou Britain's locustry!
> Lord, let them feel thy heavier ire;
> Whip them, oh Lord! with poverty!
> Then, cold in soul as coffin'd dust,
> Their hearts as tearless, dead, and dry,
> Let them in outraged mercy trust,
> And *find* that mercy they deny!

But even here the cry is for mercy from above. Carlyle was the prophet of revolt against political indifferentism, and his words might be written down as the motto of much of the labor fiction of the day: "'Guide me, govern me! I am mad, and miserable, and cannot govern myself!' Surely of all 'rights of man,' this right of the ignorant man to be guided by the wiser, to be, gently or forcibly, held in the true course by him, is the indisputablest." To Disraeli this right to be governed took the form of an imaginative restoration of the older hierarchy of society. Mrs. Gaskell looked for relief rather to the more feminine qualities of the heart. "They'n screwed us down to th' lowest peg, in order to make their great big fortunes, and build their great big houses," cries one of the starving workers, "and we, why we're just clemming, many and many of us. Can you say there's nought wrong in this?" And from this *clemming*—"starving," the dreadful word runs like a chorus through both these novels—grows the moral tragedy of the plots. Thus, John Barton kills the son of his employer, Mr. Carson, driving himself into haunted exile and throwing the suspicion of the murder on the lover of his daughter Mary. The scene of reconciliation, when at last Barton comes home broken by remorse, and the enemies meet face to face in his desolate home, may be quoted both as an illustration of Mrs. Gaskell's creed and as a specimen of her earlier dramatic style:

> John himself stood up, stiff and rigid, and replied——
> "Mary, wench! I owe him summut. I will go die, where, and as he wishes me. Thou hast said true, I am standing side by side with Death; and it matters little where I spend the bit of time left of life. That time I must pass wrestling with my soul for a character to take into the other world. I'll go where you see fit, sir. He's innocent," faintly indicating Jem, as he fell back in his chair. . . .
> But as Mr. Carson was on the point of leaving the house with no sign of relenting about him, he was stopped by John Barton, who had risen once more from his chair, and stood supporting himself on Jem, while he spoke.
> "Sir, one word! My hairs are gray with suffering, and yours with years"——
> "And have I had no suffering?" asked Mr. Carson, as if appealing for sympathy, even to the murderer of his child.
> And the murderer of his child answered to the appeal, and groaned in spirit over the anguish he had caused.
> "Have I had no inward suffering to blanch these hairs? Have I not toiled and struggled even to these years with hopes in my heart that all centred in my boy? I did not speak of them, but were they not there? I seemed hard and cold; and so I might be to others, but not to him! —who shall ever imagine the love I bore him? Even he never dreamed how my heart leapt up at the sound of his footstep, and how precious he was to his poor old father. And he is gone—killed—out of the hearing of all loving words—out of my sight for ever. He was my sunshine, and now it is night! Oh, my God! comfort me, comfort me!" cried the old man aloud.
> The eyes of John Barton grew dim with tears. Rich and poor, masters and men, were then brothers in the deep suffering of the heart; for was not this the very anguish he had felt for little Tom, in years so long gone by that they seemed like another life?
> The mourner before him was no longer the employer, a being of another race, eternally placed in antagonistic attitude, . . . no longer the enemy, the oppressor, but a very poor and desolate old man.

And so the chastened master of men, now but a man himself, goes out to ponder on the causes of suffering and hatred, and becomes in his own way a reformer. His new desire was "that a perfect understanding, and complete confidence and love, might exist between masters and men; . . . and to have them bound to their employers by ties of respect and affection, not by mere money bargains alone; in short, to acknowledge the Spirit of Christ as the regulating law between both parties."—How strangely old-fashioned the phrases sound; how far we have removed our theories from that simple trust! Turn from Mrs. Gaskell to the bleak skepticism of Gissing's "Nether World" or the chapters of "Life's Morning" that run parallel in theme with "Mary Barton"; or compare the doctrine of class consciousness so diligently proclaimed by some of our living American novelists—and how different the world we are in. What novelist to-day would dare to indulge in a sentimental outcry to the rich, like that of Dickens in "The Old Curiosity Shop" to "those who rule the destinies of nations!" Whether economically or not, the artistic advantage was certainly with our elders. Through their appeal and warning we seem to hear, in tones confused it may be by the perplexities of long experience and by much half-knowledge, the cry of the Greek stage, *Alas, oh generations of men!* and of all great literature, and the reader is softened and broadened by association with the ancient pity of human life. Our modern fiction of the Zola-Tolstoy school may be more effective, though even this is doubtful, in immediate reform, but to the reader it brings only a harsh contraction of spirit, and its end is in hatred and revolution and palsy and decay.

IV.

But the didactic purpose is not unpleasantly prominent in these tales. Mrs. Gaskell wrote, not because she had a lesson to inculcate, but because her heart was moved by the blind suffering about her and her mind absorbed by the problem of these contending characters. Nor is the color of the stories one of unrelieved darkness; especially in "North and South," which opens with the pretty idyl at Helstone, in the New Forest, "like a village in a poem — in one of Tennyson's poems," made up of "the church and a few houses near it on the green—cottages, rather—with roses growing all over them." And when the heroine is transplanted from this southern home to the grime and stress of a great northern factory town, there is the contrast of two civilizations, meeting and contending for her soul—the old ideal of leisurely manners and the modern of stripped efficiency. And Margaret Hale herself is one of the heroines of fiction we cherish as we cherish the memory of women known in our youth. As has been said by another, we can almost see her, as poor Bessy saw her in a dream, "coming swiftly towards me, wi' yo'r hair blown back wi' the very swiftness o' the motion, a little standing off like; and the white, shining dress on yo've getteu to wear." In one respect, like the other heroines of Mrs. Gaskell's books, she is sketched with a touch less feminine than masculine. They are all creatures of passion, yet we feel that their choice in love is not so much personal and voluntary as the result of that life-force which beats through the world, and of which they are the passive instruments. They are like vessels charged with a subtle and dangerous fluid; and this, I take it, is rather man's way of contemplating women. And when, as it does in "Sylvia's Lovers," this unregarding force takes for its vehicle a girl made up of little vanities, what can the consequence be but a life broken by the clashing of its own strength and weakness—perhaps in the end a pathetic self-abnegation? One feels this union of traits at the first glimpse of Sylvia as she comes down from her hill-home to the sea-town —in her childlike delight at the thought of buying a new cloak, in the nimble vitality of her body. She was wilful, as such women are, but she was to learn many things—to learn the nature of the forces that played upon her. "It's not in me to forgive; I sometimes think it's not in me to forget," she exclaims; and again: "I'm sick o' men and their cruel, deceitful ways."

And with this portrayal of passion there goes an entire chastity of language—the *pudor* of true art which would represent the beauty and the devastating attraction of this force without evoking the corresponding physical emotion in the reader or beholder. I happened to be reading "Eugénie Grandet" at the same time with

"Sylvia's Lovers," and I was struck by a difference in this respect. Eugénie is a noble example of the pure heroine whose passive nature is possessed by the blind force; she is of the large, still type, more like Phillis and Ruth than Sylvia, but akin to them all in destiny. There is in Balzac's portrayal of her beauty a freshness and chastity not common in his books, or, indeed, appropriate to most of his women; yet even here he forgets himself and must insinuate how she would have appealed to the Parisian roué. It is a fault in art, for in the crowded impressions that come from reading such a description the brain fails to distinguish between what is ascribed to the woman herself and what is said about her. Richardson, for example, learned this lesson of delicacy in the interval between "Pamela" and "Clarissa Harlowe"; parts of the first work are nasty, though written with the best intentions, whereas I cannot recall in all the similar situations of "Clarissa" a single scene that produces a physical disquiet. Now in this point the purity of Mrs. Gaskell's own mind was a safeguard against error. Read the pages where Philip watches his Sylvia at the spinning wheel, or where Kinraid observes her knitting, and again at her household work, moving "out of light into shade, out of shadow into the broad firelight"—the nature of her attraction is made sufficiently clear, but there is never a disturbing suggestion.

V.

The scene of "Sylvia's Lovers" is a Yorkshire whaling village, where the bleak moors roll down to the coast. Always the sound of water is in the air, the sound of "the waves lapping against the shelving shore," the lights and murmurs of the sea of Aphrodite, though under a gray northern sky. But for the first of her idyls she turned to her own home in the quiet country just bordering on Lancashire, and it is well known that "Cranford" is an idealized, or etherealized rather, picture of Knutsford. Of the book there is no need to say anything. It was published next after "Mary Barton," and could scarcely have been written without the experience that gives force to the earlier novel. For, if we analyze the charm of "Cranford," it will be found to depend largely, I think, on a feeling of unreality, or, more precisely, of proximity to the greater realities of Manchester. This contrast was a part of Mrs. Gaskell's own life; she made use of it deliberately in "North and South," and it gives their peculiar tone to the idyllic tales, as may be seen clearly enough by comparing her country with Jane Austen's. What impresses one in Miss Austen's books is a feeling of stability; governments may fall in London, but any change in the manners and occupations of this provincial folk is inconceivable. In "Cranford" just the contrary is true. Here the grace is of something that has survived into an alien age, and is about to vanish away; there is a tremulous fragility in its beauty.

"Cranford" is flawless in a way, but not more so than "Cousin Phillis," while its colors are altogether paler. Indeed, one scarcely knows how to praise the gem-like beauty of the later pastoral without using language that might seem to place it too high as a literary work. "A Protestant clergyman is perhaps the finest subject for a modern idyl that can he found," wrote Goethe of "The Vicar of Wakefield," and the words are even more applicable to Mrs. Gaskell's minister Holman. "He appears, like Melchizedec, to combine the characters of priest and king. Devoted to agriculture, the most innocent of all terrestrial conditions of man, he is almost always engaged in the same occupations, and confined to the circle of his family connections. He is a father, a master, and a cultivator; and by the union of these characters, a true member of society. On these worldly but pure and noble foundations his higher vocations rest." There could be no better comment on the meeting with Phillis and her father, the farmer-preacher:

"Well, my lass, this is Cousin Manning, I suppose. Wait a minute, young man, and I'll put on my coat, and give you a decorous and formal welcome. But—— Ned Hall, there ought to be a water-furrow across this land; it's a nasty, stiff, clayey, dauby bit of ground, and thou and I must fall to, come next Monday—I beg your pardon, Cousin Manning—and there's old Jem's cottage wants a bit of thatch; you can do that job to-morrow, while I am busy." Then, suddenly changing the tone of his deep voice to an odd suggestion of chapels and preachers, he added, "Now I will give out the psalm: 'Come all harmonious tongues,' to be sung to 'Mount Ephraim' tune."

He lifted his spade in his hand, and began to beat time with it; the two laborers seemed to know both words and music, though I did not; and so did Phillis; her rich voice followed her father's, as he set the time; and the men came in with more uncertainty, but still harmoniously. Phillis looked at me once or twice, with a little surprise at my silence; but I did not know the words. There we five stood, bareheaded, excepting Phillis, in the tawny stubble-field, from which all the shocks of corn had not yet been carried—a dark wood on one side, where the wood-pigeons were cooing; blue distance, seen through the ash-trees, on the other. Somehow, I think that, if I had known the words, and could have sung, my throat would have been choked up by the feeling of the unaccustomed scene.

The hymn was ended, and the men had drawn off, before I could stir. I saw the minister beginning to put on his coat, and looking at me with friendly inspection in his gaze, before I could rouse myself.

It is a rare scene, whose dignity verges on the humorous, and which only a writer conscious of her art would have dared venture upon. It strikes the keynote of the book, but for completion there is needed that picture of Phillis in the first flush of her love for "Cousin Manning's" friend, standing under the budding branches of the gray trees, and whistling with the birds in unconscious delight. It is a fact of pathetic significance that cousin Phillis did not know the meaning of her joy, but should understand so well the reason of her sorrow when the turn came.

In the end one is tempted to ask why this pastoral tale has failed to establish itself among our classics. One compares it, perhaps, with "The Vicar of Wakefield"; one tests the scene of Minister Holman in the fields with that of Parson Primrose drinking tea with his family where his "predecessor had made a seat, overshadowed by a hedge of hawthorne and honeysuckle." Why is it that the later book, with all its overtones of beauty and sentiment, does not rank with its plainer rival? We are more deeply stirred by the events of "Cousin Phillis" than by that of "The Vicar," yet we feel that a hundred years from now Goldsmith's work will be read with the same kind of interest as to-day, when Mrs. Gaskell's shall be all but forgotten. May it not be just the emotional qualities of "Cousin Phillis" which prompts one to give it so brief a period of life? Somehow the sentimental appeal has a dull trick of losing its effect in an astonishingly short time, as any one can discover by reading the chapters of Miss Burney's "Cecilia," over which Mrs. Gaskell's parents, no doubt, like others of their generation, shed copious tears; whereas Goldsmith's just mixture of satire and sentiment, his freedom from superfluous baggage, his eighteenth-century cleanness of style, have the preservative quality of Attic salt.

But these are idle surmises. It is enough that the radiant beauty of "Cousin Phillis" and the fuller charms of "Wives and Daughters" are still contemporaneous to us, and that we can now enjoy them in their excellent new dress. P. E. M.

THE AMERICAN ORIENTAL SOCIETY.

PHILADELPHIA, Pa., April 6.

The American Oriental Society has just held its one hundred and nineteenth meeting in Philadelphia, where courtesies were extended by the American Philosophical Society and the local Oriental Club. Then, too, the Historical Society, which was holding its annual reunion, invited the Oriental Society to join in its evening festivities. The sessions were well attended, and the number of papers presented, fifty in all, would have proved embarrassingly large, had not some of them been read by title only. Of the fifty, twenty-two had to do with Aryan civilization in the East and (by an odd chance) exactly the same number with Semitic subjects, the six remaining papers dealing with the Philippines, Borneo, Egypt, and the American gypsies.

Of the first group, the initial paper was a study of the Rig Veda. There have been many ways of attacking the problem of the comparative age of the different parts of this Veda; and since the problem is as yet by no means settled, every new method is welcomed by Sanskrit students. In this paper the point of attack was the fact that verse-lines and stanzas are repeated throughout the Veda. The bearing of such repetitions upon the age of the eighth book was considered by Prof. Maurice Bloomfield of Johns Hopkins, whose deductions seem to support the view that the book in question is not very early. In the latest contribution to this subject, published in the society's *Journal* several years ago, Prof. E. Washburn Hopkins of Yale took the same view, on the basis of a similar comparison of phrases found thus repeated and of the vocabulary of the eighth book. The long-expected completion of the Vedic concordance has now made easy the then formidable task of reviewing all such parallels; and though the result remains the same, it has additional support in the new examples added by Professor Bloomfield. Other Vedic papers of interest were offered by C. J. Ogden, who came to the same conclusion, on the basis of Sāyana's treatment of the subjunctive, that this commentator's judgment was not of much importance in

the matter; by S. G. Olyphant, who presented a study of the Vedic dual; and by Mr. Welden, who interpreted jihva purogavī in Rv. 10.137.7 as an instrumental, a decidedly clever suggestion.

Of more general character was the sketch of the rise and fall of some of the late Nayaka kingdoms in southern India, presented by the Rev. Mr. Chandler of Madura. The same gentleman offered a striking paper on the life of the early Jesuit missionaries, whose success appears to have been in direct ratio to their tact and capacity for adapting themselves to the social prejudices of their new converts. One of the most successful of these devoted followers of Xavier, Robert de Nobili, even permitted his converts to retain caste, and by so doing he won over thousands, though the attitude of his successors made havoc of his gains at a later date. This enlightened Christian first of all prepared himself for his work by becoming a Hindu. "If," said he, "God could become man to save the world, surely I may become a native of the people I would save." Modern missionaries, instead of trying to destroy the social position of the converts they make, might learn a lesson from one of the few men who have made an impression on India.

Prof. L. H. Mills on the Avestan side sent from Oxford a paper on the influence of the Ahuna Vairya doctrine upon the Christian dogma of the Logos. This was read by title, but it will appear in the society's publications. The influence of the Avestan calendar upon the names of the Persian and Armenian months formed the subject of an interesting communication by Dr. L. H. Gray, while Prof. A. V. W. Jackson of Columbia gave in abstract notes on the history of India and on Merv.

In the special session devoted to comparative religion, the chief paper was that of Prof. Morris Jastrow of the University of Pennsylvania, who gave a masterly discussion of the science of divination in Babylonia based on the interpretation of the liver. Difficult texts hitherto unintelligible have become clear through understanding how essential was the liver as a means of divination. No less important is the historical light thrown on the connection between Babylon and the West. Liver divination in the Etruscan cult seems to be connected directly with that of the Semitic East, and in both the basis of the extraordinary regard paid to the liver is not only its conspicuous markings, but also the belief, based upon the bloody appearance of that organ (perhaps, too, on the relation between health and a sound digestion), that the liver was the seat of the life and of the soul. Prof. A. T. Clay of the University of Pennsylvania announced a discovery in regard to a divine title extant in the names of endorsers of Aramaic business documents, which seems to be of some importance in rehabilitating a figure of the pantheon otherwise nearly obliterated; but it would not be fair to the author of the paper to anticipate its publication. At the same session Miss Margaretta Morris reviewed the various cases of connection between magic and morals to be found in Borneo, where, as elsewhere, morality, if not occasioned by magic (in which term Miss Morris included tabu) is at least fostered and conditioned by it; an old theme, but beautifully illustrated by the new examples presented in this instructive paper.

Out of the wealth of other papers offered, limitations of space will permit of but few being mentioned, but among the few must appear one of the two contributions of Prof. J. D. Prince of Columbia in regard to the Romany jargon of America. A very large proportion of Gypsy vocabulary still smacks of India whence it came. Considering that the Gypsies have been in Europe for six hundred years or more this is a remarkable showing. It is possible only to refer to Prof. C. Johnston's collection of more or less *intime* letters in cuneiform and his remarks on the postal service of Babylon; on Prof. C. R. Lanman's account of the "Buddhist Way of Purity," written by Buddhaghosa, the contemporary of St. Augustine; and Prof. Paul Haupt's ascription of Semitic origin to the word *cabinet;* while other papers deserving more than a reference must be omitted altogether from this cursory survey.

At the annual change of presidents Prof. C. H. Toy of Harvard was succeeded by Prof. Lanman, also of Harvard. Professor Toy himself, on retiring from office at the first session, delivered an address on the work done in Oriental languages during the last year. Prof. C. C. Torrey of Yale resigned as Semitic editor, after seven years of exacting work, and Prof. L. B. Paton of Hartford was chosen in his place. A feature of this meeting was the earnest appeal made by the officers for funds to carry on the proper work of the Society, which for more than sixty years has been the scientific representative of Oriental work in this country. The society adjourned on Friday afternoon, to meet again on April 23, 1908, at Cambridge, Mass.

NEWS FOR BIBLIOPHILES.

F. W. Bourdillon's extended account of the early editions of that popular book of the Middle Ages the "Roman de la Rose," which has recently been sent out to members of the Bibliographical Society, is an admirable piece of modern bibliographical research. For the first time the correct sequence of the twenty-one editions printed before 1539 has been determined. As they are in large part undated, and in many cases without name of printer or publisher, this has been a difficult task, necessitating minute study and comparison of copies. But no one who looks carefully into the matter can doubt the correctness of Mr. Bourdillon's conclusions. Just which was actually the first edition of the work has long been an open and much discussed question. The first seven editions, all in folio, are undated. Brunet described three of these, all with forty-one lines to a full page; but he was unwilling to express an opinion as to priority. The one first named by him has until recently been generally regarded as the earliest. It is, however, actually the third. The fourth edition mentioned by him, and briefly described from an imperfect copy containing 177 leaves (instead of 180), with thirty-four lines to a full page, is now known to be actually the first. It was printed at Lyons by Ortuin and Schenck about 1481. This determination of place and printer was first made known by M. Claudin in his "Histoire de l'Imprimerie," but Mr. Bourdillon has found proofs from the illustrations, from transposed lines of text, and from misprints, which seem to fix the precise status of this and the later editions beyond all doubt. His presentation of these proofs is a fine example of bibliographical reasoning. The first part of the "Roman de la Rose" seems to have been written about 1237 by Guillaume de Lorris, who died leaving a poem of about four thousand lines. About forty years afterwards another young poet, Jean de Meun, added a second part, nearly twenty thousand lines; and in its completed form for more than two hundred and fifty years the work enjoyed a vast popularity. The manuscript copies alone, mostly prepared before the invention of printing, number, according to Mr. Bourdillon, several hundred, scattered among the great libraries of the world. The popularity of the story waned, however, in the early years of the sixteenth century; and after the edition of 1538 no other appeared until 1735.

Two other publications of the Society issued as of 1906 though actually distributed during 1907 are "Abstracts from the Wills and Testamentary Documents of Binders, Printers, and Stationers of Oxford from 1493 to 1638," by Strickland Gibson; and "Alien Members of the Book-Trade during the Tudor Period," compiled by Ernest James Worman. These two books contain information which has been heretofore practically inaccessible, and will serve, with other publications of the Society, as parts of the groundwork for a history of printing and publishing in England.

On April 15 the Anderson Auction Company of this city will sell a miscellaneous collection. The most important lot is a curious scrap-book of portraits, autograph letters, original drawings, etc., brought together by the English actor, Richard John Smith, 1786-1856, who was generally known as "O. Smith." On April 16 Anderson will sell a collection, mainly from the library of William H. Browne, containing some interesting items of Americana. Among them are Harris's "Collection of Voyages," 2 vols., folio, 1744; Rogers's "Concise Account of North America," 1765; Esquemeling's "Bucaniers of America," 1684; books on André; and a long series of Lincoln orations and addresses. Two privately printed works relating to Col. Samuel B. Webb appear in the auction room, apparently for the first time; his "Correspondence and Journals," collected and edited by Worthington Chauncey Ford, 3 vols., thick small quarto, 1893, in an edition of 350 copies; the "Reminiscences," by J. Watson Webb, 1882, "published exclusively for family circulation," the number printed being undoubtedly small.

Sotheby, Wilkinson & Hodge of London will sell at auction on April 18, 19, and 20 some of the rare books and manuscripts of Sir Henry St. John Mildmay of Dogmersfield. There are several fine illuminated French Books of Hours, rare pieces of Americana, and books from the early English presses. Among the last mentioned are two Caxtons: a fine and nearly perfect copy of Gower's "Confessio Amantis," 1483, first edition; and an imperfect copy of the third and last Caxton edition of the "Legenda Aurea," 1493. Wynkyn de Worde's

press is represented by "Vitæ Patrum," 1495; "Dives and Pauper," 1496; and "Chronicle of St. Albans," 1497. There are all four of the Shakespeare folios, but the first and third are imperfect. The First Folio seems to have the genuine title, trimmed and mounted; but it lacks the leaf of Ben Jonson's verses and three other preliminary leaves. The Second Folio is sound and genuine, and has the rare imprint of Richard Meighen. The Third Folio lacks the dedication and several of the preliminary leaves are in poor condition. The great rarity in the sale, however, is a copy of Shakespeare's "Sonnets," 1609, the rare first edition, of which no copy seems to have been sold since 1874, when Sir William Tite's copy was acquired by the late Frederick Locker-Lampson for the low price of £15. The title and dedication of that copy were in facsimile by Harris. The Mildmay copy, which is not included in Sidney Lee's "Census," is perfect, that is, no leaves are lacking; but the headline and even the first line of text are cut from a number of leaves. It is inlaid throughout in writing paper. Another rare Shakespeare item is a copy of "The Troublesome Reign of John, King of England," 1622, the third quarto. Other important books in the sale are: Spenser's "Faerie Queene," 1590-96; Coryat's "Crudities," 1611; Burton's "Anatomy of Melancholy," 1621; Langland's "Piers Plowman," 1550; and Allot's "England's Parnassus," 1600. In May, Sotheby will offer one of the finest known copies of the First Folio in private hands. It is only a little shorter than the Rowfant copy, which recently brought £3,600. The fly-leaf and title are mounted, and two leaves are repaired. About 1660 this copy came into possession of Col. John Lane of Bentley Hall, Staffordshire. When the Lane library was sold in 1856 the third Earl of Gosford bought this Folio for 157 guineas. The fourth Earl sold it for £470. It is now No. 19 in Sidney Lee's "Census." At this sale, in May, Sotheby will also offer copies of the other three folios. The Third Folio is the Langham copy, with the additional title, 1663. It brought £435 in 1894.

Full reports on the Van Antwerp sale in London March 22 and 23, show, as usual, that some items brought very good prices, while others fell off from previous records. The most notable decline was in the Shakespeare quartos. The following are examples: "A Midsumer Nights Dream," Roberts, 1600, £180; "Henry the Fift," 1608, £82; "King Lear," 1608, £200; "Sir John Falstaffe and the Merry Wives of Windsor," 1619, £120; "Romeo and Juliet," 1637, £30. These are all much below the high records made at sales a little more than a year ago. Prices on other important lots are: Allot's "England's Parnassus," 1600, £40; Arnold's "London Chronicle," about 1503, first edition, £85; Malory's "King Arthur," Thomas East's edition, n. d., £277 17s. 6d.; Barbour's Life of Bruce, lacking title, but said to have been printed at Edinburgh, about 1571, £121; Beaumont and Fletcher's "Comedies and Tragedies," 1647, first folio edition, £34; Bunyan's "Pilgrim's Progress," the first edition of the Second Part, £80 (this cost Mr. Van Antwerp $175); Bunyan's "Holy War," 1682, very fine copy, £100; Butler's "Hudibras," the three parts, first editions in original sheep binding, £65; Chaucer's "Workes," 1542, a very large copy, £40; Coryat's "Crudities," 1611, £40; Defoe's "Robinson Crusoe" (the word "apply" in the Preface spelled correctly), with the "Farther Adventures," 1719, £160; Drant's "Two Bookes of Horace, his Satyrs," 1566 (with two leaves of errata, said to be unique), £33; Dryden's "Absalom and Achitophel," 1681, with the Second Part, by Tate, 1682, £20 15s.; Esquemeling's "Bucaniers of America," with the fourth part, 1684, £25; "Cato's Moral Distichs," printed by B. Franklin, 1735, £92 (this was the identical copy which brought $410 in the Proud sale, 1903, but since rebound); "Cato Major," Franklin, 1744, £62 (this copy sold at Anderson's in 1905 for $390); Goldsmith's "Traveller," 1764 (only one other copy is known), £216; "The Traveller," 1765, £30; "She Stoops to Conquer," 1773, earliest issue, in the original paper cover, uncut, £90; Gray's "Elegy," 1751, £205 (this was the McKee copy, which sold at Anderson's in 1902 for $740); Herrick's "Hesperides," 1648, £76; Heywood's "An Hundred Epigrammes," 1550 (the only copy known), £126; Holinshed's "Chronicles," 1577, £50; Keats's "Poems," 1817, presentation copy, £90 (this identical copy brought $500 in the Arnold sale, 1901); Marston's "Malcontent," uncut, £70; Milton's "Masque Presented at Ludlow Castle" (the first edition of "Comus"), 1637, a poor copy, £162; "Paradise Regained," 1671, uncut, £94; "The Thrie tailes of the Thrie Priests of Peblis," Edinburgh, 1603 (only one other copy known, and that imperfect), £120; Pope's "Windsor Forest," 1713, uncut, £48; Purchas's "Pilgrimes," 1624-26, £170; Smith's "Generall Historie of Virginia," 1624, £90; Spenser's "Faerie Queene," 1590-96, £86.

At an auction at Hodgson's, London, the latter part of March, Ruskin's "Poems," 1850, the first collective edition, brought £42; the *Germ*, original issue, four parts, bound in one volume, £24; the original drawings by "Phiz" for the trial scene in "Pickwick," £50; the manuscript of Thackeray on George II., written out by C. Pearman, with corrections throughout by Thackeray, £81; Milton's "Paradise Regained," first edition, uncut, £92; Purchas's "Pilgrimes," 5 vols., 1625-26, £49.

The autographs of John D. Crimmins of this city, sold by the Anderson Auction Company on Monday, brought more than $11,000. The complete set of signatures of signers of the Declaration of Independence went for $2,850; two letters of Robert Burns, $265 and $380; a letter from Daniel Boone to Gov. Isaac Shelby, $120; a letter of Henry Clay, in 1837, discussing the Senate, $1,150; a letter of Thomas Jefferson, 1814, inveighing against slavery, $230; Gen. Richard Montgomery's letter to Gen. Sir Guy Carleton, written before the assault on Quebec, in which Montgomery was killed, $750; Washington's plan for attacking the British in New York, written and signed by the general, $825.

The death is announced from Vienna of Arthur L. Jellinek, author of a number of bibliographical works. He was born in 1876. Among his books are "Internationale Bibliographie der Kunstwissenschaft," "Bibliographie der Vergleichenden Literatur-geschichte," "Bibliographie von Goethe," and "Literarische Bibliographie von Theatergeschichte."

Correspondence.

WILLIAM HENRY DRUMMOND.

To the Editor of The Nation:

Sir: It is difficult to find words to express the loss, suffered by those who knew him, in the death of William Henry Drummond. To the world at large, Dr. Drummond was the creator of a new type in literature; to his friends he was infinitely more than this. Warm-hearted, generous, sympathetic, true as steel, he stood for all that is best in the land of his birth, and in the land of his forefathers. Patriotic in no narrow sense of the term, he took a keen interest in all public questions, and threw his influence on the side of all movements for the betterment of Canadian life. He had faith in the wholesomeness of Canadian ideals, and believed firmly that his country was destined to take a large place in the world's history. He was a broad man in every sense of the term. His modesty would not admit anything of merit in his own achievements, whether in literature or otherwise; but he always felt and expressed the warmest appreciation of what was worthy in the work of his friends and contemporaries.

Like that other well-known Canadian, "Ralph Connor," Dr. Drummond was literally forced to publish his first book by friends, who would not permit him to hide his talents. His earlier Habitant verses were written solely for the amusement of a few intimates, and when the suggestion was made to him that he should issue them in book form, he scouted the idea as absurd. The instant popularity which "The Habitant" achieved in Canada and England, and especially in the United States, left him almost aghast. And yet it was part of the charming simplicity of his character that he accepted the praise lavished upon his book without either affectation or self-consciousness. He was genuinely pleased to find that thousands of readers on both sides of the Atlantic shared his own keen interest in the personality of the French-Canadian peasant, though he did not realize that his own genius had made the type known to the world; even to those of us who lived among the Habitants, Dr. Drummond's word-pictures came as a revelation. Clothed in that extraordinary patois, so amazing to those who have not come in contact with the Habitant, and yet so familiar to any one who has travelled in the Province of Quebec, his verses reflect, with inimitable humor, sympathy and delicacy, the essential characteristics of the type. The rural population of French Canada is unlike that of any other country. The Habitant is the result of peculiar conditions. Transplanted originally from the north of France, the stock has been modified and transformed by the environment of the new world. It retains the simplicity and poetic temperament of the old stock, combined with a measure of the vigor and self-reliance of pioneer life. And with it all the Habitant remains to this day almost untouched by the influences of modern civilization, living his life in his own sufficient way, oblivious of many things that the rest of us think indispensable. It is this odd product of Old and New France that Dr. Drummond, from the abundance of his

knowledge, drew with such unerring skill and perfect sympathy.

It is important, too, that his attitude toward his subject should be made clear. It has occasionally been objected, by educated French-Canadians and others, that Dr. Drummond's Habitant poems from their very form were designed to ridicule the class they described. The warmly appreciative introduction of Dr. Louis Frechette (the truest poet that French Canada has produced, and than whom no man is better qualified to speak on this subject) to "The Habitant" is a sufficient answer to any such objection. Dr. Drummond himself explained his reason for adopting the patois of the French-Canadian peasant in the preface to his first book of verse:

> Having lived practically all my life side by side with the French-Canadian people, I have grown to admire and love them, and I have felt that while many of the English-speaking public know perhaps as well as myself the French-Canadian of the cities, they have had little opportunity of becoming acquainted with the habitant. Therefore I have endeavored to paint a few types, and in doing this it has seemed to me that I could best attain the object in view by having my friends tell their own tales in their own way, as they would relate them to English-speaking auditors not conversant with the French tongue.

In his latest book, "The Voyageur," there is a poem called "The Last Portage" that possesses a peculiar appeal now that the man who wrote it has, in the very prime of his life, been called on by the inexorable captain to traverse himself the last portage. The verses were written while Dr. Drummond was suffering keenly from the loss of his little son, and they show that the patois of the French-Canadian may lend itself to something deeper than humor:

> Off in front of me as I go,
> Light as a dreef of de fallin' snow—
> Who is dat leetle boy dancin' dere'
> Can see hees w'ite dress an' curly hair,
> An' almos' touch heem, so near to me
> In an' out dere among the tree?
>
> . . . . .
>
> An' oh! mon Dieu! w'en he turn hees head
> I'm seein' de face of ma boy is dead—
> Dead wit' de young blood in hees vein—
> An' dere he's comin' wance more again
> Wit' de curly hair, an' dark-blue eye,
> So lak de blue of de summer sky—
>
> An' now no more for de road I care,
> An' slippery log lyin' ev'ryw'ere—
> De swamp on de valley, de mountain, too,
> But climb it jus' as I use to do—
> Don't stop on the road, for I need no res'
> So long as I see de leetle w'ite dress.
>
> An' I foller it on, an' wance in a w'ile
> He turn again wit' de baby smile,
> An' say, "Dear fader, I'm here you see,
> We're bote togeder, jus' you an' me—
> Very dark to you, but to me it's light,
> De road we travel so far to-night.

Dr. Drummond has crossed the last portage, but he has left behind as a legacy three books not unworthy to be classed with what is true in the world's literature; and he has left to those that knew him the memory of one who was a worthy citizen, an honorable and upright man, and the best and stanchest of friends.

LAWRENCE J. BURPEE.

Ottawa, April 8.

Dr. William Henry Drummond died on Saturday from the effects of a stroke of paralysis. He was born in Ireland in 1854, but came to the Province of Quebec while still a young boy. He was educated at the English High School and at McGill University in Montreal. He then studied medicine; and, after practising his profession in a village of mixed population, he became professor of medical jurisprudence in Bishop's University. The titles of his volumes are "The Habitant," "Phil-o-rum's Canoe," "Johnny Courteau," and "The Voyageur."

COLLEGE COURSES IN PUBLIC SPEAKING

TO THE EDITOR OF THE NATION:

SIR: Not long ago the awkward boy who survived the ordeal of "speaking his piece" before the district school committee had completed his course of instruction in public speaking. Even if he went to college, he got nothing more. "Speaking pieces" was the one form of public address known to higher education. Twenty years ago the entire training in at least one New England college consisted of the recitation of "Spartacus to the Gladiators." Each little tin man, when sufficiently wound up, went through the performance automatically, jerking out his gestures at the appointed spots with the precision of a Christmas toy on a street corner. Then, after exhibiting to a long-suffering commencement audience the power thus developed, the finished product of this course in "Elocution" went forth to astound the world with his eloquence. And the world was astounded!

Indeed, the world was so astounded with all the fantastic tricks that came to be performed in the name of "elocution" that the word fell into ill-repute. Many institutions dropped the name; some dropped the thing also; a few tried to substitute something sensible. In the last ten years the new subject which has found its way into the largest number of colleges as a regular course is debating. When properly conducted, this course recognizes the fact that the only sound basis of effective public speaking is vigorous thinking—a thing about as foreign to the genius of the old elocutionist as to the modern stenographer, fresh from a two months' course. Debating, at first berated as an old-fashioned amusement, has swiftly proved its worth. Many believe that there is no course in the whole college curriculum of greater inherent educational value. What it may yield, however, depends in a peculiar degree on the power of the instructor, for as a college course it has no traditions, no generally accepted methods, no definite body of material. It may be a farce not to be tolerated anywhere, or it may be the fitting culmination of the whole college course, using the knowledge and the power gained in all other studies for the scientific investigation and effective presentation of the truth.

The formal joint-debate, invaluable as it is under the firm and mature guidance of Prof. G. P. Baker at Harvard, is yet only one form of debating, and debating is but one highly specialized form of public address. The fixed rules, the time limit, the number of persons on each side, the give and take of rebuttal, make a formal debate a kind of game—an intensely interesting game, a game exacting all the powers of the whole man, but, nevertheless a game—the play rather than the business of life. The student debater finds in that dim future after commencement, when he becomes marked as an educated citizen in his community, that other forms of public address are demanded of him on numerous special occasions.

Accordingly the newer college courses in public speaking deal with the eulogy, the after-dinner speech, the Memorial Day address, and various other commemorative and occasional addresses. The study of masterpieces is followed by the writing of addresses. These are sometimes delivered before the class, but unless they are delivered before the audience for which they are prepared, they must lack one essential of effective speaking—adaptation to the time, the place, and the people. To secure this, the student is urged to imagine a definite audience and a special occasion, and persuasively to adjust his thought to the intelligence, moods, and prejudices of this audience at this time. But still the work is academic. Instructors who have tried this plan say that not one student in a hundred is equal to the problem. And no wonder! The work is never brought to the final test, indeed the only true test, which is and must be the definite audience and the special occasion.

A course in public speaking offers no adequate incentive to hard work, develops no genuine enthusiasm, until it adopts the laboratory method. A course in science now brings its laboratory to the college, but a course in public speaking must go out to find its laboratory, which is the public platform. There is no more connection between the old elocution and practical public speaking than there is between the old text-book study of chemistry and the work of the dye-house. At Bowdoin College each student in the most advanced course is brought to this ultimate test—the special audience. This means, not the commencement audience of indulgent friends who smilingly accept conventional wordiness, while the speaker abuses his privilege of being commonplace, but heterogeneous social settlement groups, Memorial Day audiences, extension lecture clubs, grange meetings, city Christian associations, churches, high schools and academies, lumber camps and town meetings, party caucuses and political rallies.

This work is elective only for men who have shown proficiency in the underlying courses in English composition, voice-training, argumentation, and debate. Every address is prepared for the special occasion under the direction and criticism of the instructor. The course ends with a banquet at which every man gives an after-dinner speech. Last year every speech had a touch of humor and a definite object; it came to the point directly, emphasized it briefly, and then—O rarest of joys—it stopped. The record on the college books is the record of the student's success in attacking these perfectly definite problems. That the speakers did not fail last year is indicated by the fact that every coöperating institution has applied this year for another student-speaker. For the twenty men in this course forty special addresses have been arranged to be delivered outside the college during the next two months.

The effect on the students is striking. Note the renewed ambition when the student of medicine takes his first case under the direction of the house physician. Observe the new lease of life for the student of architecture when he sets to work

on the first plan which is actually to meet its ultimate test in the hands of the builder. The same fresh stimulus comes to the student of public speaking when he advances from the artificial exercises of the classroom into the real world. He may find in this personal problem his first incentive to do a piece of work just as well as he can do it; he begins to see that public speaking which has more than momentary effect must be based on vigorous thinking; and his attitude in the classroom changes from passive receptivity to eager solicitude for instructiou and criticism.

WILLIAM TRUFANT FOSTER.

Bowdoin College, Brunswick, Me., March 28.

LONGFELLOW'S "BIRDS OF KILLINGWORTH."

TO THE EDITOR OF THE NATION:

SIR: The Longfellow centenary reminds me of an interesting letter which I received from the venerable poet a quarter of a century ago. I was then, as now, interested in the protection of birds and, indeed, of all innocent life. In lecturing and writing on the subject I frequently referred to the beautiful story of the "Birds of Killingworth," which forms one of the delightful "Tales of a Wayside Inn." The question was sometimes raised as to whether this narrative had any basis of fact or was merely the fantasy of a poetic brain. In Longfellow's verse we read that the farmers of Killingworth, annoyed by the thefts of the birds who claimed a share of the crops, decided upon their extermination. At the town meeting the only advocate for the "winged wardens" of the field was the schoolmaster, who urged that what the feathered marauders carried off was only a fair payment for their exertions against insect foes of agriculture. The farmers, with the nnwisdom of "practical men," scorned the plea for compassion, and "doomed with dreadful words to swift destruction the whole race of birds." The result of the slaughter was a plague of insects which made Killingworth "a desert without leaf or shade." The farmers were wiser than some people, for they were willing to be taught by experience, and in the spring that followed the blight

A wagon overarched with evergreen,
Upon whose bonghs were wicker cages hung,
All full of singing birds came down the street,
Filling the air with mnsic wild and sweet.

From all the country ronnd these birds were bronght,
By order of the town, with anxious quest,
AED, loosened from their wicker prisons, sought
In woods and fields the places they loved best,
Singing loud canticles, which many thought
Were satires to the authorities addressed,
While others, listening in green lanes, averred
Snch lovely music never had been heard!

Longfellow with a poet's skill mingles his plea for the birds with a pretty love-story of the schoolmaster and the "fair Almira," who shares his humanitarian sentiments.

Was it fact or fiction—this story of the slaughter of the birds being followed by a dire plague of insects? The poet sent the following letter, which, beside putting the matter in its true light, is interesting as showing his sympathy with those who deprecate the senseless slaughter that goes on daily of so many bright and beautiful creatures:

Portland, July 11, 1881.

Dear Sir:

Your letter has been forwarded to me at this place, and I am glad to give you the information you desire, in regard to the "Birds of Killingworth."

The poem is founded on fact. Killingworth is a farming town, on Long Island Sound, in the State of Connecticut.

Some years ago there was an animated debate in the State Legislature, and the birds were doomed, as stated in the poem.

Of course, the details of the poem are my own invention, but it has substantial foundation of fact.

I sincerely sympathize with you in your exertions on behalf of the birds. In Elihu Burritt's "Foot Excursion from London to Land's End" there is a beautiful description of the place of a gentleman in Cornwall, who was a great friend and protector of birds. I think it would please you to read it.—I am, dear Sir, yours very truly, HENRY W. LONGFELLOW.

Please excuse me not writing with my own hand; my eyes are a little out of order.

The information given in the poet's letter is more explicit than that contained in the note to the "Riverside Edition," which must now be regarded as the definitive and authoritative issue of the poet's works. The editors say:

Killingworth in Connecticut was named from the English town Kenilworth in Warwickshire, and had the same orthography in early records. Sixty or seventy years ago, according to Sir Henry Hull, writing from persoual recollections, "the men of the Northern part did yearly in the Spring choose two leaders, and then the two sides were formed; the side that got beaten should pay the bills. Their special game was the hawk, the owl, the crow, the blackbird, and any other bird supposed to be mischievous to the corn. Some years each would bring them in by the bushel. This was followed up for only a few years, for birds began to grow scarce." The story based upon some such slight suggestion was Mr. Longfellow's own invention (vol. vi., pp. 262-263).

The passage in Burritt's book to which Longfellow directs attention is a notable one; in it the "Learned Blacksmith" describes a visit he made in company with John Harris, the "Miner Poet," to the home of the "Bird-Friend of Tregedna." This landowner was a lover of trees and birds. Avoiding the use of either snares or cages, he had won the confidence and companionship of the birds. "He has proved by the happiest illustration," says Burritt, "that any one with the law of kindness in his heart, on his tongue, and in his hand, may have the most intimate fellowship of these sweet singers, and their best songs from morning till night, without the help of snares or cages." Mr. Fox would call the birds to their breakfast by a whistle, "and they would come out of the thick, green leaves of the grove and patter, twitter, and flutter around and over his feet." The Bird-Friend of Tregedna was the uncle of that charming Quakeress, Caroline Fox.

As the postscript indicates, Longfellow's letter is written by an amanuensis, but the signature is in the well-known and characteristic handwriting of the poet. The letter was written in July, while he was on a visit to his native place. He returned to Cambridge, Massachusetts, where the greater part of his life had been spent, and in the following March America had to lament, by his death, the loss of a leader in literature, a man whose purity of spirit is reflected in his verse, and whose words have been an inspiration to many and in many lands. WILLIAM E. A. AXON.

Southport, England.

A SUGGESTED MEANING FOR "BELIE."

TO THE EDITOR OF THE NATION:

SIR: I wish to suggest a new meaning, or rather an old meaning, for the word "belie" in that passage of Shakespeare which in the Folio reads as follows:

What shall I need to draw my sword? the paper
Hath cut her throat already. No, 'tis slander,
Whose edge is sharper than the sword, whose tongue
Outvenoms all the worms of Nile, whose breath
Rides on the posting winds, and doth belie
All corners of the world. Kings, Queens, and states,
Maids, matrons; nay, the secrets of the grave
This viperous slander enters.
—Cymbeline, III. iv., 38.

The traditional sense that is given for the word in this passage is: "to fill with lies," this interpretatiou having, apparently, been first offered by Johnson, and taken from him by the other dictionaries as follows:

In Johnson (1755): To fill with lies. This seems to be its meaning here:

'Tis slander . . . whose breath
Rides on the posting winds, and doth belie
All corners of the world.

In Webster (1828): To fill with lies.

Slander doth belie all corners of the world.
—Shak.

In "Century Dictionary" (1889): To fill with lies.

'Tis slander, whose breath
Rides on the posting winds, and doth belie
All corners of the world. —Shak.

In "Oxford English Dictionary" (1887): To fill with lies. Obs. Rare.

To avoid this forced sense of the word Vaughan changed the Folio punctuation to make the passage read as follows:

What shall I ueed to draw my sword? The paper
Hath cut her throat already. No, 'tis slander,
Whose edge is sharper than the sword, whose tongue
Outvenoms all the worms of Nile, whose breath
Rides on the posting winds, and doth belie—
All corners of the world—kiugs, queens, and states,
Maids, matrons; nay, the secrets of the grave,
This viperous slauder enters.

Vaughan paraphrases this as follows:

Whose language is borne on the fleet winds, and, at every corner of the world, belies kings, queens, and persons of highest dignity, and both maid and matron: nay, this viperous slander wounds even the dead.

Dowden, in his edition (published since 1902) adopts the punctuation and meaning of Vaughan (mentioning this fact in a footnote); but takes no uotice of the older traditional interpretation of the word.

I query whether the real meaning of the word "belie" in this passage in Shakespeare is not, "to encompass, surround, or beleaguer." The "Oxford English Dictionary" gives another word "belie" from Old English *be-liegan*, defining it as follows: "To lie around, encompass. Specif., to lie with an army round, to beleaguer." If we take Shakespeare's word "belie" in this sense, the Folio reading makes perfect sense; indeed, it seems to me far better sense, than the proposed interpretation of Vaughan. Murray's citations under "belie" come down as late as 1627, and one of them from Lydgate is as follows:

1430 Lydg. Chron. Troy III. xxiv. Dimmed with skyes roule . . . with tempest all be-layne.

Here the context is such as to fit very well with the figurative use of the same word by Shakespeare, who might be paraphrased as saying: "The breath of slander belies the whole world like a tempest." It is extraordinary, however, that this sense should not have been proposed, at least, before, especially since the word "belie" with this meaning is given also in the "Century Dictionary" as follows: "To lie around; encompass; especially, to lie around, as an army; beleaguer."

The aptness of the sense which I propose is so apparent that I believe it is certainly the one intended by Shakespeare, notwithstanding the fact that Shakespearean critics have not (so far as I know) proposed it.

F. STURGES ALLEN.

Springfield, Mass., April 2.

CLOSING THE READING ROOM OF THE BRITISH MUSEUM.

TO THE EDITOR OF THE NATION:

SIR. A notice was posted a few days ago in the British Museum, to the effect that, for purpose of renovation, the reading-room would be closed on April 15. It was *hoped* that it would be reopened on October 31. Word having gone about that there would be very limited accommodation for those who could show just cause why they should have special privileges, I —probably in common with every other reader, past, present, and prospective in London—at once applied by letter and backed up the application in person. On asking whether steps had been taken to notify the American reading public of the curtailment of accommodation in the reading-room, I was told that nothing of the sort has been done. The young gentleman in charge looked extremely unhappy, and said that he realized keenly what this curtailment would mean to many people in the United States, while to the people at the Museum it would mean the buzzing of angry Americans about the office all summer long. He thought possibly the American press would copy the paragraphs on the subject which had appeared in some of the London papers. Possibly they will; but it seems to me worth while to give some more formal notice to the many American students who go to London every summer largely for the purpose of utilizing the facilities for research offered by the British Museum. It is painful to think of all the school teachers, college professors, and writers of every degree, who at this moment are preparing to spend their holidays in London with this end in view.

The special accommodation is very limited, and so many applications have been made already that the space must soon be filled. It would be quite unsafe for any one to come over on the chance of finding accommodation. Those who mean to come should apply at once to the director of the British Museum, giving full particulars about the work they mean to do, its urgency and importance, and stating how many days a week they would need to use the reading-room. Perhaps you will befriend the writing fraternity by calling attention to these facts.

MARIA H. LANSDALE.

Chelsea, London, S. W., March 24.

THE AMERICAN FISHERY QUESTION IN NEWFOUNDLAND.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* has always advocated friendly relations between the United States and the British North American colonies. It was pleasant to notice that you warmly praised the Hon. Elihu Root for his recent statesmanlike and enlightened speeches on the subject during his visit to Canada, and that his views were supported by the whole American press. One must, however, notice that the genial Secretary of State, while enjoying the hospitality of the Dominion, is a very different individual from the same official penning dispatches to the British Government about the fishery question in Newfoundland. All former American ministers from Secretary Marcy's time have instructed their masters of vessels when visiting the British colonies to behave themselves properly and to be specially careful not to violate any of the local laws or regulations. Mr. Root takes quite a different line: he claims for his countrymen that they are not bound to respect the revenue laws of Newfoundland, or to pay light dues, or to respect the colonial fishery regulations.

The authority of Newfoundland in such matters is so obvious that I will not trouble you with any lengthy discussion on the subject. Every civilized Government has the inherent right to protect its revenue from smugglers, and where a common fishery is operated within its control, it has also absolute authority to make regulations to prevent the injury or destruction of such an industry. These rules, I admit, must be just and reasonable, and there must be no discrimination in carrying them out. Our fishery laws are made for one purpose, and one purpose only—to prevent waste and the destruction of the fishery. The action of the combined British and American Governments was to give Gloucester a new privilege—the right to ship natives for the herring fishery—not contained in the convention of Ghent and in opposition to the firm protests of the colonial ministry. How consistent does this kind of conduct appear when contrasted with the secretary's friendly and liberal speeches at Ottawa!

It is a very unpleasant thing to state, but every intelligent man in Newfoundland has come to the conclusion from bitter experience, that no fair treatment of this colony will ever be obtained from the American Government either by reason or argument. Our only weapon is pressure. The results so far of the policy of retaliation are eminently satisfactory to the islanders. The Gloucester fishermen, through want of their usual supply of bait from Newfoundland, have made a wretched voyage. Cod was never so scarce or so dear, and in consequence the islanders have the highest prices for their produce known within the last thirty years. The result has been to put thousands and thousands of dollars in the pockets of the Newfoundlanders and to make every American pay double prices for his fish. The New England deep-sea fishery is an almost moribund, decaying industry, as the figures I give below will clearly show. Every year Gloucester finds it more difficult to get men for the fishery. Voyages are so poor that colonials won't engage with them. As I have shown in former letters, the supply of salt water fish in the States is about one-quarter of the supply in England. British fishermen are flourishing, yours are decaying. It is the veritable *reductio ad absurdum* of protection to tax food and to make the whole American people eat dear fish for the sake of "Lodge's smugglers." In 1895 the retaliation policy began, note the results in the figures given below:

Catch of cod on the Grand and Western Banks (from the Boston Fish Bureau):

	Quintals.		Quintals.
1880	300,990	1883	578,735
1881	355,640	1905	140,040
1882	474,078	1906	142,465

D. W. PROWSE.

St. Johns, Newfoundland, March 19.

Notes.

The *Psychological Review* plans to issue a new series of "Philosophical Monographs" similar to the "Psychological Monographs of the *Psychological Review*" already published. Manuscripts and inquiries should be addressed to Prof. J. Mark Baldwin of Johns Hopkins University.

The University of Chicago Press will soon have ready a book by Camillo von Klenze, professor of German in Brown University, called "The Interpretation of Italy during the Last Two Centuries: a Contribution to the Study of Göethe's 'Italienische Reise.'"

L. C. Page & Co. announce a new edition in leather of C. G. D. Roberts's "New York Nocturnes."

Some time in May the J. B. Lippincott Co. will publish a new Italian romance by Antonio Fogazzaro.

Two new volumes of the Dent-Putnam Classiques Français contain, one "Le Barbier de Séville" and "Le Mariage de Figaro" of Beaumarchais, with a preface by Jules Claretie, the other "Lettres Choisies de Madame de Sévigné," with preface by Charles Boreux. The Beaumarchais seems particularly appropriate in its light form and green-and-gold cover. We observe that the Mme. de Sévigné, though supplied with sufficient notes, is unprovided with any general survey of the persons of Louis XIV.'s court—a serious omission for the ordinary reader.

As soon as the copyright on Alfred de Musset expires, in May, the Société du Mercure de France will publish a selection of his work in its "Collection des plus belles Pages." It will also bring out his "Correspondance," edited by Léon Séché, and including a number of new letters.

Jules Lemaître's study of "Jean Jacques Rousseau" is now published by Calmann Lévy.

"Fireside and Sunshine" is the title of a new volume containing nineteen essays by E. V. Lucas (E. P. Dutton & Co.). Eleven of these essays have been reprinted, sometimes with additions and amendments from Mr. Lucas's "Domesticities," 1900. This writing is in Mr. Lucas's well-known vein—agreeable, vivacious, with bits of interesting observation of men, women, and beasts, and with touches of gentle humor. The matter, however, is rather thin, good enough for a casual contribution to the London *Outlook* or *Country Gentleman*, but

much of it hardly worth preservation in permanent form.

The first volume in the Large Print Library, started by Doubleday, Page & Co., is that story of perennial interest, Emily Brontë's "Wuthering Heights." There is a brief introduction by Jean N. McIlwraith, and a bibliography of the more important books and essays relating to the Bronte sisters. This series is well named, for the type is large and clear, the paper thick and firm. What is more, the price is only 90 cents. The market is flooded with cheap reprints of varying excellence, but in most of them the type is rather small. The present volume is so attractive that we hope the publishers may be encouraged to continue the series.

It is hard to make a flat failure of an outdoor book, but still harder to make it a distinguished success. "Hunting Big Game with Gun and Kodak," by William S. Thomas (G. P. Putnam's Sons), comes some distance from either extreme. Mr. Thomas gives his readers ample variety, hunting the bighorn and grizzly in British Columbia, the caribou and moose in New Brunswick and Quebec, and deer in Virginia and Mexico. Of course he has a camera, in the use of which he hardly appears as an expert, though he has secured some remarkably fine pictures. On his last trip he announces a final revulsion against the deadly gun, and starts for the big game of interior Canada with the camera as his only weapon. That extreme is better than the other, though it is not to be forgotten that the moderate sportsman is generally the most persistent and effective advocate of game protection. Mr. Thomas is not given to the typical hunter's yarn, but one doubts the invariable accuracy of his memory, when he tells of entering a little mining town "in the wee small hours," making all arrangements for starting bright and early in the morning, and then going out to spend the evening in sightseeing, after which diversion a season was spent in getting acquainted with a motley crowd of characters, who had drifted into the barroom in the meanwhile. One wonders what kind of hours people keep there.

"My Life as an Indian," by J. W. Schultz, is made up of a series of articles in *Forest and Stream*, where they appeared under the title of "In the Lodges of the Blackfeet." Bird Grinnell prefaces the little volume by saying: "It is a true history and not romance, yet abounds in romantic incident. In its absolute truthfulness lies its value." This statement we can but endorse, abiding by the assurance given, that it is not fiction. The author is not, like many, ashamed of acknowledging that he is a "squaw man"; and he also shows how unfair it is in many instances to attach to that term condemnation or ridicule. Through the straightforward and unaffected manner in which he pictures his life the reader learns more about the nature of the Indians among whom Mr. Schultz has lived than in the most elaborate scientific treatises. More books of the kind would be useful additions to our Indian literature. Scientific dissections of Indian customs give no adequate idea of the people who practise them, and fiction is mostly written by such as have no practical acquaintance with the subject. Only when one has lived among Indians for long periods and identified himself thoroughly with their mode of thinking, can he portray them with sufficient fidelity. The illustrations are good.

The first number of Vol. XXII. of the Modern Language Association's publications contains a paper on "Jean Paul Friedrich Richter and E. T. A. Hoffmann: A Study in the Relations of Jean Paul to Romanticism," by Robert Herndon Fife. After an Introduction, recalling the charge frequently made by historians and by Richter himself, to the anger of Hoffmann, that Hoffmann had stolen from Richter the best of what he had produced, the author discusses the personal relations and references of the two men, compares Jean Paul's bizarre figures and Hoffmann's Kreisler, and points out several minor motives common to both writers. He also emphasizes their similar irony and shows how Hoffmann caught something of the bombastic style of Richter. Then he comes to the conclusion that, while Goethe, Rousseau, Schiller, and others, besides the Romanticists, may be held responsible for many traits in Hoffmann, "in his youth and early manhood, perhaps until he began his official career at Posen, Jean Paul exercised a considerable influence on Hoffmann, not merely in sentimental moments, but in the formation of his satirical-ironical note as well"; and that this influence continued, now weak, now strong, during the remainder of his life. Other papers in the volume are: "The Sources and Mediæval Versions of the Peace-Fable," by H. Carrington Lancaster; "The Development of John Dryden's Literary Criticism," by William E. Bohn; "Italian Prototypes of the Masque and Dumb Show," by John W. Cunliffe, and "The Sege of Troye," by Nathaniel E. Griffin.

Those who care for out-of-the-way knowledge will be interested in M. Longworth Dames's "Popular Poetry of the Baloches," the Folklore Society's publication for 1905. Balochi, a speech akin to Persian, has never had any literature in the true sense of the word; its poetry has been handed down orally, and, indeed, was not known to exist until 1840, when Lieut. Leech published some specimens in the *Journal of Asiatic Studies* (Bengal). Even then it attracted but little notice, and with one exception there was no further attempt to reduce it to writing until 1875, when M. Dames began the collection printed in this volume. He transcribed and translated a number of ballads and verses, some as old as the sixteenth century, some of the present day in the northern variety of Balochi, *i. e.*, in the language spoken in the country stretching from the Bolan Pass and the Kachh Gandava to the plains on the right bank of the Indus in northern Sindh and the South Punjab. These poems, nearly all of which are intended to be sung, he classifies under the heads of heroic ballads on the wars and settlements of the Baloches, more recent ballads dealing mainly with the wars of tribes now existing, romantic ballads, love songs and lyrics, religious and didactic poems, and lullabies, rhymed riddles, etc. Unlike similar compositions in Afghanistan and Mohammedan India, these show little or no traces of the influence of Persian versification with its artificial arrangement in divans and its pedantic prosody. All the poems, whatever their length, consist simply of a number of lines of uniform quantitative metre with or without rhyme. As in form, so in substance they are simple and direct; the pictures of life and country are faithful and vivid, and the characters of the actors in the different scenes are made to stand out clearly. Along with his own renderings into English, the compiler has printed the texts from which they are made, and by so doing has doubled the value of the work. A limited number of copies may be had of David Nutt, Nos. 57-59 Long Acre, London.

Students of the relations of the Mohammedans of northwestern Africa to the local governments and of the question of the possibility of a Pan-Islamic uprising may be interested in the announcement that a group of young Mussulmans have begun the publication in French of an organ entitled *Le Tunisien*, devoted especially to educational reforms among the native population.

An important contribution to modern history (already announced in our letter from Paris, printed February 28) is "Rome et Napoléon III." (Colin, Paris), by Professor Bourgeois and E. Clermont, with a preface by Gabriel Monod. The thesis is that the Roman question, opened at the very beginning of Louis Napoleon's Presidency, and closed within a few days of Sedan, was the permanent source of weakness in the policy of the Second Empire. M. Clermont deals with the first episode, the expedition of Oudinot, and the mission of Ferdinand de Lesseps in 1849; he has little that is new to offer, and his estimate of the documents he sets out is not weighty. Professor Bourgeois deals far more authoritatively with the later period, which centres about the negotiations of France, Italy, and Austria during the period 1868-70. He is perhaps rather inclined to emphasize the Roman question, and to lose sight of the fact which always dominated Beust's attitude, that the reorganization of the Austrian army could not be completed before 1872. Beust's inner motives are extremely difficult to fathom, and will repay further study. The whole question may also well await the publication of Ollivier's next three volumes, and of the diplomatic correspondence which the French Government has just turned over to be edited by a committee of which Professor Bourgeois is one of the members. A more competent investigator could not have been selected.

The object of Capt. d'Ollone in his "La Chine Novatrice et Guerrière" (Colin: Paris) is to show that the regeneration of China is perhaps not so dangerous to the political equilibrium of the world as it appears at first sight. Taking a broad survey of Chinese history as a whole, and of the developments of the last few years, he concludes that the power of the Manchu dynasty is precarious, and that the death of the Empress Dowager will probably be followed by a dismemberment of the Empire.

One of the private secretaries of Maximilian has published reminiscences of the days of the Empire in Mexico that will deserve a passing notice from students of that phase of history. The work is entitled

"Maximiliano Intimo. El Emperador Maximiliano y su Corte," por José Luis Blasio (Paris and Mexico: Bouret). Many of the personal details which fill its 478 pages are frivolous or impertinent, and some violations of good taste and propriety (as regards the marital life of Maximilian and Carlota) are to be noted. Mingled with the gossip, however, is considerable matter of interest, though nothing of any great historical value that is new.

Lieut. Neushler of the German army has published (Berlin: Mittler & Sohn) a bilingual English and German Military Dictionary. We cannot think that he has fully employed his opportunities, inasmuch as a 16mo volume of some 250 odd pages must of necessity fail to do justice to the richness of the German military vocabulary, and similarly 230 pages is hardly enough for the English-German part. A simple test of a few minutes suffices to show that the book is almost worthless in certain departments. We can, however, honestly praise Capt. Oscar Klincksieck's German-English-French "Technisches und Tägliches Lexikon" (Berlin: Boll und Pickardt), of whose ultimate seventeen parts, nine (pages 1 to 432) lie before us. While addressed chiefly to the needs of officers and officials of the army and of the navy, commercial as well as war, and to the needs indeed of all government functionaries, yet the scope of the work is such that we may fairly assert it to be of general reference. Some idea of its range may be formed from the word *Anker*, for example, which occupies nearly six closely printed pages, as against barely a column (one-third of a page) in Sachs-Villatte. *Bahn* has three and a half pages; apparently every item of railway service falling legitimately under this rubric has been included. Entries under a single head, if numerous, are classified. We note as a defect that the gender, plural, etc., of German words are not indicated; genders are, however, as a rule given in the case of the French equivalents. The dictionary has a wide field of usefulness, part of it virgin.

In a paper read at a recent monthly meeting of the Library Association of England, and now published in the *Library Association Record*, E. A. Baker, librarian of one of the borough libraries of London, and author of "Guide to the Best Fiction," makes the general charge that English municipal libraries not only pander too much to the habit of reading fiction, but that in their supply of fiction their standard is lamentably low. The criticism is based mainly on statistics gathered from twenty-one large libraries in different parts of the kingdom showing the number of books on the shelves by each of thirty-seven authors. For convenience he divides these authors into three groups: the first comprising eleven authors whose works, he asserts, should be in every library; the second including twelve authors whom he designates as "popular mediocrities, only the best of whose books a rate-supported library should buy"; the third comprising fourteen authors whose works he regards as quite below the standard of admissibility to any municipal library. The returns show a total of 2,655 books by authors of the first group, 10,148 by authors of the second, and 5,199 by authors of the third. Coming down to individual authors, Mr. Baker says:

The greatest living English novelist has a total of 390 volumes in these libraries against Miss Braddon's total of 2,296, or an average per library of 19 against her 109; of the greatest French novelist, Balzac, there are 426 volumes in these libraries, while such authors as Mrs. Henry Wood and Miss Worboise are represented by 1,903 and 1,617 respectively.

To the statement that these figures are but a reflection of the public taste, Mr. Baker replies, that this taste has been largely formed by the material given it in the public libraries; and that libraries are not formed to *reflect* public taste, but to *mould* and *guide* it. In this respect, he maintains, the library should occupy the same position as the museum and art gallery. These institutions, he urges, are also "managed for the public good and by the will of the people, but their curators do not fill their cases and adorn their walls with such exhibitions as would create the biggest sensation or draw the largest crowd."

Recent paragraphs and letters from the *Nation* bearing on the "open shelf" problem, are printed in the *Library Journal*, with a brief discussion of the question. The editor takes the ground that, in order to reach a final decision, there should be known, for a considerable number of the leading libraries whose shelves are open, the following facts: The annual losses proportionate to the use and circulation, before access to shelves was granted; the same figures for several successive years after that time; the proportion of the books reported lost at the end of the year that are later found or accounted for; and the proportion of loss from the children's department. Similar figures should be supplied from libraries whose shelves are closed.

The correspondence and memoirs of the late Constantine Petrovitch Pobiedonostseff, formerly procurator general of the Holy Synod, have, according to a St. Petersburg dispatch, been deposited under seal in the Rumiantseff Historical Museum of Moscow. His will directs that they be published at the end of ten years. The papers include extensive correspondence with the last three Emperors, with whom M. Pobiedonostseff was on most intimate terms; letters from many prominent statesmen of the old régime, and a series of letters from the daughter of the poet Tutcheff, one of the court ladies, which, it is reported, will throw intimate light on hitherto obscure court intrigues.

Swinburne celebrated on April 5 his seventieth birthday. According to dispatches from London, he is engaged on a tragedy, with Cæsar Borgia as a subject.

The Rev. Malcolm Maccoll, canon of Ripon Cathedral, England, who died Friday night, was one of the most active writers on controversial topics in the Church of England. Born in Scotland in 1838, he was educated at Edinburgh and at Trinity College, Glenalmond. Soon after taking holy orders he was appointed chaplain to the British embassy in St. Petersburg. Returning to England, he became curate of St. Paul's, Knightsbridge, in 1864; but, resigning in 1867, he went to southern Italy, where he spent two years in the study of theology, literature, and foreign politics. In 1871 he became rector of St. George's, Botolph Lane, London, a post which afforded him leisure for writing and engaging in public affairs. In 1884 he was appointed a canon residentiary of Ripon. Always an enthusiastic supporter of Mr. Gladstone, he wrote, over the pen name, "Scrutator," a treatise, "Mr. Gladstone and Oxford," in 1865. Three years later he published a pamphlet entitled, "Is There Not a Cause?" on the subject of disestablishment in Ireland. A man with strong convictions on many subjects, he wrote pamphlets and books on such varied topics as "Science and Prayer," "The Oberammergau Passion Play," "Who Is Responsible for the [Franco-German] War?" "The Damnatory Clauses of the Athanasian Creed Rationally Explained," "Reasons for Home Rule," "Lawlessness, Sacerdotalism, and Ritualism," "The Education Question and the Liberal Party," and "Life Here and Hereafter." He made a special study of Mohammedanism as a theocratic system of government, fatal, he contended, to moral and intellectual development. He was a zealous agitator in behalf of the Armenians. Among his published works relating to this topic were, "The Eastern Question: Its Facts and Fallacies"; "Three Years of the Eastern Question," "England's Responsibility Toward Armenia," and "The Sultan and the Powers." He was a constant contributor to reviews, magazines, and newspapers.

Numa Pompilio Llona, poet laureate of Ecuador, and a diplomat, died at Guayaquil April 5. He was born at Guayaquil in 1832, the son of Dr. José Leocadia Llona, one of the leaders in the movement for independence. After study in Colombia and Peru, he received at the age of twenty-one the degree of doctor of laws. Among the positions which he held in the next three decades were those of professor of æsthetics and literature at the University of Lima, and consul-general to Spain and to Italy. In 1883 he returned to his native country and was chosen rector of the University of Guayaquil, director of the School of Fine Arts at Quito, and finally envoy extraordinary to Colombia. He lived, however, at Guayaquil, where he had married, as his second wife, Lastenia Larriva, a poetess of Peru. Among his own poems were "Cantos Americanos," Paris, 1865; "Nuevas poesías y escritos en prosa," Geneva, 1870; "Noche de dolor en las montañas," 1872; "Clamores del Occidente," 4 vols., Lima, 1881-1882, and "Estela de una vida," Paris, 1893.

MODERN BIOGRAPHY.

Studies in Biography. By Sir Spencer Walpole. New York: E. P. Dutton & Co. $4 net.

We welcome these essays, reprinted from the *Edinburgh*, *Quarterly*, and *New Reviews*, not only for their intrinsic merits, but because they are a sign of that trend towards biography which is needed for the enriching of historical studies in general. Sir Spencer gives us serious studies of the following eight men, all of whom, except Gibbon and Shaftesbury, played great parts in nineteenth century statesmanship: Sir Robert Peel, Cobden, Disraeli, Dufferin, Gibbon, Bismarck, Napoleon III., and Lord Shaftesbury. There is probably no one in

England to-day who could write as authoritatively as he does on such a list of men, because he has, what most Englishmen lack, an intimate knowledge of Continental politics and personages since 1815. So he is able to deal with Napoleon III. and Bismarck as satisfactorily as with Cobden and Disraeli. What strikes us at once is the fulness of his knowledge: he knows not only the official document and the printed speech, but the anecdote which reveals character or the little play of human nature which, though but a feather's weight in the balance, yet sometimes determines a crisis. Next to this ample erudition is his fairness. Even when treating English party themes, which for most Englishmen still bristle with prejudice, he is no partisan. Himself a Liberal of the great school, he yet does justice to Disraeli; without hero-worship, he shows Cobden's greatness; he treats Peel's different phases with equal sympathy, and gives to Dufferin and Shaftesbury, two secondary but important men, their due. We pass from portrait to portrait with the assurance that the features are life-like and the work honest. Sir Spencer never avails himself of the portrait-painter's license of posing his subject in a telling light, or of dressing him in rich-hued apparel; he has neither Rembrandt glooms nor Titian glows; he can say, like Cobden, "I never perorate": and so we read him as trustingly as we look at a series of portraits by Sustermans.

The most remarkable essay in his volume is that devoted to Disraeli. It gives a fine character-sketch, and should be read with Mr. Bryce's less elaborate study. Walpole limits himself chiefly to Disraeli's parliamentary and political career, with frequent telling quotations from the flashy novels, to show his insincerity, his shallowness, his cynicism, his selfishness, his wit. He does not try to explain why such a man—a Jew by race, an adventurer in politics, a cynic and scoffer as to religion, an upstart in society, should become the idol of the great English Conservative party, with its Anglicanism, its cant, its distrust of innovations, its worship of pedigrees and titles, and its John Bull aversion to foreigners.

Three-fourths of Sir Spencer's essay on Gibbon is biographical, summarizing the latest versions of the famous autobiography; at the end, it touches on the "Decline and Fall," to which it does justice. The final passage, in which the essayist describes Gibbon's narrative as a "stately river" "replenished by many tributaries," has itself the statelincss of the palmy days of the *Edinburgh* and the *Quarterly*.

We cannot appraise, even briefly, the other papers, but we must call particular attention to the "Bismarck" and the "Napoleon III." The former is altogether the most satisfactory analysis in English of the Iron Chancellor's work as empire-builder. The Danish Question, the Hohenzollern candidature, the doctored Ems dispatch, are treated very clearly; so are the leading traits of Bismarck's character. We only regret that Sir Spencer did not lengthen his essay in order to include a summary of Bismarck's home career between 1871 and 1890. That is a theme that needs to be handled. Everybody now acknowledges Bismarck's achievement in setting Germany at the head of Europe, but his reputation as a constructive statesman has steadily waned—whether justly or not, we wish Walpole had told us. The general impression left by reading the study of Napoleon III. is that Walpole inclines to regard him less as a villain than as a well-meaning *Schwärmer*, who took to villany without scruple when his well-intended beneficence did not produce the results he expected: so we have heard of doting widowers who console themselves with drink. "Yet we must not forget," says Sir Spencer in a memorable passage, "that, from first to last, the story of the Empire is a story of crime, and that the story of the Emperor is the story of a conspirator. Through plot and counterplot he made his way to the throne; through plot and counterplot he moved to the Italian war, which was the commencement of his downfall; through plot and counterplot he drifted into the final struggle which ended at Sedan. His idea of statesmanship was intrigue; like the mole, he burrowed underground. Like the mole, his course was so tortuous, and so concealed, that those who were nearest to him were frequently unable to see whither he was trending." Interesting to reader and student alike is Sir Spencer's survey of the principal episodes in the conspirator-mole's tortuous career; for the latest French sources have been carefully explored, and they are supplemented by the special knowledge which Sir Spencer acquired as the biographer of Lord John Russell.

For a sympathetic study of a great philanthropist we commend the essay on Lord Shaftesbury—a personage as typically English as Disraeli was alien. On the biographical side it is further interesting, because it combines more of the private life with the public than suited the treatment of most of the other subjects. Such a book makes us wonder why it is that Americans who can write do not produce biographical essays like these. Is it because our magazines and reviews have become so *journalized*, in their effort to compete in sensations and novelties with the daily press, that they discourage possible contributors of the Walpole class?

CURRENT FICTION.

The Ministry of David Baldwin. By Henry Thomas Colestock. New York: Thomas Y. Crowell & Co.

The author designates his book a novel, but he would be better justified in calling it a novel once or twice removed. There is a hero, it is true (the minister), and an understudy for a heroine, his wife, together with many accessory characters; and there are conspiracy, dilemma, and death. If these do not make a novel, what would? It is perhaps as nearly one as can be fashioned out of a mere plea for the newer thought in the pulpit and the pews.

David Baldwin is a graduate from a Western divinity school, where the professors are all higher critics and the students more or less under suspicion of doctrinal unsoundness. Nevertheless, a Minnesota parish, languishing under long "candidating," finally compromises on David, and he is installed. There follow the annals of the difficulties that assail a modern minister in his first charge, who having most of his congregation with him, has to confront the opposition of a few champions of orthodoxy. Nothing so revolutionary as overt Unitarianism is advocated by David, nor anything quite so specific. His offence is a fondness for "the new thought" and an adherence to the higher criticism, distrust of "the older positions," and advocacy of the "newer conceptions," seldom particularized, but occasionally taking form, as in the matter of doctrine touching the Virgin Birth. There is calm and tolerant consideration of this and a few other points of belief, and various showings of the temptation to suppress the unpopular message, however it may burn within.

The story part of the book derives its sustenance from diaconal differences, scenes at the parsonage and at the various parish firesides. Of these the most congenial to David and his wife was that of the Stewarts, a large family of churchgoers, who brought home reports of the sermons to the mother, she having sustained a "partial loss of the use of her left leg."

A Crystal Age. By W. H. Hudson. New York: E. P. Dutton & Co.

This is the second edition of a book published in the eighties, as we gather from the author's preface. Of another book of Mr. Hudson's, "The Purple Land," E. V. Lucas makes one of his characters speak as "the nearest modern thing to Borrow that I know . . . the real thing." To compare him to Borrow is to seize Mr. Hudson's quality. To survey his field in the present story—a forecasting of a world that shall succeed this one—is to think of Wells. And if one can imagine a Borrow treatment of a Wells theme one may obtain a hint of the high fantasticalness of "A Crystal Age." To-day has shrivelled to an ignominious past. It has been a sacrifice to humanity's mad thirst for knowledge of good and evil; to the shameless searching into the secrets of nature; to learning gained by hands dipped in blood, "seeking in the living tissues of animals for the hidden springs of life." In gaining unsanctioned knowledge men have lost the higher faculty of discrimination; their riches have made them poorer, and the end has been death.

One Smith of Great Britain loses consciousness through a fall and wakes to find himself in a crystal age in a community of delicately organized human beings with senses of exquisite keenness and souls of crystal purity. The British gold in Smith's age-old pockets proves as ludicrously useless as ever did Robinson Crusoe's be-kicked lump. Only by a year's ploughing and tree-felling can he replace his primeval Scotch tweeds with the beautiful, decorated garments of the period. But industrial questions are only incidentally introduced. The likeness to Wells vanishes, giving way to a vision of a world not over-populated, noise-hating, beauty-loving. There is no guile or falsehood, there is intimacy with all that is good, enthusiasm for all that is lovely; tenderness for beasts, horror of the ugly. The cloud on Smith's horizon is the strange fact that warmer than fraternal love is unknown. The passion that he conceives for a daughter of "The House" brings him

against a blank wall of incomprehension. For the perfecting of the race it has come about that its renewal is vouchsafed only to elect mortals who must be fitted for their high office by a sacred training. A cryptic catastrophe ends the story, leaving the reader free to suppose anything.

Like most stories of the impossible future it contains its touches of the credible among the prevailing absurdities and the occasional touch of the tiresome amid many fascinations. Unlike most, it has the ring of genuine poetry, the zeal of the open air, kinship with beauty of all sorts, and a relieving glint of humor.

The Story of Bawn. By Katharine Tynan. Chicago: A. C. McClurg & Co.

A blameless little Irish story this, pleasantly situated at equal removes from politics and potheen. It is gratifying to find that though the motor car has glided in, the family secrets and family ghosts have not glided out. There is a pretty setting of Irish landscape, an amiable villain, a piquant heroine, a lover forty years old with white hair and black mustache, and there is the most delightful Irish precipitancy about the leading love affair. A good book for those readers who like their novels to be chronicles of the heart rather than of soul problems, finance, machinery, or economics.

Frank Brown: Sea Apprentice. By Frank T. Bullen. New York: E. P. Dutton & Co.

There is no longer hope that Mr. Bullen will add anything fresh to what he has already written of his sea experience and sea-lore. "The Cruise of the Cachalot," and "The Log of a Sea-waif" were spontaneous narratives of personal experience; even their tendency to rhetorical sentiment was acceptable as a token of the writer's ingenuousness. In "The Idyls of the Sea" the tendency had become a habit; a literary intention also became manifest, and side by side with it a leaning toward evangelical exhortation. The present book is pretty frankly a tract written for boys who have the sea-craving. It is a random patchwork of selected adventures, lessons in seamanship, criticism of the methods of captains, owners, and marine boards, and pious moralizing. Incidentally, Mr. Bullen has repeated occasion to express his dislike for America and Americans. It is to be hoped that his pictures of brutality on board Yankee ships, and of lawlessness in Yankee ports, are overdrawn, at least so far as they may be supposed to apply to present conditions. "Frank Brown" has little or no merit as literature; and as a tract it may prove to contain certain bits of sea description and language little likely to commend it to parental or other censorship.

Vittoria Colonna: With Some Account of Her Friends and Her Times. By Maud F. Jerrold. New York: E. P. Dutton & Co. $4 net.

On Vittoria Colonna so much has been written that whoever wrote one more book was in duty bound to surpass all predecessors. Although of late few or no fresh documents have been brought to light, Mrs. Jerrold might have ransacked *das ganze beweisende Material* and gone deeper into the relations of well-known facts; but her very preface conveys a disappointing impression as to the spirit in which she conceived and carried on her work:

> It must always be with diffidence that anyone puts forth a volume on such a well-worn epoch as that of the Renaissance, and this must be doubly felt in the case of a work like the present, which makes no claim to any sort of an original research, but is simply a selection of materials more or less generally accessible.

This is an unconscious expression of dilettantism at its worst. If dilettantism includes a love of knowledge picked up at random, with only an intermittent reverence for facts, this book on Vittoria Colonna is a dilettante book. Mrs. Jerrold's bibliography contains no mention of various essential accessible works: Mazzone's "Vittoria Colonna e il suo canzoniere" (1900), Tacchi-Venturi's "Vittoria-Colonna fautrice della riforma cattolica secondo alcune lettere inedite" (1901); Raczynski's "Les arts en Portugal"—a work which devotes 77 pages to the relations of Vittoria and Michelangelo; and Morpurgo's "Vittoria Colonna," a review of which by Renier is wrongly cited, though the biography itself is not mentioned. These are a few examples to prove that the author was far from careful in research. Mrs. Jerrold indicates her sources only when she is quoting some personage described in her book.

In the 317 pages of this volume hardly once do we get a clear vision of Vittoria, or feel the unity of her life. Through crudely interpolated biographies of her contemporaries and clouds of uninteresting generalities she emerges ever and anon, pallid and ill-discerned, like the moon on a murky night. And so with the portraits of other characters. Michelangelo, for example, cannot be resuscitated with platitudes about friendship (pp. 119-120, 137), yet the whole chapter on his friendship with the poetess is fairly padded with platitudes, or with generalizations that do not strike home.

Though Mrs. Jerrold's prose is often marred by anacolutha, her verses are almost invariably equal in charm and style to the originals which they so faithfully translate. In a word, Mrs. Jerrold is a gifted translator, and it is to her that we owe better renderings of some of the best poems of Bernardo Tasso, Giovanni Guidiccioni, Veronica Gambara, Gaspara Stampa, and of Vittoria Colonna than had ever before been made in English verse. *Perchè . . . serbi* (p. 132) is rendered as if it were *perchè . . . serba*, but the mistake is too slight to mar the good effect of this particular translation.

Lord Milner's Work in South Africa: From Its Commencement in 1897 to the Peace of Vereeniging in 1902. By W. Basil Worsfold. With Portraits and Map. New York: E. P. Dutton & Co. Pp. viii., 620. $4.50 net.

Mr. Worsfold's appreciation of Lord Milner brings the reader into contact with the high commissioner at his desk when cables and telegrams are being decoded; shows Lord Milner on the railroad train in some of his journeys between Cape Town and Johannesburg; and also at the telephone at Johannesburg when Lord Kitchener, after the conference of the representatives of the Boer commandoes at Vereeniging, is reporting that the result is to be peace. The intense loyalty, admiration, and intimacy that characterize the book all suggest a devoted private secretary, intent on setting his chief to the best advantage before the world. Yet clearly Mr. Worsfold was not associated with Lord Milner in that capacity during the most momentous period of the high commissioner's career; for although he is familiar with South African conditions and displays a knowledge of them that none but a resident could have acquired, there is a statement in the preface that he was in South Africa, first in the neighborhood of Cape Town, in 1883-85; and again—this time in Johannesburg—in 1904-5. Although the volume is marked by this intimacy, there is nowhere anything of the trivially personal. The book is on a high level, but it is all admiration of Lord Milner.

The South African section begins with the banquet at which Lord Milner was entertained in London, March 28, 1897, on the eve of his departure for Cape Town; and the narrative of the high commissioner's work first at Cape Town, and later at Pretoria and Johannesburg, is carried down to the final surrender of the Boers at Vereeniging, on May 31, 1902. In these five years, according to Mr. Worsfold, Lord Milner was always and on every occasion a great and far-sighted statesman. Every dispatch he sent to Joseph Chamberlain, the colonial secretary, is a proof of his statesmanship. If Mr. Worsfold's book should long remain the only exhaustive study of Lord Milner's South African career, the impression might be left that the high commissioner did not take a single step or utter a single word that he himself would now like to recall, during his admittedly trying and anxious years at Cape Town, Pretoria, and Johannesburg. Here and there the admission is made that Lord Milner wrote a dispatch or made a speech at white heat; but Mr. Worsfold always finds justification for these ebullitions of feeling. This attitude is as marked when Mr. Worsfold is tracing the abortive negotiations which preceded the Boer ultimatum of October 9, 1899, as when he is narrating the work of reconstruction. Every step of Lord Milner at this later stage is followed in detail. Much stress is laid on his efforts to prepare the way for a large British immigration into the new colonies; but there is no explanation of the failure of this part of the scheme.

After what has been said as to Mr. Worsfold's admiration of Lord Milner, it is almost unnecessary to indicate his attitude towards the war. In brief he holds that the Boers had shown themselves utterly unworthy of the administrative autonomy conferred on the Transvaal and the Free State by Great Britain, and judged by the laws of war they were saved from the alternative of physical annihilation or abject submission by the almost quixotic generosity of the enemy. As might be expected, Mr. Worsfold is strong in his condemnation of Sir Henry Campbell-Bannerman, John Morley, James Bryce, Lord Courtney, and other Liberal leaders for their utter-

ances, especially during the guerrilla stages of the war; hut even to a student of the history of recent South African politics whose sympathies were with these Liheral leaders Mr. Worsfold's work is not without value. Its importance lies in the state papers and documents on which he has so largely drawn; and especially the letters and telegrams which fell into the possession of the Military Intelligence Department of the British army at Bloemfontein and at Roos Senekal, when the Boer Government laager was captured hy Sir Bindon Blood. These documents go far to suhstantiate the contention of the British population in Cape Colony and Natal that Kruger and the Boers long aimed at dislodging Great Britain from South Africa, and that in negotiating with Lord Milner their only intention was to gain time until they were quite ready to enter on this tremendous undertaking.

Die Metaphysik Avicennas: Enthaltend die Metaphysik, Theologie, Kosmologie und Ethik. Uebersethzt und Erläutert von M. Horten. Halle und New York: Rudolf Haupt.

The place of Avicenna in the history of philosophy is important, not because he marked an advance or created a single new idea hut because, in the first place, he gathered up with astounding industry and learning the entire science of his age; and, in the second place, expressed it in such adequate and intelligihle form that his encyclopædic treatises dominated European thought until the seventeenth century and still dominate the Muslim world. We might go even further and say that they have more than an historical value for us. They suggest the possihle future of some philosophical ideas of our own time, such as, in the hroad, pragmatism. That the system formulated hy Avicenna led in al-Ghazzali's hands to a quasi-pragmatic position seems clear. Its after fate is also clear. Whether our pragmatism may look to that same fate must lie with the future. But a very pretty argument might he huilt up to prove that the pragmatic method lay at the root of all the dry rot and inanition of the Muslim civilization. It is, then, somewhat astonishing that we have so little access to Avicenna's works. Mediæval Europe knew him far more fully if only in queer Latin versions. But the printed texts of his hundred hooks could be counted on the fingers; and still fewer, and short and unimportant, are the translations into European languages. Modern discussions of his system, too, whether hy De Boer or De Vaux or Munk or in the encyclopædias, show plainly this lack of material.

All the more welcome, then, is the present undertaking hy Dr. Horten of the University of Bonn. He is preparing a complete Arabic edition of Avicenna's principal encyclopædic work, the *Shifā*, to he accompanied hy a German translation and commentary. This is the first *Lieferung* of the translation and commentary—and cuts into the middle of the work in order to begin with the part of greatest general interest. Whether there is to he a continuation will depend, naturally, upon the success of the first parts. But that the work should he completed there can be no question and, complete or incomplete, it should find a place in every library interested in the history of philosophy. Without the Arahic text the translation cannot he criticised in detail, hut it is certainly a careful and solid piece of work. Dr. Horten has the additional advantage that he knows thoroughly his Aristotle and Thomas Aquinas, the two most important keys to Avicenna. We wish him all success to his long lahor. For magnitude it should really he undertaken hy an Academy of Sciences at Cairo or Damascus or Teheran; hut such things are not in the East. Was it pragmatism that saw to that?

Science.

Experimental Evolution. By T. Hunt Morgan. New York: The Macmillan Co. $2.75 net.

Several weeks ago in the columns of the *Nation*, in a résumé of recent scientific work, reference was made to the dominating influence of the experimental method in almost all departments of hotany and zoölogy. Professor Morgan is the first clearly to emhody the more important results ohtained in zoölogy from this method of research as contrasted with the descriptive and historical. The author long ago won his spurs in this field, through his unrivalled researches in the phenomena of regeneration; and he has now proved himself a master of compilation—selecting the most significant experiments carried on in various countries, weighing them fairly, and summing up with a conservatism which is perhaps the most valuahle feature of the hook. The thoroughness and lucidity of the work make it serve three distinct purposes: the intelligent layman without any previous knowledge of the suhject may read and appreciate any part of it; the student of experimental zoölogy will find it a veritahle *vade mecum;* and the advanced scientist will he glad to refer to the generous summaries of literature relating to each suhject.

There is much original matter, in spite of the space necessarily given to compilation. After treating the changes arising from external influences, Professor Morgan considers the inheritance of these changes. Upon the ever-disputed questions of the inheritance of acquired characters, telegony, and xenia, his verdict, as may he conjectured from the present state of our knowledge, is "not proven." He allots no fewer than five chapters to "experimental hyhridizing," an indication of the importance of this phase of the new science. Among his other topics are cross-fertilization, inhreeding, and the theory of evolution. The author admits that "so many questions are still unsettled that any conclusion drawn from the evidence that we now possess must he provisional and perhaps premature." The conclusions which he draws are, however, almost wholly on the side of the theory of mutation as opposed to natural selection in the restricted sense. He says significantly: *"On the mutation theory, selection destroys species; it does not originate them."* Chapters detailing experiments upon growth, regeneration, grafting, and the life-cycles of animals and on the determination of sex and the secondary sexual characters, complete the volume. Such phrases as "It is surprising that no experimental proof of this kind has heen furnished" are of frequent occurrence, and are of more directive and stimulative value to the student than any amount of the thin speculation and theory with which too many of our text-hooks ahound.

Two minor criticisms relate to the make-up of the volume. The illustrations of moths and hutterflies are confusedly numhered, there heing no distinction hetween the numeral which relates to the illustration as a whole and the designation of each insect. The most serious defect is in the index, which is all too scant for such a mass of diverse suhject matter. The index might well he three times as large.

Ad-Damiri's Hayat al-hayawan (a Zoölogical Lexicon). Translated hy Lieut.-Col. A. S. G. Jayakar. Vol. I. London: Luzac & Co.

Fleischer has recorded somewhere that one of his scientific colleagues never met him without saying "Kazwini!"—an admonition to translate the great cosmography of that Arahic author. Unhappily Fleischer was too much occupied with grammar and lexicon to heed this, and had hesides the too common idea that Kazwini could not he worth translating hecause he was often so far from scientific fact. Folklore and the admission that whatever men have once helieved is worth knowing were still in the future, and Kazwini is still untranslated except for a small part.

It is from this latter point of view, then, that the still more important "Life of Animals" hy Damiri is of interest to us. No one, certainly, will ever go to it for zoological information, even as to the forms of life of the desert. Its Cairene author—he was horn there in 1344—was a student and professor of religious traditions and canon law, and prohahly had as little direct knowledge of the desert, though he made the pilgrimage several times, as he evidently had of natural history. His ohject was to write a dictionary of animal names, adding to the philological an encyclopædic element. He first explains the occurrences of each animal in the Koran and the religious traditions; secondly, the lawfulness of the use of the animal in every way; thirdly, the proverhs in which it is mentioned; fourthly, the medicinal use of its different parts; fifthly, its meaning when it appears in dream. But all this is so overlaid, illuminated and ohscured, hy a mass of comment, edifying and unedifying—verses, stories, jests, pious legends, witty replies, talismans, and charms—hanging often on the merest verhal thread of allusion; that it is the veriest sheep's-head of literature for a fine, confused, mixed feeding. Even in "Tristram Shandy" there is prohahly no such case of divagation as when our author, under the rubric *Goose*, and starting from a tradition that geese hissed in the face of Ali just hefore he was assassinated, wanders off into fifty-one large quarto pages of history of the Caliphs and supreme rulers down to his own time, showing that every sixth had heen deposed or assassinated. Then he returns and takes up *Goose* again.

So Col. Jayakar could hardly have done a

better piece of work for folk-lore in general, and especially for our knowledge of Muslim ideas and attitudes of mind than this translation of Damiri's great encyclopædia. There is no question that the crying need in Arabic study at the present day is translations rather than texts. The Oriental presses are publishing texts in an abundance with which European editors can never compete. The necessary thing is to convince the Western public that there is anything in these texts worth reading. Just as the "Sacred Books of the East" increased interest in the Indian religions a hundred-fold, and practically created the science of comparative religion, so it is for Arabists to make clear that there is the great civilization of Islam awaiting our intelligent attention. That will be greatly helped by such a book as this. The translation is literal often to clumsiness and even obscurity, and would be greatly improved by sub-editing; but it is very exact, and the translator's general scholarship seems excellent. May he be able to complete this translation and then turn and take up Kazwini!

"Recent Progress in the Study of Variation, Heredity, and Evolution," by Robert Heath Lock (E. P. Dutton & Co.), is another addition to the lengthening list of volumes, both German and English, which are intended to give a sweeping review of the evolution of the doctrine of evolution. This new work is written from a strictly British point of view, but it has not the all-saving grace of presenting the old facts in a new way. The theory of mutation and biometry occupy the major part of the new volume, while such phases of evolution as mimicry and parallelism are dismissed with a paragraph or two. The method of treatment is not encouraging to the average layman, who would not get far beyond the first chapter. The subjects and their facts are well arranged, but are set forth with a heaviness of diction which makes it difficult for any one, except a biologist already familiar with the subject, properly to correlate the facts as he reads. There is a glossary, but the general reader has less need of definitions of *albino* and *botany*, than of such terms as *heterozygote* and *allelomorph*, even if the latter are explained somewhere in the three hundred pages. The sphere of usefulness of this volume will be among senior biological students rather than among either advanced scientists or general readers.

The paper of greatest interest to American readers in Petermann's *Mitteilungen*, No. 2, is Prof. H. Erdmann's discussion of the problem of the Colorado River, intended as a contribution to the history of salt lakes and steppes. He prefaces it with a reference to the changes of the Mansfeld salt lake in Prussia in 1892, and closes with an appeal to American naturalists to devote themselves to a study of the remarkable changes in California. "Would it not be in the highest degree blameworthy," he says, "if this rare, perhaps never recurring opportunity, should pass without the collection of an exhaustive mass of observations of such important alterations of the earth's surface?" Dr. R. Hermann contributes a history of the negotiations between England and Germany during the years 1885-1906 in regard to the northwestern boundary of Kamerun, in Africa. This peaceful method, in which the interests of the people most concerned were the determining factors, is contrasted with the old-time method of settling boundaries by force of arms. Professor Höck, who has for many years been collecting facts in regard to the distribution of the flora of northern Germany, publishes the first of a series of papers on this subject, which is largely devoted to a list of trees and plants. It is accompanied by a map, as are the other articles.

The scientific work of the Philippine Government is centralized in one laboratory, and the various divisions are combined under the Bureau of Science. The report of the director, Dr. Paul C. Freer, shows 70,562 examinations of various sorts (biological and bacteriological examinations, chemical analyses, and assays) made during the year ending August 1, 1906. The average of monthly examinations in these various branches of Government service is about 3,000, but during a threatened epidemic of bubonic plague in April, May, and June of 1906 some 40,000 post-mortems were performed on rats. After four or five years of effort to exterminate locusts by propagating a fungus disease among them, the attempt has been abandoned, proving unsuccessful, as it did also in South Africa. On the other hand, considerable success has been obtained in immunizing cattle to rinderpest by means of a serum, and the demand for this serum increases from many parts of the archipelago. Results of cholera vaccination in Bilibid prison had been wholly favorable up to the time of makiug this report. Some inoculations had also been attempted in neighboring provincial towns. In Angat, Bulakan province, 1,078 individuals (one-sixth of the population) were inoculated; of 122 cases of cholera occurring subsequently, only one case occurred among the persons inoculated. It is stated:

It is the opinion of all who have been actively concerned with this work in the bureau that the method best adapted to limit or to eradicate endemic cholera in any country is by vaccination, just as smallpox has been limited by similar means. That vaccination will entirely remove cholera from a given country is not to be supposed, any more than that smallpox vaccination has accomplished the same end with the disease against which it is practised, but vaccination against cholera would certainly remove the danger of extended epidemics, just as has been the case with smallpox, and consequently it would remove the necessity for a burdensome and costly quarantine and for many other disagreeable sanitary measures.

George Otis Smith is to be director of the United States Geological Survey, to succeed Charles C. Walcott, who has been appointed head of the Smithsonian Institution. Mr. Smith was born in Hodgedon, Me., in 1871, received his bachelor's degree from Colby College in 1893, his master's degree in 1896; and in the same year a Ph.D. from Johns Hopkins. For nearly fifteen years he has been engaged in geological work, and his reports have been published by the United States Geological Survey.

The professors of the National Museum of Natural History at Paris have issued an appeal to naturalists of all countries for subscriptions to a fund for erecting in the Jardin des Plantes a monument in honor of Lamarck. Professor Joubin, 55, Rue de Buffon, Paris, is secretary.

The death of Dr. Xavier Galezowski, an oculist of European reputation, is reported from Paris. He was born in Poland in 1833, and he received his degree of doctor of medicine at St. Petersburg in 1858. He wrote a large number of treatises on his specialty. A son, Jean Galezowski, is also a distinguished oculist.

Drama.

Prof. Julius Goebel's edition of the First Part of Goethe's "Faust" (Henry Holt & Co.) is a worthy successor and a welcome supplement to the edition of Goethe's drama by Calvin Thomas, which we commended in these columns some ten years ago. The merit of Thomas's introduction and commentary consisted in this: that here for the first time there were presented to English readers, by a scholar of good sense and keen discrimination, the results of German philological criticism of "Faust" in the preceding thirty years. Professor Goebel, while equally well versed in philological research, brings to his task a faculty which cannot be said to be Professor Thomas's strong point: the power of poetic and philosophical appreciation. His edition is a decided help toward a just valuation of the artistic significance and the spiritual import of Goethe's masterpiece; and if his comments are not always final or thoroughly convincing, they certainly always betray originality of thought and often open up new views. The most striking contribution, perhaps, made by Professor Goebel in this edition to the fundamental problems of "Faust" exegesis consists in his attempt to prove a direct connection between Goethe's early "Faust" conception and Neoplatonism. Whether the verbal coincidences between certain scenes in the "Urfaust" and certain passages in lamblichus's "De Mysteriis" are indeed incontrovertible evidence that Goethe had studied this philosopher, as Professor Goebel insists, may be open to reasonable doubt. But this does not diminish the service done by Professor Goebel in having brought out more clearly than any of his predecessors the inner affinity between the religious atmosphere of the Pietist circles in the Frankfurt of Goethe's youth and Neoplatonic ideas handed down to them through Italian humanists. Altogether, this edition of "Faust" is a credit to American scholarship and an important step in the development of sound methods in the academic study of German literature.

In the last few months several well-known Norwegian and Danish actors have arrived in this country. They have finally banded together and obtained Ole Bang, the Norwegian dramatist and interpreter of Ibsen's works, to form a stock company to play in Brooklyn, Boston, Philadelphia, and some other cities. They will produce works by leading Scandinavian writers.

The secretary of the English Drama Society announces the intention of the organization to establish a "Théâtre Libre" in London, beginning with a short season in May, which, if successful, will be continued in the autumn. It is hoped

that because of the comparative smallness of the expenses—the Bijou Theatre, Bayswater, will be the home of the enterprise—the society may escape the fate of other "literary theatres" in England. "Cleopatra in Judæa," by Arthur Symons, will be produced, with "The Hour," a play in three acts, by Nugent Monck. These will be followed by Browning's "Pippa Passes," Ibsen's "The Master Builder," and Shakespeare's "King Lear." Each play will be given for six evening performances and two matinées.

Music.

Grove's Dictionary of Music and Musicians. Edited by J. A. Fuller Maitland. Vol. III., M.—P., New York: The Macmillan Co. $5 net.

In comparing the new edition of Grove's musical dictionary with the corresponding volumes in the first edition, one notes with interest the new names that have been added; for they constitute a convenient index of progress during the last quarter of a century. The new volume iii., which begins with Maas and ends with Pyne, includes, for the first time, the names of MacDowell, Mahler, Mancinelli, Mascagni, Milloeker, Napravnik, Paderewski, Paine, Parker, Pierné, and Puccini among the composers; while to the list of singers and conductors have been added the names of Mallinger, Malten, Maurel, Mottl, Nevada, Nikisch, Nordica. Considering that this is only one of five volumes, this list is not discouraging, although, to be sure, there is a decided anti-climax when we compare this period with the seventeen years from 1797 to 1813, during which were born eight of the greatest composers: Schubert, Berlioz, Mendelssohn, Chopin, Schumann, Liszt, Verdi, and Wagner.

Among the other subjects, newly introduced in volume iii., are Military Sounds and Signals, New York Musical Societies, and Negro Music of the United States. Altogether, the space has been expanded by over one-fifth, and the editor and his associates have almost invariably done their work well, thus making "Grove," more than ever, a necessity to every amateur and student. Of the subjects treated with special care and fulness, we may mention Mendelssohn, Mozart, Opera, Organ, Oratorio, Pianoforte, Pianoforte Playing, and Programme Music. The space originally assigned to Mendelssohn now seems absurdly disproportionate to his deserts; yet Grove's article was so admirable a specimen of biography and appreciative criticism that it would have been little short of a crime to shorten it; the present editor, in fact, did not hesitate to lengthen it still further, by asking F. G. Edwards to add the new matter bearing on Mendelssohn which has in the meantime come to light. The article on Oratorio takes up no fewer than 72 columns, all but 12 of which are new—by Dr. Ernest Walker, who seems hardly in place in a dictionary; like a bull in a china shop, he smashes everybody's favorite crockery. Handel fares almost as badly as Liszt; and as for England's pride, the choral societies, he informs them that in 999 performances out of a thousand Handel's directions are blandly and totally ignored. There will doubtless be much angry protest when the contents of this slashing article become known.

Two American composers—MacDowell and Paine—are honored with full-page portraits, and are treated sympathetically by H. E. Krehbiel, who naturally dwells particularly on MacDowell's Indian suite. The author of the article on American negro music, Frank Kidson, sums up his conclusions in these words:

> The modern "coon," or "plantation," songs, and the popular form of syncopation called "rag-time," are all easily to be traced to their source in the older negro songs, which . . . are probably to be regarded as European in melodic origin, translated into rhythms that have been handed down from the generation of slaves who actually came from Africa.

Mistakes will occur in the best-edited dictionaries. On p. 732, C. P. E. Bach's "Versuch über die wahre Art das Clavier zu spielen" masquerades as "Versuch über *das* wahre Art *den* Clavier zu spielen." Quite inexcusable is the acceptance as a fact of newspaper gossip (p. 390) concerning Mme. Nordica's alleged "third marriage."

Special interest attaches to a concert to be given at Mendelssohn Hall on Wednesday evening, April 17, by Mr. Lhévinne in behalf of the MacDowell fund. He will play three of MacDowell's pieces, three by Rubinstein, a Brahms sonata (F minor), and Chopin's Allegro de Concert.

Notwithstanding the presence of Puccini, Wagner came out ahead in the number of performances at the Metropolitan Opera House this season. His operas were heard 24 times, Puccini's 21. Verdi's figure was 11, Gounod's 9, Humperdinck's 8, Berlioz's 5, Donizetti's 5, Leoncavallo's 4, Giordano's 4. Delibes and Flotow had 3 each, Meyerbeer 2, Bizet, Mascagni, and R. Strauss 1 each. Taken by nationality, the Italians (Puccini, Verdi, Donizetti, Leoncavallo, Giordano, Mascagni) had 46 performances; the Germans (Wagner, Humperdinck, Meyerbeer, Flotow, Strauss) had 37; and the French (Gounod, Berlioz, Delibes, Bizet) had 18.

The Bonn Festival will be held May 5 to 9. The Joachim Quartet and the Carl Halir Trio, with Ernst von Dohnanyi as pianist, will appear, and vocal music will be contributed by the De Jong Quartet from Berlin. Schubert's chamber music is to be largely drawn upon this year, but the fourth day of the festival will be devoted entirely to Beethoven, and the third to Brahms—that being the anniversary of his death. A selection from the quartets of Haydn and Mozart will also be heard. At Munich a Mozart festival will be held August 1 to 11; and a Wagner festival August 12 to September 14. Among the singers to be heard at the latter are Ernestine Schumann-Heink, Knote, Burrian, Kraus, Burgstaller, and Van Rooy.

A German philosopher once called architecture frozen music. This was fanciful, but not nearly so baseless as the disposition of professional musicians to make the architectural, or structural, part of music the sole test of greatness. The greatest living composer, Edvard Grieg, has suffered much from this critical ineptitude. Concerning Chopin, W. H. Hadow wrote not long ago that he "can claim no place among the few greatest masters of the world," because "in structure he is a child, playing with a few simple types." Even if this were true, which it is far from being, it would not prove Mr. Hadow's point, for no master ever exceeded Chopin in the power of creating absolutely new melodies, new rhythmic combinations, new harmonic progressions and modulations, which are the real test of musical genius. Structure can be taught—many second and third-class composers are masters of musical architecture—but the creating of new melodies no one can teach or learn. Now comes Prof. Edward Dickinson, in the current number of the *Musician*, and declares that we must deny Schubert "the higher constructive power" and "confess that this defect must forever forbid him a place in the shining rank of the greatest artists." As a matter of fact, Schubert was too emotional, too poetic, to write "frozen music" of the architectural, sky-scraper kind. But if his last two symphonies are somewhat free and rambling, this does not alter the fact that in melodic and rhythmic originality they at least equal Beethoven's, while they surpass those in beauty of orchestration and novelty of modulation. Beethoven's sonatas for piano are better than Schubert's, not so much for structural reasons as because there are more good ideas in them. Schubert reserved his best thoughts for his songs, in which he created almost every possible variety of form—perfect in construction—and his short pianoforte pieces, which Rubinstein deemed even more unfathomable manifestations of genius than the songs, and which were the precursors of all the short pieces of Mendelssohn, Schumann, and Brahms. Schubert was the first to introduce the Hungarian element into art-music; he created the Vienna waltz; he was the most spontaneous melodist that ever lived, and his harmonic system, as Dr. Riemann has said, contains the roots of not only Schumann, but Liszt. How insignificant a detail that "higher constructive power" seems compared with all these traits of supreme greatness.

Désirée d'Artot-Padilla, one of the most famous of European light sopranos, has died in Paris. She was the daughter of Jean Désirée d'Artot Monsagney of the well known French musical family. Born in Paris in 1835, she made her début at the age of twenty-one in Brussels in concert. Later she sang in opera, and was for several years at the Paris Opera House. She travelled as a star through Europe, and was especially popular in Germany and Russia. She sang all the lighter soprano rôles, and was one of the teachers of Mme. Sembrich in répertoire and mise-en-scène. She married José Padilla, the Spanish barytone.

Art.

A Manual of Historic Ornament. Prepared for the Use of Students and Craftsmen, by Richard Glazier. Second edition, revised and enlarged. New York: Charles Scribner's Sons. $3 net.

This is a large, thin octavo, crowded with

little pictures in line, and occasionally giving solid black backgrounds to relieve the patterns. For a book devoted avowedly to "ornament" there is an unexpected amount of care and thoughtful analysis given to architecture in the larger sense of construction, disposition, and ordonnance. This is seen also in the illustrations; for the whole façade of the Palazzo Strozzi, of the Palazzo Vendramini, and of many others are given, the whole east front of the Parthenon as restored, a great Roman triumphal arch, and large details of many important buildings. Still, of the six hundred little pictures, more or less, the greater number are devoted to ornament in the more usual sense of the word. Objects are included which are wholly decorative, such as pottery and glass vessels of Roman and of Venetian design, Chinese porcelains, plates and vases, and the sculpture of architectural work in wood and cut stone.

Such pictures and their accompanying text would be of great use if they could be thoroughly systematized or made accessible by complete and minute indices. In the present case there is no index of consequence—three pages of reference to the leading subjects and the chief monuments described, and that is all. On this account one doubts the practical utility of the book, and imagines that the student of more thoughtful character would be better served by a book of more narrow scope and of greater thoroughness. As for general accuracy, it is probable that no such compact treatise can be found free of rash statements and unjustifiable use of familiar terms. The margins of our copy are marked with pencil corrections, but they are too numerous even to hint at here. Still the general tendency of the book is to be praised; and the author's knowledge of the many subjects treated proves in almost every case sufficient.

If the printers would procure a new font of type, with accents on the capital letters for French and Italian words, much blundering by youthful students would be saved. To have a familiar kind of enamel described as CHAMPLEVE in one line is not wholly set right by the appearance of the word with an accent on the final *e*, three lines below. In this and in other such ways there would be perhaps several hundred errors to correct if one were to prepare a revised edition.

The latest number of George Newnes's series of The Master Etchers is devoted to the work of William Strang, A.R.A. While we cannot agree with the author of the text, Frank Newbolt, that Mr. Strang's portrait heads surpass those of Van Dyck, or that many of his designs are as perfect as Mr. Newbolt thinks them, yet there is no doubt that Mr. Strang is an etcher and engraver of a pronounced individuality and great technical power, and that the best of his plates are extremely effective. The poorer ones, such as the early Manoah's Offering, have a mechanical cross-hatch that is distressing, and his figure drawing sometimes sinks from its usual characteristic and wilful ugliness to sheer feebleness. On the other hand it occasionally rises to something suggestive, or reminiscent, of Millet's austere beauty. His handling of needle and acid, or rocker and scraper, one takes to be really masterful.

Amian L. Champneys's "Public Libraries" (London: B. T. Batsford) is the first comprehensive handbook on library architecture in the English language. As such it will supply a want that has long been felt, as well by architects as by all those concerned with the building and management of libraries. The book contains all the most modern examples and ideas and deals exhaustively with every detail. Of the fourteen chapters which go to make it up the first is introductory, ii.—xi. relate to materials and construction, installation and apparatus, fittings and furniture, and the various rooms required in public libraries, while the remaining three deal with preliminary considerations, finance, choice of site, etc., and the general principles of public library design in regard both to planning and to æsthetic treatment. In addition to two appendices with lists of the acts of Parliament affecting public libraries, there is an excellent index. The book contains 200 pages with more than 100 illustrations.

Osvald Sirén's important study, "Don Lorenzo Monaco" (Strassburg: Heitz, 54 plates), comes late to our notice, and we cannot give it the space it merits. This young Swedish critic, whose work appears in German, has brought out admirably both the technical and æsthetic qualities of the greatest of the transitional painters at the opening of the Quattrocento. Pointing out the essential differences between Florentine and Sienese painting in the fourteenth century—the city of the Virgin seeking decorative harmony and mystical expressiveness, while the city of the Baptist sought representative draughtsmanship, tangible effectiveness, and corresponding simplicity and directness of emotion—Sirén shows how Lorenzo Monaco combines in a manner the ideals of both schools. By deliberate study of the Sienese he renovated the Giottesque tradition which had been both staled and distorted by the followers of Angelo Gaddi. Thus the Camaldolite monk gained a personal style, in which harmony of line—calligraphy in the nobler sense—counted for much; intimacy and exquisiteness of emotion for more. We can take exception only to the author's attempt to show that after all Don Lorenzo was in the main current of Florentine development. In spite of his widespread influence one could hardly concede that. His manner is personal and isolated; his roots, where discernible, in the Byzantine past. His manner repeats itself in larger and more significant fashion in the later work of Botticelli. A similar passion for rhythmical line, a kindred introspective spirit, and a like mystical mood produce analogous results. One will recall, too, that Botticelli had also served his turn with the realists; in other words, made a conscious refusal of their manner in favor of one both more archaic and singularly personal. In fact, before both these artists, one is driven to such remote but spiritually genuine parallels as that of the priestly school of Japan in its best estate. These are some of the considerations that Sirén raises in this learned and enjoyable work. It is one of the few recent productions of the neo-Morellians that would repay translation into English. Finally, it is a distinction, as things go today, for so young a scholar to have written so big a book without indulging in unamiable or scornful expressions towards his predecessors and contemporaries.

The heightening of the Assuan dam sufficiently to raise the level of the water twenty-three feet will no doubt be injurious to the antiquities of the neighborhood. All possible means, however, are to be employed to minimize this injury. The temples flooded will be strengthened; a thorough archæological survey of Nubia, in which the principal archæological societies are invited to coöperate, will be undertaken at the expense of the Government; and minute records will be made of every ruin between Wady Halfa and Assuan. Moreover, there is ample time to make their survey a thorough one, since the raising of the dam will probably take six years.

Among the dealers' shows in this city are paintings of horses and dogs by William J. Hays at Powell's, till April 13; paintings by Rockwell Kent at Clausen's, April 13; portraits by old masters at Ehrich's, April 13; recent pictures by Henry Golden Dearth, Julius Oehme's, April 15; pictures in oil, pastel, and water color by Mathilde de Cordoba, Louis Katz's, April 15; eighth annual exhibition of the American Society of Miniature Painters, Knoedler & Co.'s, April 20; mezzotints from the royal collection formerly at Windsor Castle, at H. Wunderlich & Co.'s; American paintings and Dutch water colors at C. Klackner's.

The death is announced from Brussels of Félix Cogen, the Belgian historical painter. He was born in 1838, and he ultimately became director of the Normal School of Art of Saint-Josse-ten-Moode. He frequently exhibited at the Paris Salon; his picture in 1905 was Le Dernier Séjour d'Érasme à Bâle en 1535; and in 1906, Louis XVI. et Saint François.

The Nature of Capital and Income. By Irving Fisher. New York: The Macmillan Co. $3 net.

In this volume Professor Fisher has worked out with his usual care and precision the theory of capital and income which has engaged his attention for at least ten years. He has been considerate enough to relegate to appendices the formidable apparatus of mathematical diagrams, formulas, and demonstrations, which accompanied some of his earlier articles in various periodicals, and has here set forth the essentials of his doctrine in a form that will not repel the non-mathematical reader. In point of thorough workmanship and nice finish, the volume stands in refreshing contrast to much—we had almost said most—of the economic writing in these days of unlimited license to produce undigested and indigestible literature.

So workmanlike is his performance that it is with regret that we are unable to rate the work more highly as a contribution to economic theory. Wealth he defines as all "material objects owned by human beings"; capital consists of the entire "stock

of wealth existing at an instant of time"; and income is "a flow of services" through a period of time. Having dealt with fundamental concepts, Professor Fisher proceeds to elaborate the theory of capital and income, treating at considerable length the reckoning of capital and income accounts, the summation of such accounts, and the relation of capital and income. Incidentally he is at great trouble to give a new turn to the definitions of price and value; the former being defined as the exchange ratio of a single unit of a given stock, the latter as the estimate placed upon the entire stock. This, he is persuaded, "follows closely the usage of business men and practical statisticians."

In the category of wealth Professor Fisher includes man himself, as Pareto and some others have done before him. This vagary of nomenclature has ordinarily wrought little harm, since authors have speedily forgotten it, and have not included child-bearing among the forms of productive labor or perpetrated the other absurdities to which the idea would lead if carried to its logical end. Professor Fisher, like the others, all but overlooks "human wealth" in his subsequent discussions; but in holding that all wealth existing at an instant of time is capital, he must logically consider man as capital, and must thereby confuse the theories of production and distribution beyond all remedy. In his system there can be but one factor of production—capital; and but one category in distribution—the earnings of capital, or whatever we may please to call them.

This brings us to what is, after all, the fundamental question raised by the volume: Is it logically necessary and scientifically fruitful to lump all sorts of realized wealth under the name capital, to refuse to distinguish between consumable wealth and instruments of production, and, among instruments of production, to deny that any substantial difference exists between land and what are usually called produced instruments of production? Nothing like an argument upon the subject can be undertaken in a book review, and it is difficult in the space at our command to do justice either to the skill with which Professor Fisher states his case or the weight of the countervailing objections. But in our judgment the attempt to assimilate land to the produced agents of production can be but a more or less "subtle obscuration of plain facts," as some one has well termed it. And it must he added that the more subtle and ingenious the attempt, the more we regret the misspent skill and industry of the writer.

If the traditional distinction between land and capital is "spurious," as Professor Fisher maintains, the traditional distinction between "rent as the income from land and interest as the income from capital" must disappear also; and, accordingly, our author relegates it to the scientific rubbish heap. He does Ricardo and others scant justice, however, in supposing them to be ignorant that "if we fix our attention on value return" from investments of production, the rate of return upon an investment in land is like the rate of return upon an investment in produced instruments of production. No one has ever questioned that the purchase price of land is the capitalized rent, but Ricardo and many others have maintained that the rent itself is determined by laws radically different from those governing the return received from what they called capital. The nature of the income from land, not whether the selling price shall be twenty, twenty-five, or thirty times that income, is the problem that Ricardo sought to explain; and upon that question Professor Fisher's book throws not a gleam of light.

Apart from these controverted questions the highest praise should be given to the author's discussion of capital and income accounts and of capital and income summation. There are, indeed, places where he might have omitted elementary discussion of matters of bookkeeping; but he is evidently guided by the desire to make every step of his argument plain to every reader, and in this he succeeds admirably. In the application of his theories to various economic problems, such as taxation, he is almost always interesting and helpful, and from the first page to the last retains his hold upon one's attention. Even the economists who disagree with his fundamental concepts and principles must admire the skill with which he has wrought out his arguments; while by those of his way of thinking "Capital and Income" will, doubtless, be hailed as a masterwork.

NEW YORK, THURSDAY, APRIL 18, 1907.

The Week.

If one but stops to consider the beginnings of the peace movement in this country, this week's Peace Congress seems little short of the marvellous. With more than a thousand delegates from all over the country, it seems as if for once peace had become the fashion. That much of what we have heard this week is purely lip-service, may be admitted without detracting from the value of the gathering. Peace, like religion, is far too often something to be discussed in the abstract, to be praised to the skies—and then to be forsworn when the test of belief is at hand. We have but to go back nine years to remember how few were willing to be known in 1898 as peace men, to say nothing of making outspoken protest against manslaughter by the nation. From those who but half believe, the cause will still suffer as it has in the past. If this Congress means that the movement is hereafter to be placed on a business basis, there is additional cause for rejoicing. Like every other, the cause needs organization, and on a far larger scale than hitherto; it should have a definite plan of campaign, and it should be as unceasing in its activity as are the navy leagues to be found in various places—latterly in this country. These work for the instruments of war by day and by night. In Germany the league has raised hundreds of thousands of dollars to buy cruisers for the Government. The peace leaders ought to combat every effort to increase our armaments and our fighting forces. To Mr. Carnegie and the others who have brought about this Congress the thanks are due of all who believe in the brotherhood of man.

Senator Foraker burned his bridges behind him in his speech at Canton last week. Nominally, he addressed the local Board of Trade, but actually his words were intended, not merely for Ohio, but for the whole country. He appears as spokesman for that wing of the Republican party which President Roosevelt denounces as "reactionary," "opposed to my policies." We need not ask for a nice definition of these terms. Senator Foraker, indeed, protests that he has antagonized the President in only three matters: the form of the Statehood bill for Arizona and New Mexico, the Hepburn Railway Rate bill, and the treatment of the Brownsville affair. But however much Mr. Foraker may protest, his differences with President Roosevelt evidently go far deeper. He objects to the President's policy of assuming complete control of the party organization, and naming a successor. He asserts his right to enter the field without being branded as a traitor to Republicanism, and, indeed, to the flag itself. Mr. Foraker does not mince words:

> That the President of the United States should become personally engaged in a political contest to determine his successor is without precedent, unless it be the bad precedent set by Andrew Jackson as to Martin Van Buren.

This, then, is a challenge of the wisdom of the President in selecting a candidate and throwing the whole weight of the Administration for him. Many Republicans who do not admire Senator Foraker, and who think highly of Secretary Taft, entertain the gravest doubts as to the advisability of thrusting Secretary Taft forward as the continuer of the Roosevelt régime. That régime may be as beneficent as its most ardent supporters say it is; and yet we may not become enthusiastic over a man who is set before us as nothing but the image of another. For the sake of Secretary Taft himself, it would be well that the Administration should not pull wires for him too openly, and that the President should not be provoked into outspoken advocacy of his cause.

No one will find fault with Secretary Taft's plan for the restoration of the Cuban Republic, save those who have selfish motives. That there are many such is unfortunately true. Numbers of men with investments in Cuba are unwilling to take Andrew D. White's excellent advice to set up the Republic seventy times, if necessary, rather than make it a part of the United States, because the setting-up process would probably affect their pockets. In the cafés of Havana there is no more familiar talk than the gossip that the rich planters will finance a revolution every other year for the next twenty years, if need be, in order to compel this Government to remain in Cuba. This may be done—revolutions are sadly cheap in the island—but meanwhile the President and Secretary Taft are playing their part bravely and frankly. They reiterate that there has been no change in their views since they established the provisional government, and that Cuba must be turned over to the Cubans just as soon as possible. As the first step towards the essential tranquillity and stability, Secretary Taft urges the taking of a census as the basis of an honest vote, and he rightly refuses to permit either this census or the election of a President to be hurried. Some Cubans would like to have the new President take office on May 20, the natal day of the Republic; but sentiment must give way to care and deliberation in reconstruction.

Details of the new tariff *modus* with Germany are furnished from Washington. As authorized by Section 3 of the Dingley Act, the President will make a proclamation admitting German champagnes at reduced rates of duty, in return for a concession by Germany of her minimum tariff rates and a removal of the special restrictions on the importation of American bacon and dressed meats. This agreement has, of course, to receive the approval of the German Government, which will certainly not be had without violent protests from the Agrarians. Moreover, the agreement is, in any case, to run but for one year. Then it must be superseded by a broad treaty of commercial reciprocity which Secretary Root is to negotiate. This latter will require the consent of the Senate, and it is admitted that "present indications are by no means favorable" for ratification of any treaty touching the sacrosanct tariff. Yet the indomitable optimists of the State Department think that, by December, 1908, the "prospects for ratification" will be "brighter" than "present conditions seem to indicate." Can the Administration expect, not to say hope, that the standpatters will be routed at the polls next year?

The conviction of the Standard Oil Company for accepting railway rebates will be generally—and properly—accepted as proof of the charges made, not only in the press, but in official reports, that the company has profited largely by taking unfair advantage of its competitors. Into the ethics of the question we need not enter. It is evident that a common carrier, enjoying the franchises, the peculiar privileges, and the powers of a railway, is bound to treat all shippers alike. The company to which it grants a secret rate can crush all rivals. This has been the case with the Standard Oil. As Secretary (then Commissioner) Garfield said last May in his report on the subject:

> The Standard Oil Company has benefited enormously up almost to the present moment by secret rates, many of these secret rates being clearly unlawful. This benefit amounts to at least three-quarters of a million a year.

This statement was vehemently denied by the officers of the company and by their apologists—clergymen, college presidents, and editors of the religious press. The two vice-presidents of the company, H. H. Rogers and John D. Archbold, declared May 4, 1906:

We say flatly that any assertion that the Standard Oil Company has been or is now knowingly engaged in practices which are unlawful is alike untruthful and unjust. . . . But all this aside [the question of Federal jurisdiction], there have been no secret rates nor unlawful discrimination in the interest of the Standard Oil Company.

The idea that these practices, so deliberately planned, so extensively applied, were carried on without the knowedge of the active heads of the company, is preposterous. We believe, however, that the Rev. Robert Stuart MacArthur and the other clerical defenders of the Standard Oil were deceived. They supposed that the fine protestations of morality uttered by Messrs. Rogers and Archbold were true. But the verdict of the Chicago jury on Saturday night, finding the company guilty on 1,462 separate counts, should open their eyes. In one set of counts the company received a rate of 7½ cents a hundred pounds when the published rate was 19½; in the other set the company paid 6 cents when the legal rate was 18. The jury brought in a verdict under which the company is liable for fines ranging from $1,462,000 to $29,240,000. No one will be sorry if the judge fixes the amount at a round five or ten millions. The only matter for regret is that the rich lawbreakers are not sent to the penitentiary.

The burning question, "What is whiskey?" having been adjudicated by so high an authority as the United States Attorney-General, less important products may ask for their day in court. But except the makers of what Mr. Bonaparte called "something better than whiskey"—water, neutral spirits, and flavoring extract—we have seen no cases so sad as those of the manufacturers who have suddenly discovered that the trade-mark law which they had regarded as a very bulwark of defence, leaves them in reality hopelessly vulnerable. It was not generally realized that "labels" included "trade-marks." For instance, a medicine-maker whose trade-mark promises "instant cure to sufferers" may have been protected by the courts for years against rivals who offered "immediate alleviation" or "instantaneous improvement"; the device showing the venerable Dr. Waldteufel in the act of discovering the precious compound, could be reproduced on no other medicine. But all this is nothing. The cold-blooded Department of Agriculture calmly observes that the medicine does not cure instantly and that there "never was no such person" as Dr. Waldteufel. The valuable trade-mark name "Electric Oil" is in jeopardy because there is nothing electric about the stuff. "Cure" is barred as the name of a preparation. The immemorial term "hair restorer" is threatened, because it cannot be depended on to restore hair. Even the various "cereal coffees" are in danger, because they are not coffee. This is a different matter from the unmasking of the New Jersey varieties of Roquefort cheese, Munich beer, and the like. But the *Trade-Mark Bulletin*, which enumerates a number of these cases in its current issue, adds that "there is to be derived from the law a considerable degree of protection for honest marks."

If we could not have a conviction of Thaw, the fact that seven jurymen stood out to the end for a verdict of murder in the first degree, is the next best thing. Decent people will be thankful to them for thus putting an end to the perilous nonsense imported into the trial. We shall hear no more of the assertion that a rich degenerate, touched with megalomania, can in New York kill a man in cold blood, even if that man be a libertine, and that then justice will have no terrors for him. It is refreshing to learn that the preposterous pleadings of Mr. Delmas had no effect upon the jury except to disgust them. Even those of them who voted for acquittal did so in the belief that Thaw was insane. Thus all the heroics about the "unwritten law," dangerous in any case, wildly absurd in the present one, went for nothing. At least seven men on the jury had heads clear enough, and a sense of obligation to society and to their oath firm enough, to prevent them from being deluded by all the mawkish sentiment and crafty play upon the passions introduced into the defence of Thaw. If we have not, unfortunately, a clear instance of the rigid application of the law of murder, without fear or favor, we are at least spared the absolute disregard of it, with the appalling inference that no wealthy man need fear the penalty of his crimes.

The National Academy of Design, in refusing election to thirty-three out of the thirty-six candidates proposed, has merely followed the way of all academies. It is not that the ins are jealous —at least consciously—of the rising outs. The *arrivés*, the men who have in the course of years reached fame and a secure position, naturally look with a certain skepticism upon the efforts of younger men with other methods. Each Academician will give intellectual assent to the proposition that there are nine and sixty ways of constructing tribal lays, and every single one of them is right; but when it comes to the practical application of this catholic theory, he hesitates. In his heart of hearts he feels that of all the nine and sixty ways but half a dozen are really praiseworthy, and of that half-dozen, one—his own—is eminently the best. This is merely to say that the Academician is a human being, with fallible judgment, and unable to detach himself from prejudices of time, place, and person. We could wish that men who have won such distinction as Ernest W. Lawson —to mention but a single name—had been welcomed to the Academy; but as Kenyon Cox remarked to a newspaper reporter, "In so large a body it is difficult to get the required two-thirds to agree upon any one man." That difficulty, we may add, is the very thing that always has been, and always will be, the standing reproach of academies, the thing that lessens their influence and casts doubt upon their authority.

Even in the *Figaro's* selections from the Montagnini papers, mostly pro-Church as they are, one document has been published which will be seized upon by the Anticlericals as a justification for their course. This is a letter from Cardinal Merry del Val to the Archbishop of Lyons, calling his attention to "the capital importance of the next political elections in France." It was no mere general warning and advice. Detailed suggestions how to proceed were given. Money was to be collected, as by the League of French Women, but the spending of it was to be entrusted to the Church authorities. Merry del Val was most specific:

> Your Eminence should persuade the ladies that it is a good thing to collect money, but it should be handed to your Eminence with every confidence, you promising them that you will employ it exclusively for electoral purposes in the manner that you may judge most prudent and most advantageous. Your Eminence will afterwards come to an agreement with M. Piou for the selection of candidates and the distribution of the money.

Now, this looks amazingly like what the Anticlericals have charged—that the Church, as such, was directly meddling in French politics. From that it was a short step to the inference that there was a clerical plot against the republic itself. We do not draw that inference; but it is easy to see what the effect of so compromising a letter would be upon an already suspicious and excited Anticlerical party in France.

The threatened strike of the Paris bakers has more than its surface significance. It is one step more in the campaign of intimidation that has been carried on by the Socialist labor elements from the very beginning of the Clemenceau Ministry, simultaneously with the Parliamentary warfare waged against the Cabinet by M. Jaurès. Between the two, the Moderate press is beginning to complain that the Socialists have made themselves masters of the Government. The Moderates point to the action of Minister of War Picquart in punishing a corps commander stationed at Nancy for remarks against Germany, but, about the same time, re-

storing to the army a lieutenant who had been cashiered a year ago for declaring at a labor meeting that he would never obey his superior's orders to fire upon the "workmen." What better proof, is asked, can there be of the Government's complete subservience to the revolutionary unions and the fanatical "pacifists"? In fact, for all M. Clemenceau's resolution in moments of labor crises, it would appear that in the end he has yielded to the repeated demands of the Confederation of Labor under their militant chief, M. Griffuelhes. The great labor demonstration in Paris planned some months ago was forbidden, but a bill was enacted extending the right of public meeting to the widest limit. The electricians' strike was broken, but the strikers obtained pretty nearly all their demands. So now there is talk of the military bakers being used to replace any bakers that may strike, but such repressive action for the moment is likely to be followed by generous concessions.

In a series of studies of present-day Germany by the French journalist and traveller, Jules Huret, we come across an estimate of William II. from a point of view with which our own Andrew D. White has already made us familiar. With sympathetic appreciation M. Huret affords us a glimpse, not of the traditional mailed war-lord and compeller of battle clouds on the European horizon, but of a sagacious and self-controlled monarch who for nearly a score of years has been a powerful factor for Continental peace. There is danger of overcoloring this new representation of the Emperor as arbiter of peace, just as the older picture was greatly overdrawn. In reality, William II. is not, and cannot be, that absolute master of fate who may, without reckoning consequences, throw his legions across the Rhine or dispatch his cruisers on a dash for Dover. We speak glibly enough of hurling the splendid German army at this or that enemy; but an army, after all, is something more than a primitive javelin, and, however well it be disciplined, it needs more than the impetus of an imperial arm to be propelled with effect. It needs a soul of its own; and because the European standing army is so inseparably a part of the nation, its animating principle in times of crisis must be something that animates the nation at large. It is almost absurd to contend that a German army would be as invincible in 1907, fighting over Morocco, as it was in 1870 fighting for national unity. The standing army, therefore, which rightly enough we regard as one of the crying evils of the European political system, has this to be said in its favor: that, from the very fact of its being an army fed by national levies, it affords an appreciable guarantee against wars waged for frivolous causes or at the instigation of a self-seeking faction. In Western Europe it is hard to imagine a great war breaking out unpreceded by an upheaval of national animosity on either side. It is Sir Ian Hamilton's opinion, given in the second volume of "A Staff Officer's Scrap-Book During the Russo-Japan War," that among the qualifications which go to make a good private soldier, the first is that he shall hate his enemy. "Each Japanese private entered into the war with burning feelings of personal anger." But just because it is becoming more and more difficult to make nations hate each other without grievous wrong, governments must hesitate to throw against each other armies whose heart may not be in the fighting.

The action of the Electoral Committee of the German Reichstag in unseating one of the Conservative Deputies, Herr Richthofen, because of interference in his behalf by Chancellor von Bülow, would indicate that the complaisance of the Government majority in the Reichstag does not go to the point of acquiescing in an aggression on Parliamentary privilege. Prince von Bülow had come to the aid of the Conservative candidate in a newspaper appeal to the members of all bourgeois parties to unite for the defeat of the Socialists. This the committee, by a vote of seven to six, decided was illegal. Evidently, the Liberal representatives on the committee voted against the Government on broad Constitutional grounds. The denial of the principle of Ministerial responsibility to Parliament must have as its correlative absolute Parliamentary immunity from interference by the Executive. That the German Government has not held fast to this appears not only from its open interference in the election, but from the recent Erzberger case, involving a restriction on Parliamentary freedom of speech. The disqualification of Herr Richthofen may indicate the precarious nature of the Government majority; in any case, the Reichstag is to be congratulated on its spirit of independence. The hardiest imagination can scarcely conceive the election of a New York Congressman being set aside because of an open letter addressed to him from the White House saying, "Your success is necessary to the safety of the country and to the interests of the Republican party."

The resignation of the Belgian Cabinet, which has been expected for some weeks, was announced on Friday. Gathering difficulties have finally brought about the downfall of the Smet de Naeyer Ministry, after it had held power since August 5, 1899. The specific measure on which the Government was defeated was the law fixing the hours of labor in mines, which was adopted last week by 94 votes to 32. The Catholic Right, or Government party, had been split for some time on the question of liberal labor legislation, and the Young Catholics, who recognized that only by such a programme could they retain their hold on the working classes as against the Socialists, united with the Opposition to overthrow the Government. But probably the Congo situation was chiefly instrumental in bringing about the fall of the Ministry. The need for a thorough reconstruction of the colonial régime has been felt throughout the country, and a Parliamentary Commission is now engaged on the task. King Leopold's attitude towards any reform tending to weaken his control has not changed, however. Hence the dilemma of the Cabinet. Finding it impossible to oppose the royal master whose interests he had served so long and so subserviently, and finding it equally impossible to resist public opinion, M. Smet de Naeyer chose to resign office. The foreign press speaks of a feeling of general unrest and dissatisfaction which pervades Belgian politics, and of which the colonial problem is the most definite cause. Certainly, politics have reached an unhealthy state when, as we learn from the dispatches, a Ministry, bent upon resigning, permits the discussion of a measure in the Chamber after a royal decree withdrawing it from Parliamentary consideration has been secretly signed.

In the history of the woman suffrage movement the Finnish Parliamentary elections of a few weeks ago should remain memorable. The results, recently announced, show the election of nineteen women as members of the Diet, or about one-sixth of the total number. It may be a not unrelated fact that the attendance at the University of Helsingfors is given as 2,640 men to 564 women, or about the same ratio as will prevail in the new Diet. "Long before the elections," an eye-witness writes, "there had been a well-organized and active agitation going on among the women, and the result was that an immensely large number of women have voted." In Helsingfors 55 per cent. of the votes were cast by women.

Many old women were brought on little sledges, drawn by their children or children's children to the polling-places. Usually, married people went together. When I stood in the row, waiting for my turn to come, I heard a young laboring couple discussing in a kind and friendly way their own family affairs—the baby, the girl's winter cloaks, the boy's schooling—while they were waiting.

The dispatches state that nine of the nineteen women Deputies are Socialists, a ratio that would probably hold good for the country at large.

RIGHTEOUSNESS AND PEACE.

There appears to have been a pretty sharp difference of opinion at the Peace Congress, on Monday, over what looks a good deal, on close inspection, like a dispute about words. A phrase in President Roosevelt's letter started the controversy. He was for peace. But he was also for righteousness. If the two could be made to kiss each other, Scripture fashion, well and good; but if he had to choose between the two, give him righteousness every time. Yet the real question is if, at this stage of civilization, the great Powers of the world cannot make sure that we shall get both peace and righteousness every time.

The individual analogy—the status of the citizen before the courts of his own land—furnishes us the safest leading in this matter. A truly civilized man does not say: "I will, in general, submit my wrongs to the decision of appointed judges, to whom, also, I will confide the upholding of my rights, but in any case where I feel very strongly, and am thoroughly convinced of the justice of my cause, I will go out in person and club or shoot my antagonist." That would be border ruffianism. To take such a position would be to defend that barbarous and anti-social thing, "the unwritten law." The individual, we do not allow to decide whether he is "righteous" or not, in this judicial sense. We should be afraid that he would reduce everything to the simple formula: "What I want is righteous; what you desire is wicked." In a word, civilization has called upon men to give up being judges in their own cause, and to surrender the right of private vengeance. Murder, of course, persists, and lynch-law lingers, but both are recognized as survivals of savagery. And the real problem before the Peace Congress and the Hague Conference is whether an arrangement cannot be devised whereby a peaceful settlement of difficulties will be made as compulsory and satisfactory between nations as it has been between the citizens of each nation.

Secretary Root's address to the Congress pointed the way. He was said to have spoken for the Administration at Washington; but, to an extent, his words ate up those of the head of the Administration. Mr. Roosevelt's consuming fear lest the country may some day have to fight to prove that it is righteous, his Secretary of State showed to be practically groundless; for the chief point of Mr. Root's speech, in line as it was with the sentiment of some of the ablest and most enlightened jurists of the world, lay in his argument for a tribunal which could determine all international quarrels *judicially*. The weakness in international arbitration has always been the danger that decisions might lack this judicial quality. Arbitration tribunals have usually been made up of an equal number of delegates from each of the two disputiug nations, with foreigners added as a sort of umpire. But this may make an important verdict against a given country really that of one man, and he an alien. This fact, as Lord Salisbury said, has made great Powers unwilling to agree to submit *all* controversies to arbitration. But Secretary Root showed how vastly different the case is when you have an august and permanent tribunal charged to decide in a judicial way every question submitted to it. Then we get a true international court, before which litigant nations may as properly be compelled to go as the citizen is to his own tribunals of justice. "What we now require," said Mr. Root, "is the substitution of judicial action for diplomatic action, the substitution of judicial sense of responsibility for diplomatic sense of responsibility. We need for arbitration judges who will be interested only in the question appearing upon the record before them. Plainly, this end is to be attained by the establishment of a court of permanent judges who will have no other occupation and no other interest but the exercise of the judicial faculty under the sanction of that high sense of responsibility."

It is clear that when the world gets such a bench of international judges, the logomachy about righteousness *versus* peace will have to be abandoned. The proper word to use is "justice," not righteousness. The latter implies a sense of personal worthiness which has no place in a law-suit. What a nation in court has to establish is, not its good opinion of itself, but the justice of its claims. And all questions about the superior civilization or morality of one country, as compared with those of its contestant, would have to be ruled out, as much as would be the pretension of a rich man that he is entitled to a different article of justice from a poor man. Even national self-righteousness, comfortable as it may be, could cut no figure in a case at law. There would be no possibility, as the President seems to imagine, of the United States becoming the successor to that "censorship" which, as Lord Rosebery has said, England has always assumed towards the rest of Europe, entitling her to "administer exhortation and rebuke" to other countries. We should simply have a system of impartial justice for all, and the acutely righteous peoples would have to submit to it along with those that admitted themselves to be no better than an ordinary Christian nation.

On the side issue of disarmament, there seems also to be no little confusion of thought. The Rev. Dr. Morgan Dix triumphantly confutes those who criticised his sermon of Sunday in praise of war, by saying that the objectors would disband the militia, abolish the police, and leave us all exposed to robbery, assault, and anarchy. But no peace man in his senses disputes the need of a visible embodiment of the police power. Even courts must have officers to execute their mandates. And if we get an international court, clothed with great authority and extensive jurisdiction, there will be required a sort of international police force to see that its decisions are obeyed. Thus the question of disarmament is, at the present time, merely one of less or more. And a new argument for an international agreement to lighten military burdens is found in the state of the world's money-markets to-day. With the rate of interest everywhere rising, military debts become more crushing, and the reasons against adding to them more commanding. If the leading nations would bind themselves to knock off $25,000,000 each from their military budgets, the resulting free capital would do much to strengthen credit and give a fresh impetus to commerce and industry and all the arts of progress.

CRIMINAL LAW REFORM.

Whatever may be the result of the long-drawn-out trial of Thaw in New York, the case is a scandal of the first magnitude, and a terrible blot upon the legal procedure of the United States. We cannot but feel that the weakest judge on our bench would have long ago found a way of bringing the question to the verdict of the jury, and of putting an end to the mass of irrelevancies imported into the case, and to the long arguments, in which every rule as to the admissibility of evidence has been distorted beyond the bounds of absurdity.—[From the *Solicitors' Journal*, London, March 30.

This foreign comment but echoes what thousands of Americans have felt and said about the lamentable state of our criminal law. Its network of uncertainties; its fine-spun technicalities which, like the gossamer threads in Southey's poem, turn to steel and bind fast the arm of justice; its intolerable delays; the series of traps which it sets for prosecutors, juries and judges, and courts of appeal; the premium which it puts upon crime committed by a rich man able to employ astute counsel who will thread a way to immunity through the tortuous mazes of our criminal practice, thus outraging propriety, making a mock of the law, and reduciug to an absurdity the boast that all men are equal in a court of justice—all this has been exposed and deplored for years. Lawyers have mourned at it. Judges, like Justice Brewer of the Supreme Court, have shown what a shame it is. Reformers have cried out against it. The President of the United States has brought the matter to the attention of Congress. Yet nothing has been done.

What we would ask to-day is whether the long disgrace of the Thaw trial may not work at least the good of finally arousing public sentiment and professional obligation to the pitch of setting

on foot a movement for the reform of this national abuse. Appeal must necessarily be made, above all others, to lawyers. It is their profession, for which they should have a jealous care, that most suffers from the chaotic state into which the criminal law has been allowed to fall. We could wish, therefore, that the Bar Association might speedily move in this matter, if only in the spirit of *pro domo suâ*. And the bench, also, might properly act on the precept of Lord Coke, that he considered every man who had been successful in his profession "under an obligation to benefit society." What greater benefit could any American bestow upon his kind than the removal of the reproach and danger which lie in the working—or failure to work—of our criminal law?

As in all reforms, however, it is to individual leaders that we must chiefly look. A man in whose heart the wrong burns is the source from which impulse flows to organizations and legislatures. No better or more pertinent illustration of this truth can be found than in the career of Sir Samuel Romilly, who did so much for the reform of the criminal law of England. It would be well if a copy of his Diary could be made prescribed reading for every lawyer in the State of New York. Romilly found his spur in the loftier sense of personal and professional duty. In his speech in the Commons in 1811, when bringing in his three bills for the reform of the then hideous criminal practice, he said:

> It is not from light motives that I have presumed to recommend an alteration in a matter so important as the Criminal Law of the land. I have always thought that it was the duty of every man to use the means which he possessed for the purpose of advancing the well-being of his fellow-creatures. My success and my good fortune in my profession have laid me under a debt to the society in which I live; and the way in which I intend to discharge that obligation is by endeavoring to meliorate the law, and thus to increase the security and happiness of my country.

This is not the place to recount Romilly's long struggles and large triumphs. He found the criminal law of England a barbarous code; justice being too often a synonym for horrible cruelty or fantastic caprice; he left it after years of unwearied labors, somewhat more worthy of a Christian nation. The question is whether there are not Americans, like Romilly successful in the law and like him undaunted, who will feel that for them, too, *légalité oblige*, and will give themselves to the work of rescuing our criminal law from the fearful huggermugger into which it has drifted.

To be specific, the whole subject of expert testimony clamors for a thorough overhauling. It is to the clashing of experts in the Thaw trial, and the long wrangles over them, that we mainly owe the inexcusable prolongation of the case for nearly three months. In England, the man Rayner, who murdered the merchant, Mr. Whitely, on January 24, was tried and convicted on March 22. There was a personal scandal involved, as in the Thaw case; there was also the question of the murderer's irresponsibility; but an English judge, under the English practice, strictly enforcing the rules of evidence, and ruling out the vague guesses of insanity experts, brought all to a conclusion in *five hours*. Now, are we to take it out in exclaiming at the contrast with our vicious procedure, or are we to insist upon mending that procedure? American lawyers are prominent in public life. They fill the Legislatures and Congress. Are they going to do nothing to make such a reproach to American jurisprudence as the conduct of the Thaw trial hereafter impossible?

We are aware of the difficulties and discouragements in the way of any reformer of the slow-grown and inveterate abuses of the criminal law. The Commission on the Law's Delays had, in some respects, an easier task, but has been able as yet to accomplish only a part of it. Romilly was often rebuffed and long thwarted. But he returned again and again to the charge, telling the House of Commons: "I am not to be discouraged by the consideration that I have spent a great deal of time on this subject, without doing much good." Similar persistence, we are persuaded, combined with knowledge and energy and persuasive power of presentation, will crown with success the efforts of any honest and able lawyer to reclaim our criminal law, and make it a swift and sure terror to evil-doers.

PROBING SPECULATION BY DIRECTORS.

The Interstate Commerce Commission has declared that it will appeal to the United States Circuit Court for an order requiring E. H. Harriman to answer certain questions which he refused, by advice of counsel, to answer at the February hearing. The lawyers joined issue during the inquiry as to the sale of 103,000 shares of the Chicago and Alton syndicate's stock to the Union Pacific. The Commission's counsel, F. B. Kellogg, asked Mr. Harriman if he himself had owned any of the Alton stock, thus sold to his own company. His counsel, J. G. Milburn, thus objected:

> Who the individuals were who sold to the company is not, that I can see, a pertinent matter with reference to interstate commerce for the scope of this investigation. In other words, I say that there is a line; on one side of that are matters which are related to transactions of interstate commerce that are within the jurisdiction of this Commission. I say on the other side of this line are the private affairs of individuals.

And in accordance with this theory Mr. Harriman refused to answer all other questions as to his personal interest in sales of stock to the Union Pacific. To the question, "Were you directly or indirectly interested in any Union Pacific stocks bought between July 19 [the date when the very large Union Pacific dividend was decided on] and August 17 [the date of its public announcement]?" he refused to make any response whatever. A more general inquiry, as to his personal purchases of Union Pacific stock, drew forth flippant replies—that he had bought it, for instance, after its reorganization, in anticipation of last August's dividend. It was clear that the question of authority to require answers to such inquiries would have to be determined by a Federal court.

Mr. Kellogg's argument in behalf of the Interstate Commission's power was somewhat technical; its gist was that the Commission's enlarged authority over rates, under the Hepburn Act, made inquiry into all circumstances affecting rates a necessity. Inflation of capital by a board of directors, for their personal profit or otherwise, has some bearing on the question of rates. Hence, he maintained, the provision of the Interstate Commerce Act that the Commission "shall have the right to obtain from such common carriers full and complete information necessary to enable the Commission to perform the duties and carry out the objects for which it was created," and that to this end it "may invoke the aid of any court of the United States in requiring the attendance and testimony of witnesses"—this provision would cover these questions as to personal operations of directors. C. A. Severance, in behalf of the Commission, further emphasized the point that the Union Pacific, "having seen fit to depart from the ordinary line of business for which railroad corporations are organized," had gone into the banking and investment business. Yet any unwise or unlucky venture in this line necessarily "weakens or lessens its capacity for future usefulness as a railroad corporation." Hence the propriety of the inquiry.

These arguments appear to us to have much weight—certainly more than Mr. Milburn's rejoinder that "not outside the Orient do such extraordinary powers exist" as the Commission claims. Whatever the technical right or wrong in the matter immediately at issue, the power of inquiry here asserted is not only enjoyed without dispute by Congressional and Legislative committees, but is constantly exercised by them. A contumacious witness goes to jail. Such celebrated Congressional inquiries as that into the "Credit Mobilier" scandal in the original financing of Union Pacific, or that which unearthed the facts of the Gould-Fisk conspiracy in the gold mar-

ket before Black Friday, prove that this right of inquiring into the personal speculations of men in responsible positions is a matter of long-established precedent. It is therefore our conviction that, if the right to insist upon the questions put to Mr. Harriman were to be denied to the Interstate Commission, that right is likely to be asserted in short order by a Congressional committee.

Unless they are guilty trustees, Mr. Harriman and his fellow-directors ought to welcome the full disclosure of all the facts surrounding Union Pacific's 10 per cent. dividend and $130,000,000 stock investments last autumn. These men are aware that suspicion surrounds, and has from the first surrounded, both these incidents. Presumably, they know that Wall Street holds implicitly to the belief that these directors "jockeyed" with the declaration of the dividend; suppressed monthly statements of Southern Pacific earnings which bore directly on the dividend question; fomented, in London and New York, an extravagant stock speculation in connection with Union Pacific's dividend, and eventually, by borrowings for this speculation, deranged the money market and jeopardized the business interests of the country.

We do not say that this Wall Street belief has yet been proved true. But we are certain that Mr. Harriman's refusal to answer certain questions has persuaded a good part of the public that it is true, and we further hold that, if it is, then the time has come to take further steps for the regulation, not of our railway rates, but of our railway directors. Discussion about the propriety of directors' speculating in the Stock Exchange, on secret advance information regarding their own stock, is regarded in many quarters, we are quite aware, as a purely academic dispute, an unprofitable search after counsels of perfection. It is our opinion, however, that, even in those quarters, sentiment has been changing since we have learned the power that four or five men may exercise with a $130,000,000 cash fund. The end towards which such financial power, secretly exercised and unrestrained by law or scruple, must inevitably lead our railway enterprises, ought to be plain to every one who has read the similar chapter in our railway history of forty years ago.

CROMER IN EGYPT.

Egypt without Evelyn Baring, Lord Cromer! The reading world is trying to-day to adjust itself to the thought. It was in 1877 that Major Baring arrived in Cairo, after nearly twenty years in the Royal Artillery and four years of service as private secretary to the Earl of Northbrook, Viceroy of India. Since that time, or at least since 1883, his name has stood for progress in Egypt, for the reform of the courts and of the fiscal system, the practical abolition of forced labor, the development of irrigation, and progress in a hundred other directions. A nation humiliated and impoverished by its rulers, has been set upon its feet and been helped far along the road towards prosperity and self-government. Profiting largely by the British mistakes in India, Lord Cromer has made of Egypt England's greatest success in colonization, or better, administration. Nowhere else the world over has the attempt of a superior race to guide a backward one been on the whole so praiseworthy.

How great the task which fell to Cromer only those can realize who go back to the time when he became British consul, or pro-consul. The Arabi Pasha revolution of 1882 was the sincere effort of an abominably oppressed people to throw off the yoke of a dissolute spendthrift. The foreign bondholders chose to regard it—as many writers do to-day—as merely the mutiny of an unpaid army. Acting for them, England suppressed the rebellion, banished Arabi, and took hold in Cairo. The city seethed with intrigue and discontent. The Mahdi movement grew apace; one great southern province after another fell away, until, with the tragedy of Khartum, the Egyptian frontier was forced back to the Second Cataract. Naturally, the Mahdi had his followers in Cairo itself, who gathered courage from the disputes among the hated foreigners, and particularly from the opposition of the French. For many months Cromer, with a most aggressive foe on his borders, lived in expectation of a fanatical uprising in the capital, and neither in Upper nor in Lower Egypt were there trustworthy troops, save those of the small English garrison.

Still, Cromer's spirit remained undaunted. He left the Mahdi in peace for seven years, while a new Egyptian army —and an admirable one—was built up out of raw material. Finally, after eleven years of planning and waiting, he overthrew the Mahdi's successor, and won back for Egypt her vast Equatorial territory. Meanwhile, the internal reforms had proceeded swiftly. The Barrage below Cairo, like the huge dam at Assuan, became the source of great wealth, while vast schemes for utilizing the waters of the Upper Nile for irrigation are even now under consideration. The fellah became, in the eyes of the law, an equal with the once overbearing and despotic pasha. In an incredibly short time, from a bankrupt state, Egypt became one of the most flourishing countries in the world. This financial transformation was particularly Lord Cromer's work. His first relation with Egypt was as Commissioner of the Public Debt. He found the country running behind each year in a way to make its escape from entanglements seem impossible, particularly in view of the varying opinions among the debtor nations. Just how the way to solvency and prosperity was found has recently been set forth at length by Sir Auckland Colvin, the British comptroller-general in Egypt and financial adviser to the Khedive. Sir Auckland, like Lord Milner, and Lord Cromer's successor, Sir Eldon Gorst, is eager to give Lord Cromer full credit for all he has done. "The making of modern Egypt," says Sir Auckland, "is the work of Lord Cromer; without him it might scarcely have been accomplished, and with his name it will be identified." Beyond all doubt, Lord Cromer, who is now sixty-six years old, has won for himself imperishable renown as among the greatest of England's long line of distinguished administrators.

And yet it is noteworthy that his retirement coincides with a period of great unrest along the Nile, with the demand for Egypt for the Egyptians more outspoken than ever before. Each month shows that the movement is, if anything, steadily growing stronger. Thus Sir Eldon Gorst faces a new problem, different from the old, more delicate and difficult of settlement. True, Lord Cromer has gradually increased the share of the Egyptians in their government. Their constitution comprises a Legislative Council and a General Assembly, and no law or decree calling for administrative changes can be promulgated without the Council's consent. A greater share in local administration is being granted to the natives. Yet much remains to be done. The courts have still to learn to apply the law with judgment and discrimination; indeed, as the *Edinburgh Review* said recently, "until these questions have been settled, it cannot be said that the protection of life and property in Egypt is efficiently assured." That the native has small chance in the criminal courts when opposed by Englishmen, Wilfrid Blunt and others have recently asserted.

Indeed, it may be asked whether Lord Cromer's wonderful success may not become the best object-lesson the world has had, that no government, however admirable, is so good as self-government. The powers which the native Egyptians now enjoy, instead of contenting them, simply make them long for the rights and privileges of the self-governing nations of Europe. This, indeed, is the instinct planted deep in the human heart. Lord Cromer himself has shown great nervousness—now explained, perhaps, by his physical condition—over the situation. His shockingly harsh and really illegal punishment of the natives who attacked British officers at Denshawei is proof that even this notable administrator, at the end of his career, ruled by force rather than by affection, and felt it necessary to main-

tain the prestige of his nation by mediæval cruelty. Doubtless, the debate as to whether Lord Cromer has been a benevolent despot or an iron-handed autocrat and oppressor, will go on indefinitely. But his fame is securely established as one of the great men of our times.

A UNIVERSITY AT WASHINGTON.

Just now a new claimant for intellectual headship among American cities is appearing. A movement is afoot for capitalizing, under private initiative, the immense apparatus of scholarship at the national capital. All roads lead to Washington; and so let New York, Chicago, Boston, and even Indianapolis, drop into provincial obscurity while the nation acclaims Washington as the ideal residence for the literary man, the scholar, the scientist, the jurist, the student of diplomatic relations, for whoever, in short, leads the intellectual life. A national university, embodying the conceptions of the founders of the republic, is, we are told, at last to be created. The scientific, historical, and literary treasures of governmental museums and archives are to be rendered accessible as never before to candidates for university degrees.

The promoters of the George Washington University movement are much in earnest. They are now closing a campaign for providing a suitable site. They are seeking no Congressional help, but their endeavor is to enlist the sympathies and coöperation of the entire country. Nationally prominent men, including the President and the Secretary of the Treasury, have expressed approval of the scheme. Reasons are being advanced by speakers at public meetings why Washington, already a considerable social centre, should also become the intellectual capital of the United States. In most lands, it is asserted, the seat of government contains the greatest, and in many instances the only great university. The energetic director of the Bureau of American Republics tells of meeting a Hindu potentate at the Delhi Durbar, who announced his intention of sending his son to Harvard because he wished him to have the advantages of life at the American capital, but who, when informed that the only American university with whose name he was familiar was situated nearly 500 miles from Washington, was immediately shaken alike in his determination and in his admiration of American good sense. An impressive exhibition, in fact, of arguments in favor of doing in this first decade of the nineteenth century what members of the Constitutional Convention of 1787 wished to do, and what the first President sought to accomplish through his will and testament, is being set forth.

Out of the present agitation Washington seems likely to secure a university of distinct importance, devoted in the main to graduate study of a highly specialized character. That in number of students or magnitude of private equipment it will be on a footing with longer established institutions of learning, may be doubted. Its opportunity will lie in pushing the development of facilities which cannot be duplicated elsewhere. In certain branches of study it may easily outrank all other American universities; in such subjects, indeed, as diplomacy, international law, American history since 1800, meteorology, and the application of the physical sciences to agriculture, it seemingly must lead all others.

The ambitious university at Washington will not need a large acreage, with an array of museums and libraries, because these the national Government has established. Indeed, according to report, the university will be relocated on a tract of rather less than ten acres—land enough, no doubt, for such headquarters as are necessary where students do much of their work outside. In contradistinction, however, Harvard University now occupies, exclusive of lands held for investment purposes, 542 acres. The Harvard Medical School alone occupies a site of twelve acres, considerably larger than the property proposed for the George Washington University. Yale has an acreage somewhat smaller than that of Harvard; and Columbia, situated in the metropolis, where land cannot be held for the purposes of an agricultural college or of a museum of living trees, covers a tract of nearly thirty-five acres. Chicago University's troubles arising from inadequate space in which to develop were allayed only by the gift, two or three years ago, of about sixty-five acres frontage on Lake Geneva.

But when Washington has its university, what of New York, Philadelphia, Boston, and other important centres of population? Professors of Columbia and Harvard and Yale will hardly migrate in a body to Washington. Nor will the institutions of our large cities be henceforth devoted solely to undergraduate work, leaving the fields of special research to be cultivated at Washington alone—not while the museums, libraries, and laboratories of several great communities offer to students exceptional facilities, many of which are by no means duplicated in governmental departments. We must remember that, exacting as the teaching profession is, the research instinct is normally strong among scholars. Facilities offered in New York or Boston tempt the studious just as the resources of Washington are tempting. Moreover, utilization at one centre furthers utilization at all the others. The sections from which an important university at Washington will be most likely to draw its students are the West and South. As the result of an increased disposition to seek educational opportunities as far East as the District of Columbia, many a student will find his way for a year or two at Johns Hopkins, Columbia, or Harvard, who but for the attractions of the capital city would never have gone beyond the senior year of the little provincial college in Texas or South Dakota. Thus, with scholarly assets already well developed and with comparatively few liabilities, the other leading American communities can afford to regard with friendly interest and without jealousy the present movement to secure an educational capitalization of the Smithsonian Institute, the National Museum, the Department of Agriculture, the Bureau of Standards, the Congressional Library, and all the other working laboratories of the National Government. For the existing federation of intellectual capitals of the continent is certain to persist.

COLORLESS PROPER NAMES.

There is a fascinating if considerably discredited branch of philology in which the facts of language are, in the absence of other documents, made to imply the facts of history. Many of us preserve from college days a complete and engaging picture of that Aryan race which descended from the plateau of Iran to rule the world, and that linguistic pastoral still imposes itself in the face of a more skeptical science. Now, a philologer who studied the development of proper names from this point of view would not fail to note their melancholy tendency to bleach out in the wearing. At any early period, and indeed well towards the beginnings of modern history, proper names told something as to paternity, occupation, and habitation: to-day they are quite colorless. A new Ulysses would no longer be Laertides; no Peter indicates that he is the son of Paul. A Carpenter or a Weaver is likely to be a lily-fingered stockbroker. Even the place names have pretty much disappeared, except in the case of nobility, and since the average gentle family has not for years lived on its titular estate, or perhaps has had none at all, our new Gastons de Foix give us a name about as sapless as John Jones.

A social philosopher who should generalize fearlessly from these facts would probably infer that about the end of the Middle Ages filial affection lost its force. At about the same time he would find life became so mobile that the professions and handicrafts no longer descended from father to son, a plebeian Wright becoming a bourgeois Mercer, or even an aristocratic Chamberlain, without even taking the trouble to change his name. Then our philologer would assert that men became wanderers on the face of the earth, so that it was no longer worth any one's while to call himself

John of Paris or Robert of Lincoln. Thus no new place names were invented, and the old gradually became misnomers. If history were interpreted in this light we should have, in short, a progress towards ruthless individualism, a general renunciation of all the venerable ties of birth, home, and calling, so that names became actually less significant than the police ticket carried by the thoroughly regimented citizens of France and Germany. Having small skill either in philology or ethnology, the *Nation* does not wish to make itself responsible for this teaching in its entirety. It would merely note the fact that proper names have bleached out, and remark a tendency in naïve romantic quarters to restore the original colors.

This effort to rehabilitate a debilitated onomasticon is quite in the normal order of things. Just as once in a while some human being obligingly grows a tail to prove that we all had them once, so the real children of nature will on occasion rebel at the mere label and make it into real name, bringing it back to type. In sporting circles this is commonly the case. The Brompton Pet is merely one instance among many. Our betting ring had, perhaps still has, a Pittsburgh Phil. Mining camps, in sheer desire to cope with their miscellaneous population, rechristen all inhabitants of any prominence after their homes, or places of last departure. In this process literature gladly follows life. The dime novel presents only such titles as Klondike Kit, Bowery Bill, or Saratoga Sal. When the dime novel grew in bulk and repute it sacrificed merely the meretricious grace of alliteration. We were thrilled by Mr. Potter of Texas, Mr. Barnes of New York, and a host of imitators—all of no mean city. With a better warrant, hero-worship seeks pregnant names—Kitchener of Khartum, Tippecanoe, Stonewall Jackson, Ossawatomie Brown. The principle seems to be that whenever the mere family label is inadequate, a more honorable or descriptive title replaces it. Among boys, who in this matter repeat the history of the race, a whole category of honorifics prevails.

Whenever for any cause the baptismal name becomes unavailable, one may see the reversionary process actively at work. In Italy, for example, where the native servants cannot remember or even pronounce the foreign names, all expatriates soon gain a handier denomination. One is announced as the Gentleman from San Domenico, or the Via Ricasoli, as the Sympathetic Redhaired Gentleman, as the Tall Wife of the Short Signore, the Signorina with the Fur Hat, the Lady with the Automobile, or whatever characteristic or attribute happens to strike the keen Italian eye. Sometimes these nicknames shift according to circumstances, illustrating the celerity with which such epithets as Light Horse Harry, or, better, Charles the Bald, were coined. A certain Italianate Englishman, accustomed to hearing himself announced at a hospitable villa as the "Longhaired Gentleman," was surprised one evening to be received as the "Longhaired Gentleman, but now it's short." So was well-doing ever rewarded in the good old days when names still had color.

PARIS BOOK NEWS.

PARIS, April 2.

"Lettres de jeunesse"—the first of the three parts of Émile Zola's correspondence—is the book of the season, not from intrinsic merit, but because of the writer More than one-half of the volume is presented under the bare title of "Lettres à Baille," dated from the writer's twentieth to his twenty-third year after he came up to Paris from his college at Aix in Provence. Then follow eighty pages of letters of the same years to Paul Cézanne, who is Cézanne the painter. Finally, there are short, scrappy letters to Marius Roux, with whom he attempted theatrical collaboration; these reach from 1864 to 1872, and bring us to the Zola who was beginning to be known as an acrid defender of new men in art, like Manet. But the volume discloses practically nothing of the mind of the man who was to find Naturalism. On the contrary, it is an unknown Zola that appears copiously in these letters to college friends who shared with him the dreams of his teens. Literary ambition is the keynote, but Zola's particular ambition is lyric poetry. In his efforts to pass the University examinations in Paris he remains under the influences which began his mental formation when a boy. His inspired prophets are Michelet and George Sand, with Montaigne as he grows older; and to his friends who are still on the benches, he writes endless continuations of Sainte-Beuve's criticism. So far no Flaubert, no Taine, has crossed his path; he believes in God, and Ary Scheffer is his chosen painter. He laboriously expatiates on Shakespeare; his style has little rebound even when he is most lyrical about sylphs and veritable, complete love and the like; and he corrects realism by "spiritualism," which we call the Ideal. All has been edited without comment.

Several March books bear with varying importance on present politics. "La Conférence d'Algésiras," by André Tardieu completes the sensational article in the *Revue des Deux Mondes* which first authentically disclosed "the hidden springs of the Franco-German conflict." In the Paris *Temps*, to whose staff he belongs, this same author, during the negotiations, published frequent articles signed "Georges Villiers," which were evidently inspired by the French Foreign Office. This virtually official character gives its value to the book. Since its publication the author has answered at length in the *Kölnische Zeitung* (March 30) certain criticisms made in Germany, with a final reply in the Paris *Temps* (April 1); the Cologne journal's chief reproach is significantly that he has limited himself to "stating facts exactly" instead of "discussing the interpretation of them."

"Le Vingtième Siècle politique (1906)," by René Wallier, is the annual review of French politics in the series begun in 1874 under the name of "André Daniel" (ex-Minister André Lebon). The year's Presidential and Parliamentary elections, the separation of Church and State, new social laws and strikes, the budget, the official winding up of the Dreyfus case, and the Moroccan question are treated readably, with full citation of documentary reports. The tendency of the book may be described as moderately Radical. "Luttes pour la liberté de l'Église Catholique aux États-Unis," by G. André, a priest, relates summarily how Roman Catholics in America remedied the bluuders of legislation imposing an unfavorable trustee system on their churches. This is for Frenchmen, whose public worship associations have failed so disastrously among Catholics. But it would be well if the whole subject, from the point of view of international comparison, could be handled in a complete university thesis on the Constitutional question. "Autour du Catholicisme social" is a volume of essays written mainly for the *Revue des Deux Mondes* under the Brunetière régime; the author, Georges Goyau, and his wife (daughter of President Félix Faure) are leading writers of the more modern school of Roman Catholics in France.

In books of history the Revolution is always to the fore. The first volume of the Memoirs of the Comtesse de Boigne, *née* d'Osmond, has gone through five editions in less than that number of weeks. This wide-awake lady, unbiassed by charity or principle, and curiously without emotion, like so many of her class, was grown up when the Revolution broke out, escaped the fate of most of her friends by a discreet emigration to England, and survived almost into our own times. She tells too good a story to be always accurate; and Chancellor Pasquier, a survivor like herself, to whom she confided her manuscript, would not consent to its publication; his heir, the Duke-academician d'Audiffret-Pasquier, allowed Taine to consult it; and now the d'Osmond family takes on itself the responsibility of its publication. The present instalment reaches from 1781 to 1814. In "Lettres d'aristocrates," Pierre de Vaissière edits exact contemporary testimony of "the Revolution as recounted in private correspondence" during the fateful years from 1789 to 1794. "Les Fils de Philippe-Égallté pendant la Terreur" is the second number of G. Lenôtre's documentary Memoirs and Souvenirs of the Revolution.

Frédéric Masson of the French Academy has published the eighth and ninth volumes of his work on "Napoléon et sa famille." In a recent letter he denies that the documents from which he has taken the matter of his extraordinary series of perhaps thirty volumes on Napoleon have been furnished to him by the family; he will disclose his sources when the time comes to do so. The present volumes take up the abdication at Fontainebleau and Napoleon's solicitude to extort ample provision for all the members of his family, none of whom seems to have been troubled about Napoleon's fate. The whole family had but one fear—"that the allied Powers

would oblige them to go to the island of Elba, and would make this a condition of the income to be assigned them." Joseph and Jérôme tried to run off with Marie Louise as a hostage. Jérôme writes to his sister Elisa: "The Emperor, after bringing ruin on us, outlives himself—he is no longer the same man." Meanwhile, Napoleon, in the agony of his Empire, was holding out for a million of francs a year for Josephine, 400,000 for Hortense, 300,000 for his mother—and so on to 500,000 each for Joseph and Jérôme. M. Masson works out to the last documented item this tragi-comedy wherein Napoleon was so great and the Bonapartes so little.

For those interested in military history there is, in the General Staff publications, the fifth volume of "L'Expédition d'Égypte," by C. de la Jonquière, centring in the victory of Aboukir and Napoleon's return; and two volumes of an "Étude sur les guerres d'Espagne," by Commandant G. Bagès, from the French invasion to the evacuation through Portugal, with the operations of Soult and Wellington. Both these works are amply furnished with technical plans.

In the history of art should be noticed the expensively engraved "L'Art byzantin," of which the third number has appeared—Pomposa and Ravenna. In Italian "Le Origine della pittura veneziana," by Lionello Venturi, has been crowned by the Royal Institute of Arts and Sciences of Venice; it is the first history of Venetian painting.

In the history of literature a subject of vast importance in every region of thought has been twice treated: "Le Romantisme français," by Pierre Lasserre, is an essay on the revolution in feelings and ideas during the nineteenth century; "Byron et le romantisme français," by Edmond Estève, university lecturer at Poitiers, is a thesis for the doctorate of letters on the fortune and influence of Byron's works in France from 1812 to 1850. Paris also publishes two volumes in Spanish on Spanish-American writers at the beginning of the twentieth century, under the title of "Los Contemporaneos," by Andres Gonzales Blanco.

The output of fiction under known names, or by writers that give promise of making themselves known, is scanty. Édouard Rod publishes "L'ombre s'étend sur la montagne," pensive and refined like all his works, but, like them, chilled with the dry cold of Calvinism; still this Swiss Parisian has undoubtedly reached all but the very first rank of French novelists. "La Terre ensorcelée," by Jean Vignaud, is the second, perhaps third, book of a writer who speculates socially to some purpose and promises much for future novels from his hand.

Finally, there are a few books of very special scope, but not without interest for a very general class of readers. "La Philosophie de M. Sully Prudhomme," by Camille Hémon, reduces to convenient compass and system the speculations of one who is a thinker as well as a poet. "Les Quatres Évangiles," by Albert Metzger, is a collection of texts and documents constituting materials for the history of the Oriental origins of Christianity. "Essai critique et théorique sur l'association en psychologie," by Dr. Paul Sollier, the authority on nervous diseases and drug addictions, gives experimental philosophy from his point of view. S. D.

Correspondence.

ARCHÆOLOGY AND LITERATURE.

To the Editor of The Nation:

Sir: May I venture as one interested in archæology, and—to admit a further weakness—in prehistoric archæology, to criticise two statements in your correspondence of March 28? The first, by Prof. F. G. Allinson of Brown University, is to the effect that archæology is the handmaid of literature; the second, by Pr. W. N. Bates of the University of Pennsylvania, gives a classification of Mycenæan and Cretan palaces, which is to me unintelligible, although I have spent five seasons in excavating and in studying the excavations of others in Crete.

To deal with the general statement first. Professor Allinson writes: "But to one that estimates literature at its true worth, philology and archæology are only handmaids." If this be so, what becomes of American archæology and of the prehistoric archæology of Europe, which have no literature that is as yet legible? Would Egyptian antiquities have no lesson to teach us if the Rosetta stone had never been deciphered? Although Professor Allinson's view was common enough in the earlier days of antiquarian research, no archæologist worthy of the name would be content in this twentieth century to have his labors classified as adjuncts to literature, even to classical literature. He would think the beautiful crater in the Bibliothèque Nationale deserved study even if no literary tradition existed to inform him that the figures represented on it are Poseidon, Amphitrite, and Theseus. His labors play an independent part, and have their own field distinct from that of literature. This was clearly recognized as early as 1850 by Sir Charles Newton, whose essay "On the Study of Archæology" begins with the significant words, "The record of the Human Past is not all contained in printed books." There is another record to be read in form and in color, and in the adaptation of practical means to an end, and Dr. Karl Sittl has emphasized the special qualification needed to interpret it: "Whoever wishes to be an archæologist must above all else be able to *see*." This record is no mere elucidation of the written word. Man has expressed himself as clearly and as worthily in the work of artist, artisan, or inventor as in his literature; indeed, at the present time he is expressing himself far more clearly and worthily through the visible, tangible things that, when past, form the subject matter of archæology (τὰ ἀρχαῖα), than he is in his literature. It is by the archæologists of future generations that this present generation will be vindicated, not by the students of literature. For, to quote Sir Charles Newton again,

> Wherever man has left the stamp of mind on brute matter; whether he designate his work as structure, texture, or mixture, mechanical or chymical; whether the result be a house, a ship, a garment, a piece of glass, or a metallic impiement, these memorials of economy and invention will always be worthy of the attention of the Archæologist. . . . Our true motto should be "Homo sum, humani nihil a me alienum puto."

It is clear that archæology is closely allied to anthropology, is indeed included in it in the wider sense of that science which is "the proper study of mankind." This fact is recognized in England, when archæology gains admission to the sessions of the British Association for the Advancement of Science by being classed under anthropology. We have too long limited it to classical fields. Dr. Montelius in a recent book is careful to state, "By Archæology I understand not only the study of classical antiquity (*klassische Alterthumskunde*), but, in accordance with its etymology, the study of antiquity in general." Possibly through the instalment of archæology as a fit subject of study in our universities, there may ultimately come an interest as broad and cultural in the arts and industries of the *present* as there now is in modern literature, both properly based on knowledge of the past. This seems to me to be the true purpose of archæology, and its hope.

To turn from the general to the particular: I wish that the meaning of Dr. Bates's interesting communication might be made clearer. He tells us that "Mycenæan palaces are of two types; the Cnossus type and the Tiryns type"; and that Dr. Dörpfeld considers the building he found last spring at Alt-Ithake (modern, Leucas) to be of the Cnossus type. This seems strange, in view of the fact that Dr. Dörpfeld agrees with Cretan excavators that the remains *now visible* at Cnossus are "old Cretan" (*altkretische*), or, as might also be said, genuine Cretan (*echtkretische*), distinctly *non*-Mycenæan.

Is Dr. Bates using the term Mycenæan in a general way to cover Prehellenic antiquities? He must be aware that this usage is out of date, now that research has firmly established the fact that in time and in importance the island civilization as developed at Cnossus is prior to the mainland civilization as seen at Mycenæ. When the Cnossus type of palace is mentioned, one naturally thinks of the vast structure Dr. Evans has laid bare, comprising a great central inner court, around which are grouped countless rooms, corridors, stairways, whole suites of apartments, bathrooms, light-wells, etc., which are the essential parts of an "old-Cretan" palace. Among these there is no great hall or *megaron*, which, according to Dr. Dörpfeld, is the characteristic feature of a Mycenæan palace. Does Dr. Bates mean that there are two types of prehistoric palaces in Greek lands, the Cnossus type (Cretan) and the Tiryns type (Mycenæan), and that the building found at Leucas resembles the former? If so, the discovery is indeed important, overthrowing Dr. Dörpfeld's contention that "Homeric palaces have no resemblance to the 'old-Cretan' buildings, but agree with the Achæan palaces of Tiryns and Mycenæ," or else proving that the building at Leucas is not the house of Odysseus, or that Odysseus, who is usually accounted an Achæan of the Achæans, did not live in an "Homeric palace."

But a few persons who read Dr. Bates's communication will remember that evidence afforded by scanty remains in the southwest corner of his excavations led Dr. Evans to reconstruct on paper a *megaron* supported by walls and pillars which are still *in situ*. This *megaron* Dr. Evans believes to have belonged to an upper story, now vanished, of his Minoan palace; but

Dr. Dörpfeld thinks it formed part of a later palace of Mycenæan style, built by Achæan invaders. In certain details of proportions and numbers of columns the Mycenæan style, which Dr. Dörpfeld finds as a late intrusion into Crete, differs from the Mycenæan style of the mainland. Does Dr. Bates mean, then, that the house of Odysseus resembles this sub-type of the Mycenæan palace, having the characteristic *megaron*, but one that is wider than it is deep, with a one- or three-columned arrangement of façade, instead of being deeper than wide, with a two-columned arrangement of façade, like the palace at Tiryns? If this is his meaning, one wonders why he did not use Phæstus instead of Cnossus as his sub-type; for Dr. Dörpfeld himself says that of the later palace of Mycenæan style which he believes to have *once* existed at Cnossus so little remains "that neither its measurements nor its plan can be determined," and its *megaron* is reconstructed after the model furnished by the Italian excavations at Phæstus. To be sure, the *megaron* of Mycenæan type which Dr. Dörpfeld sees at Phæstus is interpreted by Dr. Mackenzie as a characteristically "old-Cretan" arrangement of portico and light-well; and, while the matter is still in dispute, it would seem to some persons dogmatic to speak of a Phæstus type of Mycenæan palace. But all who are acquainted with Dr. Dörpfeld's views would know what was meant. As questions of race-migration as well as "difficulties in the account of the slaying of the suitors in the Odyssey" are involved, may we hope to have from Dr. Bates a more exact statement of what he learned from Dr. Dörpfeld concerning the resemblance of the building he has found at Leucas to ancient buildings on Cretan soil?

In the interests of clearness, "Mycenæan" as a chronological term should be carefully limited to the last phase of the Bronze Age, the only one at all adequately represented at Myeenæ. The new term "Minoan," advanced by Dr. Evans, has a wider content; for Cnossus, the capital of King Minos, was inhabited from the beginning to the end of the Bronze Age, and "Minoan" may be considered a picturesque equivalent of an adjective applicable to the entire Bronze Age of Greek lands. For convenience, Cretan excavators now use the terms Early Minoan, Middle Minoan, and Late Minoan, to denote periods of time which are roughly contemporaneous with the Old, Middle, and New Empires of Egypt. In point of time, therefore, Mycenæ is Late Minoan. As regards types of architecture, by "Mycenæan" is meant a type having *megaron*, fore-hall, portico, and court, which prevailed on the mainland of Greece at the close of the Bronze Age, and was introduced into at least one island, Melos. Whether it was introduced into Crete is, as we have seen, a matter of dispute, but if so it can only be studied at Phæstus. HARRIET BOYD HAWES.

New York, April 8.

TO THE EDITOR OF THE NATION:

SIR: In your issue of March 28, Francis G. Allinson concludes his discussion of "Literature and Philology" by saying: "To him that estimates literature at its true worth, philology and archæology are, after all, only handmaids." This statement does not, it seems to me, cover the whole ground. A philological investigation may issue in a result "ancillary to the needs of literature," but it rarely does. Grimm's Law is the greatest discovery yet made in philology, but has it anything to do with literature? English philology, to speak of the philology of a single tongue, became possible only when men realized that the English language had an individuality of its own, certain inner principles of growth and decay, that conditioned its evolution. Philology is not possible so long as men look on language as a bundle of imposed laws. As soon, however, as language is viewed as a development from within, reflecting at the same time the needs, the limitations, the intellectual gait, the racial contacts, the cross-fertilizations of a people through many centuries, its philology assumes the dignity of a science.

This science may contribute to literature, but this is by no means its only or even its primary function. Its first duty is to find and to correlate the laws of its own growth. Botany would still be a science if it contributed nothing to our æsthetic appreciation of flowers, because botany illustrates certain principles of nature, laws of life and growth, which it behooves man as man to know. The recognition of these laws brings its own reward and proclaims its own worth.

English philology to-day, as exemplified in doctoral dissertations, is at its very nadir of dryness and irrelevancy. It shows no sense of relative values, no discrimination between the essential and the unessential, and no feeling for constructive generalization. *Son centre n'est pas au milieu.* Counting has taken the place of weighing. "It is an old and firm conviction of mine," wrote Darwin to J. D. Hooker, December 21, 1859, "that the naturalists who accumulate facts and make many partial generalizations are the *real* benefactors of science. Those who merely accumulate facts I cannot much admire."

C. ALPHONSO SMITH.

University of North Carolina, Chapel Hill, April 1.

TO THE EDITOR OF THE NATION:

SIR: Nobody is likely, one may suppose, to deny the contention of Mrs. Hawes that archæology has long since established its place as an independent science. This was *un fait accompli* before she made her own important contributions, of which her countrymen—even heretical ones—are justly proud. My communication to the *Nation* of March 28, while incidentally combating the suicidal tendency to underestimate the worth of philology, was concerned with the real evaluation of literature; and in speaking of the content of archæology as ancillary to literature, reference, of course, was had to the monuments of those peoples who, fortunately for us, have also left us a still greater legacy in their literature.

Between those who have little interest in literature as such, and those who regard it as of primary importance, there is a great gulf fixed. There are many sciences, and their interdependences are manifold. Comparative philology, as a well-known biologist recently remarked, blazed the way by its method for comparative anatomy; and to-day the lecturer on languages in his turn draws striking illustration from comparative anatomy. But when literature is made subordinate to any science, one is tempted to point out that it occupies a different sphere, and, to repeat the words of F. W. H. Myers:

> The highest use of language, the highest use, one may say, of history itself, has been to bestow a few thousand lines of poetry, for which *all other study of bygone ages* is but practice and preparation.

FRANCIS G. ALLINSON.

Brown University, Providence, R. I., April 14.

TO THE EDITOR OF THE NATION:

SIR: The statements in my letter of March 28, to which objection is taken, are Dörpfeld's own. When he used the word Mycenæan—which, by the way, was correctly used—I presume he had no more idea of committing himself to any theory of the origin of Cretan building than I had in quoting him.

As to Mrs. Hawes's communication as a whole, it should be remembered that fact is one thing and theory another; and that the latter should not be mistaken for the former. WILLIAM N. BATES.

University of Pennsylvania, Philadelphia, April 14.

THE HITTITES AND PELASGIANS.

TO THE EDITOR OF THE NATION:

SIR: The recent reading of Drerup's "Homer" and an examination of the literature therein cited reminds me once more of an omission that I cannot help but regard as remarkable, particularly in view of the fact that I have noted the same omission in almost all the books dealing with prehistoric Greece. I refer to Father De Cara's "Gli Hethei-Pelasgi." Its three volumes aggregate about 1,750 large octavo pages. The first was published in Rome in 1894; the second and third in 1902. As one would infer from the title, this erudite work is an attempt to prove that the Pelasgians were Hittites. The author does not go so far as Dr. Campbell, who found Hittites scattered over almost the entire habitable globe; nor perhaps as far as Professor Sayce. But he does maintain that he has found Hittite remains on the eastern and southern shores of the Black Sea, all around the Ægean, and as far eastward as the Euphrates, in Cyprus, in Crete, almost all over Italy, and sporadically elsewhere. Whether the author's contention be right or wrong, he has made a very interesting book. He seems to have read everything ancient and modern that promised to shed the faintest light upon the subject of his inquiry. Notwithstanding his erudition he has his matter well in hand, so that his volumes are not only interesting, but agreeable reading as well. As might be expected, he relies to a considerable extent on etymologies to prove his position. Of these, it may be said that if they are no better, they are no worse than many that were regarded as strictly *en règle* a score of years ago. Dr. Menge sums up the situation in the Preface to his recent "Griechisch-Deutsches Schulwörterbuch" with the remark that "wir, trotz aller gewonnen Ergebnisse heutzutage auf etymologischem Gebiete, ungleich weniger wissen als man vor dreiszig oder gar vor fünfzig Jahren zu wissen wähnten." Here is Father De Cara's explanation of the word Pelasgi: Pel- signifies in Hamitic *advena*. Ati and Asi are equivalent to Khati, which

means Asia; that is, Khatia, the land of the Hittites, or Asia; and Pelasgi, that is, Pelatiki, are therefore foreigners from Asia. He finds the same syllable in Pelation, Velatri, Eretria, Elatia, Ferentinum, Platææ, Plothia, Latium, Latini, and in many other words.

So far as I am aware, the excavations in Crete and elsewhere that have been made since these books were published have revealed nothing that stamps the learned Jesuit's hypothesis as untenable. I have, however, not seen any reference to it in any German or American publication, and only a few in French and British periodicals.

Athens, O., March 30.

PREVAILING USAGE.

TO THE EDITOR OF THE NATION:

SIR: Advocates of the theory that prevailing usage is necessarily good usage must find their faith sorely tried in a democracy of eighty million newspaper readers. About once in a year the fashion of some grotesquely perverted idiom sweeps the country from Maine to California, and then settles down into an established usage. "Stand for" has completely ousted "tolerate" or "endure." "Equally as good as" was only confirmed in the favor of its votaries by the ironical quotation-marks of the *Nation*. If the *Nation* used it so often, it must be right. And now comes, "predicate." The old-fashioned text-books used to warn us not to confuse "predicate" with "predict." But about two years ago some amateur of "foine language" blundered into the employment of it as a synonym of "base." And now every proposition is "predicated upon" something, and every tub is predicated on its own bottom. I thought that the limit had been reached when the Chicago *Chronicle* the other day spoke of the lawyers in the Thaw case as introducing certain documents in order to "lay a predicate" for subsequent testimony. But worse was in store. The President of the United States in his letter of April 11 to the trustees of the Carnegie Institute writes: "The success of our Republic is predicated upon the high individual efficiency of the average citizen." Alas for Harvard! No wonder that the genial Professor Lounsbury bids us not to strive or cry, but bow to the will of the majority.

PAUL SHOREY.

University of Chicago, April 12.

HARRIMAN AND THE FUTURE.

TO THE EDITOR OF THE NATION:

SIR: It is perfectly true, as you imply in your diagnosis of the case of the Harrimans and the "would-be Harrimans," that it is idle to denounce Harriman the individual and ignore the fact that he is but a conspicuous representative of a large class who would follow in his footsteps if they could. But when we have given due attention to this class, may we not go a step farther and inquire into its social significance and also into the cause of this money-madness which has so infected our people as to become a national disease and revolutionize our ideals? According to the latest popular catechism, the chief end of man is to get rich; and the ideal of to-day is, not the man who has the highest intellectual and moral character, but the man who amasses the greatest fortune in the shortest time.' His methods are of no particular consequence so long as they do not land him in jail. Now is this state of things something surprising and unaccountable or is it something that might have been expected to grow out of our social and political theories, and especially from the theory of the absolute equality of all individual social units? Some forty years ago an eminent Swiss writer, Henri Frédéric Amiel, speaking in his "Journal Intime," of the ideals of that time, said in substance and effect:

> The Americans are on the road to revolutionize these ideals by the introduction of the democratic principle of the equality of individuals in a general equality of functions. In this they are seeking to realize a higher social ideal, but the results will be disappointing if not disastrous. For when this principle of equality has been carried to its logical conclusion, and there is nothing left but a multitude of equal individuals—neither young nor old, neither men nor women, neither benefited nor benefactors—all social difference and distinction will turn upon money. The whole hierarchy will rest upon wealth; and as this wealth must, through the operation of individualism, necessarily be very unequally distributed, the inevitable result of this passion for equality will be, not what it is seeking, but the most hideous and most inhuman of inequalities. What a result! Plutolatry—the worship of wealth—the madness of gold. To it will then be confided the task of correcting false principles and their followers, and of shaping the destinies of a people.

The completeness with which we have fulfilled this prophecy seems to show that this disease is not sporadic, but the general and natural product of existing conditions. If this is so, perhaps this prophet can tell us more of our future. He continues:

> But such a régime cannot be permanent. Since plutocracy always rests upon inequality it is necessarily at war with the principle of equality and one or the other must give way. In this struggle it is easy to read the fate of plutocracy. The wealthy few who constitute a plutocracy can exist only through the sufferance and support of the impecunious many, and that support will be given only so long as it fails to comprehend its burdens. When it becomes fully cognizant of the inequalities by which it is burdened, it will withdraw and leave the principle of equality to again assert its sway by tearing down and clearing away the oppressive social fabric of inequality which has been erected by unbridled individualism while falsely flying the flag of individual equality. The ideal equality will then be sought in the opposite direction by circumscribing the activities of the individual in an iron framework of social organization and repression. Thus will be witnessed the strange and self-contradictory phenomenon of Anglo-Saxon individualism developing into and producing Latin Socialism.

Our chief, if not our only, hope lies in the possibility of a moral uplift which will eradicate or permanently put to shame this wolfish rapacity which thus strains the principle of individualism to the breaking point and forces the inevitable reaction. So long as we remain on the moral plane which measures all values by the money standard; which produces and countenances the Harrimans and the would-be Harrimans, and places in their hands great public franchises to be held and manipulated by them for their own purposes as private property, and which hails as the popular hero the most successful exploiter of the property of others—so long will the great social pendulum continue to swing back and forth between a harmful extreme of individualism on the one hand and an equally harmful extreme of collectivism on the other.

HERBERT L. BAKER.

Detroit, March 30.

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: It was doubtless from a chivalrous desire to compensate Cambridge for the persistent tendency of the press to ascribe all things to Oxford that your reviewer of Mr. H. W. Garrod's "Religion of All Good Men" (March 21, p. 270) described him as a Cambridge tutor. But in point of fact Mr. Garrod is a tutor of Merton, and Merton is the most ancient of the Oxford colleges, and unlike many, such as the neighboring institution from which I write, it has not even a double in Cambridge to account for the confusion. In view of Mr. Garrod's contentions, it may further be worth noting that Merton is the college of Mr. F. H. Bradley, and that it possesses at present the unique distinction of having not a single cleric on its governing body.

F. C. S. SCHILLER.

Corpus Christi College, Oxford, April 1.

Notes.

Valuable additions are preparing to the Cambridge English Classics (Putnams). Among these are Gascoigne's Poems, edited by Prof. J. W. Cunliffe of McGill University; the Poems of Giles and Phineas Fletcher, edited by F. S. Boas; Butler's "'Characters' and Other Prose Works," the greater part of which is now first printed, and Prior's "Dialogues of the Dead," both edited by A. R. Waller; Raleigh's "Shorter Works in Poetry and Prose" and Harrington's "Commonwealth of Oceana," edited by Dr. J. R. Tanner; Bunyan's "'Pilgrim's Progress' and 'Grace Abounding,'" edited by Dr. John Brown.

The facsimile edition of "The Pearl" is to be published forthwith for Professor Gollancz by Chatto & Windus. It is to be followed by a "Facsimile Series of Pre-Tudor Texts," also edited by Professor Gollancz.

To the new edition of Austin Dobson's "Henry Fielding" in the English Men of Letters Series, which Macmillans are publishing, a fourth appendix has been added, dealing with the fresh information in regard to Fielding's pedigree, his student life at Leyden, his first marriage, his family, his library, his will, and other minor matters.

The first two volumes of "The Cambridge History of English Literature," which were planned for publication this spring, will not come out until the autumn.

The best book of the kind we have seen, both for its simplicity and its comprehensiveness, is W. S. Booth's "Practical Guide for Authors" (Houghton, Mifflin & Co.). It is in reality an excellent "style-card" for printers and proof-readers, as well as a book of directions for writers.

The excellent one-volume edition of the "Complete Poetical Works" of Keats, edited by H. Buxton Forman (noticed in our issue of January 10), has been reissued in cheaper form by the Oxford University Press (Henry Frowde). The type is the same as in the more expensive edition, but there are fewer leads between the lines, and the page is smaller.

"The Poems of Thomas Lovell Beddoes," edited by Ramsay Colles, in The Muses' Library of E. P. Dutton & Co., are practically complete, for this single and handy volume contains all his published poems, with the exception of ten, which may be found in the standard two-volume edition of Edmund Gosse. It is not conceivable that Beddoes will ever be popular, yet there will always be a few who will savor the peculiar mingling of the gruesome and the beautiful that runs through his dramas, and who will not be deterred by his incoherence. His most famous play, "Death's Jest Book," is best described as a mixture of Webster and John Ford, mitigated by "Festus" Bailey.

"The Great American Plateau," by T. Mitchell Prudden (G. P. Putnam's Sons), is purposely a simple story. He does not go deeply into matters geological, zoölogical, or ethnological. His portrayal of this desert land is essentially impressionistic—a glimpse of its formation, its scenery, its present and its past inhabitants, and the life of the stranger who, leaving behind civilization, dares enter its wastes. The author's style is most attractive; and pervading the book from cover to cover is the spirit of the ideal traveller, who, like the poet, is born, not made; and into his making must go the ingredients of enthusiasm, indomitable good temper, and indifference to all discomforts. We are delighted with the author's humorous description of crossing the Colorado, and greatly interested in his account of the present-day Indians and of the cliff-dwellers of the past. The book on the whole has the charm of freshness and reality, and it cannot fail to fulfil the author's hope "that some other town dweller may be led to wander away from the beaten tracks into the serene and inspiring solitudes of this land of wide horizons."

The *American Journal of Philology* is not designed to amuse an idle hour, but occasionally Professor Gildersleeve gets in a bit of picturesque writing in his paragraphs of "Brief Mention." Thus, in the present issue of the magazine, he has this happy characterization of Isocrates: "For my own part, in spite of sundry flippant utterances, I have long valued Isocrates as a touchstone for the appreciation of what may be called the physical charm of the Greek language." The phrase is apt. And it may be added that any one who fails to feel this "physical charm" of Isocrates's balanced periods is partly color-blind to style. Professor Gildersleeve then relates his experiences as a young student in Berlin, when he inscribed himself for Bekker's lectures on Isocrates. What was his surprise to find the smallest auditorium of the university assigned to the course. "At the appointed hour the great man came in scowling, plunged his face into his notes, and began to read with scant comment a lot of *variæ lectiones*. I was quite unprepared for that sort of lecture, and after a few times fell out, as I believe the rest did also, to the joy of the old scholar, who was thus liberated from his task."

An addition to the bibliography of periodical literature has been compiled by Prof. H. O. Severance of the University of Missouri under the title, "A Guide to Periodicals and Serials of the United States and Canada." It is arranged in alphabetical order, with the name and place of publisher and price of subscription. The material is also given in classified order, so that any one wishing to make up a list of serials on a particular subject has the material at hand. The list aims to be complete for all periodicals of importance. The purpose is to make the Guide an annual.

The parts of Prof. Morris Jastrow's "Die Religion Babyloniens und Assyriens" (Giessen: A. Töpelman) continue to appear at the rate of about one in nine months. The tenth part, now before us, consists of the major portion of chapters nineteen and twenty. There are five or six more chapters to follow, besides a portfolio of illustrations. Three years ago it was announced that the work would probably be complete in eleven parts. Now it is expected to contain about fifteen parts. Beginning as a translation of Jastrow's "Religion of Babylonia and Assyria," in the series of Hand-books on the History of Religions, it has developed into an altogether new work. Almost nothing of the corresponding chapters of the English original is retained in the two chapters which now lie before us, Professor Jastrow having entirely rewritten these chapters, which deal with oracles, omens, and the like, as the result of new discoveries of material and of his own further studies. The fact that there is a demand for the translation into German of this and other similar works is an indication of the changing conditions of scholarship in this country. Thirty years ago American students in such fields depended almost entirely upon German works, and foreign scholars never thought of consulting, much less of translating, American books.

A language atlas (*Sprachatlas*) of the Russian empire is being prepared by a special commission of the Imperial Academy of Sciences in St. Petersburg, under the direction of the academician, F. C. Korsch. The coöperation of scholars and learned bodies throughout the empire has been secured. Valuable material has also been obtained by the journeys of various investigators, especially by N. N. Durnovo of the Moscow University.

The annual report of the Pennsylvania Home Teaching Society and Circulating Library for the Blind for 1906 shows an increase of 37 per cent. in the number of blind books circulated. One hundred and fifty-nine new readers were registered, making a total of 1,121. The circulation reached 9,289 volumes, of which 2,220 were distributed directly by the teachers of the society and 4,980 were sent by mail to all parts of the United States and Territories. Three teachers are regularly employed to teach the reading of embossed type.

The Mikado has given permission to found a Catholic university in Tokio, to be manned and managed by the Jesuit Fathers. According to *Le Catholique Irlandais*, the professors have already been selected, and are nearly all either English, Irish, or American. The Mikado has also given the Jesuit Fathers permission to erect a new church in the Japanese capital city.

The improvement of rural education in England is advocated in a recent report of the Education Committee of the County Councils Association. The report suggests that the study of geography should begin with the physical features of the district, and of history with the events associated with some local battlefield, ancient church, or castle. Arithmetic should introduce as much out-of-door measurement of land, crops, etc., as possible, and the pupils should also ascertain, by weighing and measuring the weight of wheat, barley, and oats per bushel, etc. The problems of the class room should bear on rural life and work, as household accounts, the value of local products, interest on savings bank deposits, cost of cultivation, and the number of cabbage plants required per acre. Manual work should include the cultivation of a vegetable plot, the making of useful things such as hencoops and garden frames, and the boys should also learn to mend a gate by a model. The report has obvious bearings on our own problems of rural education.

Students who go abroad to use the Bibliothèque Nationale at Paris will be glad to hear that the new administrator, Henry Marcel, has quickened the delivery of books by the introduction of *transporteurs automatiques*.

The death is announced of the Danish churchman and historian, Frederik Nielsen, whose "History of the Papacy in the Nineteenth Century," in its English version, was recently reviewed in the *Nation*. Bishop Nielsen was born in Aalborg, in 1846, and after studying in Germany took up his work as preacher in Copenhagen in 1873, and at the same time as *Privatdozent* in the university. In both professions he rose by gradual steps to the highest eminence. He kept closely in touch with religious movements in England. Among his many historical and theological works, besides his "History of the Papacy," are studies of "Freemasonry and Christianity," "John Wesley and the English Established Church," "Charles Kingsley and Christian Socialism in England," and "Edward Irving."

EDWIN L. GODKIN.

Life and Letters of Edwin Lawrence Godkin. Edited by Rollo Ogden. 2 vols., pp. 322, 278. New York: The Macmillan Co. $4.00 net.

The influence of Edwin L. Godkin upon American life and thought is something that must be pronounced unique not only in the history of journalism in America, but in that of journalism anywhere. The very fact that no definite and concrete embodiment of its results can be pointed to as in any adequate sense the measure of that influence, only emphasizes its uniqueness. Not that such concrete embodiments are wanting. The cause of civil service reform owes to Mr. Godkin, above all other men, the impetus that was essential to its obtaining a foothold and the support that was necessary to its advancement in the pioneer days; in that liberalizing of poli-

tical thought which led to the closing of the disgraceful chapter of carpet-bag rule in the South, he was a powerful factor; in the cause of sane and honest finance he was a most formidable and effective fighter; in the development of the spirit of independence as against servile attachmeut to party, it would be difficult to measure the magnitude of his service; in the single fact of the defeat of Blaine and the election of Cleveland, which not only his splendid work in the campaign, but his teaching for a score of years before, did so much to bring about, might be found a not unworthy monument of his labors. But no one who grew up under the influence of the *Nation* in its first two decades, or who, though of maturer years, continuously felt its power in those times, would regard any or all of these achievements as more than a mere symptom of the kind of thing that Mr. Godkin accomplished for him and for the country. There have been journalists and orators who, identified with some great cause, have achieved results that stand out more definitely and boldly than anything that can be ascribed to Mr. Godkin. Cobden or Bright in the establishment of free trade, Garrison or Greeley in the abolition of slavery, occur at once to the mind. But where are we to find an example of a man to whose name the label of no one cause, the leadership of no one party or sect, the advocacy of no one dogma, is attached, and yet whose influence as a journalist was, for a quarter of a century, the most potent moral and intellectual force in the life of a great nation?

There are, to be sure, those who will doubt the justice of this estimate. The *Nation* never counted its readers by the hundred thousand. Its subscribers and readers were scattered over the great continental area of our country, and would have cut but a small figure in the census of her thirty or fifty million inhabitants. But there was scarce a community which did not count its one or two or a dozen faithful disciples of the *Nation;* men and women—aye, and youths and maidens—to whom the regular coming of that visitor was the great intellectual and spiritual event of the week. And alongside of this profound and penetrating influence on thousands of earnest natures, young and old, and together with the comfort and sustenance the *Nation* was giving to men of cultivation and of learning throughout the land, must be reckoned the influence it exercised, at one remove, upon the whole people, through the columns of the newspapers of the country. Editors might not say much about the *Nation*, but they read it; and they were, both consciously and unconsciously, deeply affected by it. To appreciate fully the vast and continuing effect of the currents thus set in motion both among individuals and in the press requires, perhaps, a vivid imagination; but it can only be a defective imagination that fails to recognize that the effect has been very great.

That the *Nation*, and this extraordinary influence which emanated from it, was the product of one man's personality and power is certain, in spite of the fact that Mr. Godkin enlisted in its service a large part of all that was best in the world of American letters and scholarship. Never was there a more striking illustration of the remarkable phenomenon, upon which Bagehot has commented so instructively, of the contagion of quality which makes all the writing in a journal of marked character seem the work of a single hand; whatever excellence each of the writers for the *Nation* may have possessed in his own right, there was superadded to it the special quality which took possession of them when they were contributing to Mr. Godkin's paper. Professor Norton, in one of the letters quoted in Mr. Ogden's volumes, after saying that his own share in making the *Nation* possible was his "best claim to the gratitude of posterity" adds: "And, after all, *You* are the *Nation*"; and in saying this he but expressed what everybody felt who knew the *Nation* in its early years.

What were the personal qualities, what the intellectual and literary gifts, that made such an achievement possible? A great store of delightful material, of varied and fascinating interest, bearing on these points, is to be found in these volumes; but in some sense the question requires no answer. Mr. Godkin's qualities were manifest in his work. It was a man, not a writer, we were listening to; it was a man, not a journalist, who stirred our pulses and provoked delicious laughter, or aroused indignant scorn, or threw flashes of penetrating light upon any question of politics or morals or manners that he discussed. The explanation of his unique power was that he possessed a unique combination of qualities; but this combination of qualities requires no research to discover. A keen speculative thinker, his analytic powers never dominated him; they were more than matched by the moral fervor and the human intensity of his nature. Earnest and intent as he was in the preaching of his gospel, his trenchant wit and abounding humor made his sermons the very antipodes ot sermonizing. With a command of biting satire that has rarely been equalled, this quality, which so easily tempts either to flippancy or to cynicism, never led him astray. With a great knowledge both of books and of the world, he was as far as possible removed from pedantry; heaviness and he were many miles asunder. These are qualities that canuot be assnmed; no man, by taking thought, can add so much as an inch of them to his stature. They are of the very fibre of the man; one feels an absolute assurance that to know his life is but to know him more fully as the man we have already known by the work that has delighted us and that has won our admiratiou and gratitude.

The volumes Mr. Ogden has made, chiefly out of Mr. Godkin's personal correspondence, his letters to the London *Daily News* and his recorded reminiscences, amply confirm this assurance. We are introduced to no new figure, we get no "sidelights," no revelations—and we do not miss them in the least. It is no new acquaintance that we are forming, but a better and closer acquaintance with the man who made the *Nation* and edited the *Evening Post*. His work in the latter position will make by itself a notable chapter, when a philosophic history of American journalism comes to be written. The shrewd and genial man of the world, the penetrating and discriminating observer, the keen dissecter of character, personal and national, the hater of sham and despiser of pretentious mediocrity, the lover of life and humor and reality—this is the figure that is disclosed to us in a hundred interesting aspects of human intercourse and of literary activity. Those, however, who look for much in the way of "psychological development" will be sadly disappointed; fortunately, there is still a very respectable minority who can get on quite comfortably without it. The fact is that the Godkin who is presented to us as the youthful Crimean War correspondent of the *Daily News*—one may almost say the Godkin of whom we get a few striking glimpses in his school and college days—is essentially the same as the Godkin whom we have known, in this country, at the height of his powers. With full justification does Mr. Ogden apply to him what was said of another: "Though he writ as young as Cowley, he had no puerilities; and his earliest productions . . . may make gray authors blush."

Mr. Godkin was born in Ireland in 1831, and was deeply moved, in his early youth, by the agitation for Home Rule. The great revolutionary upheaval on the Continent came at the most impressionable period of his life. He wrote a "History of Hungary" in 1852, and the work, whatever may be its defects, presents, as Mr. Ogden says, "abundant premonitions, both in thought and style, of the man that was to come. Indignation at injustice, hatred of oppression, love of liberty, belief in self-government, blazed in the youth as they burned in the man." Less reminiscent of his later work, but only because the subject-matter is so different, were the *Daily News* letters from the seat of war. Here we have vivid descriptions of men and events, acute comments on military situations, picturesque and humorous accounts of strange peculiarities of manners and customs; nor are there wanting perilous adventures, by flood and field, on the part of the young correspondent himself. One cannot help feeling, in reading these specimens, that a collection of all of Mr. Godkin's Crimean letters would make a most readable volume, despite the passage of time. An interval of only a year separates his Crimean War correspondence from his arrival in the country of which he was to become so illustrious a citizen. He landed at New York in November, 1856; and, though he intended from the beginning to make our country his permanent home, his first work here was the writing of a series of letters to the *Daily News*, largely from the South, of which we get a number of extremely interesting examples in these volumes. It is a marked feature of them—over and above that same graphic quality which characterized the letters from the East—that the crudities of American civilization and the absurdities and vices of American political life were laid bare with something of the same incisive art that was afterwards to do such savage execution in the *Nation;* while at the same time deep-seated sympathy with America and confident hope for her future are plainly manifest. How genuine was this sympathy was soon effectively demonstrated. In discussing the Trent affair, Mr. Godkin sent broadside after broadside into the British position, though the editorial columns of the *Daily News* were on the

other side; and this was but a premonition of the splendid service which his letters throughout the Civil War did to the upholding of the Union cause in England. Writing to Mr. Godkin in 1865, George P. Marsh, our minister to Italy, said: "I am fully aware of the vast services you have rendered our national cause by your very able letters in the *Daily News*." As in the case of the Crimean letters, the reader's only regret, here again, is that he has not the opportunity of reading them all. Almost immediately upon the close of the Civil War came the establishment of the *Nation;* and henceforward, with the exception of one or two striking letters to the *Daily News*, on general subjects, and of some of Mr. Godkin's written recollections, the collected matter in these volumes consists chiefly of personal correspondence.

Both in the selection and in the arrangement of all this material, Mr. Ogden has performed his task with admirable taste and skill. One cannot, to be sure, say how much more might to advantage have been included; but there is no difficulty in pronouncing that not a line that is given should have been omitted. There is hardly a page that is not full of interest, and much of it is of fascinating interest. We have Mr. Godkin in his relations with Norton, and Olmsted, and Lowell, and W. P. Garrison, and, in lesser measure, with a score of other men of light and leading; in his correspondence with several charming women whose affection and admiration formed one of the bright features of his life; we get, but with great reserve, some glimpses of the sadness with which his life was more than once visited by the hand of death. Both his first marriage, in 1859, and his second marriage, in 1884, were unions of rare and complete happiness; but his domestic life is touched upon only in the briefest possible way. The letters are so arranged, neither altogether chronologically nor altogether by subject-matter, as to avoid both that jerkiness which is apt to be produced by the one arrangement and that feeling of mechanicalness which is apt to result from the other. The connecting portions of the work, in the shape of narrative and comment, supplied by Mr. Ogden, are confined to modest proportions, but are both interesting and illuminating. Altogether, the book is one which all who have loved Mr. Godkin will prize, and which all to whom he is only a name will read with equal pleasure and profit.

It is the fate of those who serve their generation as Godkin did to get little of the reward—such as it is—of either contemporary or posthumous fame; the work of a journalist, however splendid, cannot possibly be, in its embodied form, a "possession for all time." Its spirit, when it is of the lofty quality of Mr. Godkin's work, survives through a thousand agencies that it has set going; but the work itself is not preserved, and the memory of its author is apt soon to become little more than the shadow of a name. It is, therefore, no small service to the present generation to set before it, "in his habit as he lived," with his warm and loyal friendships, his playfulness and his affection, his bitterness and his humor, his joys and his sorrows, such a "man and leader of men" as Edwin L. Godkin.

CURRENT FICTION.

Partners of Providence. By Charles D. S. Stewart. New York: The Century Co.

In the five hundred and odd pages of this rambling account of river life on the Missouri and the Mississippi there is not a false note, a sentence out of key, or—rare quality in books of popular humor—one second of doubtful taste. Like Huckleberry Finn, Sam Daly is drifting down stream, hunting for a mislaid comrade. Where Mark Twain dropped the chronicle of Western steamboat life, Mr. Stewart has taken it up, fixing for a moment the changing customs of the period which came after central grinding mills appeared in the cane country, and before New Orleans covered her gutters.

No student of child life has been happier in catching the ardor, the inconsequence, of the average small boy, with his queer pockets of mental confusion and his equally disconcerting minutes of illumination. Mr. Stewart tells his story at great length, with every possible divagation and detail, but it is a genuine wealth of detail of which no one would willingly spare a word. It is hard to say exactly in what the charm of his humor consists, except that he has the apt and natural comic word and point of attack, as some comedians have the indescribable mirth-provoking gesture. He understands his little boy as few have done since Mr. Howells in "A Boy's Town"—the wary, inquiring, part-savage creature, taking half the universe for granted and thinking himself into a fever over matters of small consequence. "Partners of Providence," however, is entirely free from the pseudo-scientific taint; there is no conscious or unconscious effort to identify Sam with the childhood of the race, or otherwise turn his extremely human and personal little figure into an edifying generalization.

The whole bears the mark of first-hand observation, made with a delightful and unhurried humor. Books about the Mississippi call for leisure, for time to dally with irrelevant incident, to wind forward and back like the bends of the river itself. The episode of the roustabouts' chicken dinner may not be "structural," but without it the reader would be many laughs the poorer. The part played by Aunt Jemima's flatiron is as racy as anything told by Tom Sawyer. Any isolated bit does scant justice to Mr. Stewart's fun. It is too much made up of a whole point of view and a happy aptness of phrase, a sympathetic understanding of small things, to lend itself to quotations; and its greatest achievement is to travel over so well worn a road and yet produce something as unhackneyed as if the Mississippi Basin were a fresh ground for fiction.

The New Chronicles of Rebecca. By Kate Douglas Wiggin. Boston: Houghton, Mifflin & Co.

Of "The New Chronicles of Rebecca" it need only be said that it is absolutely certain to enthrall those people to whom such bits as the following appear in the light of humor:

> Written language is for poems and graduations and occasions like this—like a kind of Sunday-go-to-meeting dress that you wouldn't go blueberrying in.
>
> Thirza, you mustn't chew gum at a missionary meeting; it isn't polite nor holy.

Rebecca saves a baby from the poorhouse. She organizes the little girls of her village as home missionaries, only to be routed at their first attempt upon the village cynic. She writes many poems (all of which are quoted) in the style of rustic obituaries, and keeps a diary (also quoted at length) which suggests a question. Would the readers who enjoy this artless product be pleased, or over-stimulated, if chance introduced them to Marjorie Fleming, and gave an opportunity for comparison between its genuine oddities and the somewhat labored quaintness of Rebecca? The present volume conducts Rebecca to her eighteenth year, and closes, or, rather, is left sufficiently ajar, to permit a vista of indefinitely prolonged future chronicles.

The Miracle Worker. By Gerald Maxwell. Boston: John W. Luce & Co.

Mr. Maxwell makes his hero an Afghan prince, and does well, since only upon an Oriental could sit gracefully such powers in occultism. He makes him a Leipzig doctor of medicine, and thus gives plausibility to almost unearthly scientific attainment. He makes him a vivisectionist, and thus facile in the beneficences of cruelty. Finally he makes him a winning youth with the doctor's passion for rescue, and thus an easy candidate for feminine favor. He is a combination of Dr. Isaacs and Daniel Deronda with Svengali. He embarks upon the impossible, and failing, has recourse to the yet more impossible. To have him return to his princely surroundings in Afghanistan at the last with his red-haired German-nurse wife, is logical; he is too eerie a being for Europe. The author, however, does not tell his tale eerily in the least. All is as calm and practical as an inventory; the nocturnal journeys, the anæsthetics, the antiseptics. Hypnotism rages, but soap and hot water are not forgotten.

However mild its manner, it is a wild story of endeavor to save the life and looks of a woman who has been frightfully burned at a Christmas tree; of a parallel attempt to save from execution a poor weak woman criminal; of a startling likeness between the two, and so on and on to gruesome concludings. It is ingenious and up to a certain point interesting, but credulity and sensibility finally rebel. The exit to the Orient is rather finely dramatic, and the Jesuitical turn by which the doctor's immunity from discovery is made to hinge on the success of missionary work in the slopes of the Hindu Kush is almost satanically clever.

Phantom Wires. By Arthur Stringer. Boston: Little, Brown & Co.

Those who enjoy melodrama will have a treat in Mr. Stringer's latest book. The plot is constructed with skill and worked out with more than ordinary ability. The struggles between Durkin and MacNutt are strongly reminiscent of those between Sherlock Holmes and Professor Moriarty. But there is this difference: Conan Doyle gave us the strugle of the criminal with the representative of society; Mr. Stringer depicts the conflict between two criminals.

Indeed, Mr. Stringer seems to have a penchant for the apotheosis of the criminal; he paints the underworld *couleur de rose.* He has rare descriptive powers, and can create

an atmosphere or a background with artistic skill. One can but regret that he does not choose worthier themes for the exercise of his unusual talent.

The Giant's Strength. By Basil King. New York. Harper & Bros.

The casual reader of "The Giant's Strength" will be tempted in the course of the third chapter to turn to the title-page to convince himself that he has not inadvertently picked up a copy of the *Congressional Record* and opened it at a debate on railway rebates. We have most of us become reconciled to having our magazines turned over to the "muck-raker"; but some of us still have a feeling of resentment when that indefatigable individual claims the novel for his own. Surely the reader in search of innocent amusement has some rights.

But the fiction lover who forces his way through that third chapter will be repaid by a story of considerable dramatic power. The theme is the love of a daughter of a Trust magnate for the son of a victim of her father's wicked rebates. Her love is returned, and her lover's strength of character is at least equal to that of her father. The conflict between the wills of these two strong men culminates in the eighteenth chapter in a scene of unusual dramatic effect. The tale, unlike most of its class, ends happily.

Neither the father nor the lover is convincingly drawn, but the slow development of the daughter Paula's character under the stress of trial and trouble is admirable.

Midsummer Madness. Translated from the Spanish of Emilia Pardo Bazan by Amparo Loring. Boston: L. C. Clark Publishing Co.

Señora Pardo Bazan is one of the most accomplished and versatile writers in the world, equally brilliant as critic and as novelist, and a principal champion of realism in Spain. The present novel (rendered in admirably vigorous and idiomatic English) is a delightful realistic *jeu d'esprit.* Its buoyancy, its daring, its latinity lift one along in a pleasant flow of somewhat apprehensive spirits to a surprisingly innocent event. The two very human and amiable, if indiscreet, young persons in question are presented with a realism which it would be idle to dismiss as photographic or commonplace. One's heart warms to these grown-up scapegraces who feelingly remind us what we are; or what in certain moods we may be. Indeed, the little tale is conceived in a spirit of tender gayety which marks it for that rare thing, a work of true humor.

Under the Harrow. By Ellis Meredith. Boston: Little, Brown & Co.

One can but admire audacity, no matter how far short of the goal its ambitious arrows fall; but one admires audacity the more when it is tempered with discretion. The older generation of readers, who remember Murger's "Scènes de la Vie de Bohème" and Du Maurier's "Trilby," will find Mr. Meredith's little story of Bohemian life in New York insipid and futile; but it will not be without interest and encouragement for the younger generation. There is nothing in Mr. Meredith's Bohemia to bring a blush to the cheek of a young person; none of its doors need be bolted to keep out Mr. Comstock; all the dwellers there are unquestionable geniuses. Of course, the captious may question the realism of such a description of Bohemia; but this is a matter of little moment, as no one is likely to take the book seriously. The female characters may be said to be drawn, however badly; but the male characters are at most only vaguely suggested.

The book is full of encouragement for writers and artists who have not yet arrived; but is it necessarily ill-natured to question whether such encouragement is needed? Murger told us long ago that the only claim the majority of the dwellers in Bohemia have to the title of Bohemians is their undoubted possession of Bohemian vices. If that is still true to-day, they need rather than encouragement an earnest exhortation to depart from Bohemia.

NEWS FOR BIBLIOPHILES.

A Bibliography of Oliver Wendell Holmes. By George B. Ives. Boston: Houghton, Mifflin & Co.

Another of the series of Bibliographies of American Authors which Houghton, Mifflin & Company have under way now appears in the "Bibliography of Oliver Wendell Holmes," compiled by George B. Ives of the staff of the Riverside Press. Holmes was such a fruitful author, his muse lending itself so easily to commemorate the birthday of a famous contemporary, or the centennial of some important event, that tracing all the offspring of his pen would have seemed next to impossible. Mr. Ives's work, however, has been done well. G. W. Cooke's "Bibliography of Lowell" was better than that of Hawthorne, and this of Holmes seems to be, in completeness and method, a distinct advance upon Mr. Cooke's effort. The Hawthorne, Lowell, and James have been printed on but one side of the leaf; the Holmes, however, is more extensive, filling 322 pages, which, if printed like the others, would have made the volume too bulky. A few blank leaves are bound in at the end for additions or emendations. An important innovation, for a bibliography, is the introduction of several entire poems which have not previously been collected, thus giving the compilation a literary flavor, and making it, perhaps, more interesting to the general reader. But the bibliography, while extensive and remarkably full, does not recognize adequately the wants of the collector of first editions of Holmes. The matter is here, but scattered, and in part hidden by the record of later editions. This record, though of small interest to the collector, increases the value of the book to the student.

After the short title list of Dr. Holmes's published books comes an alphabetical list of single titles, filling, with examples, extracts, and comments, 115 pages. Then follows the chronological list of single publications, whether leaflets or books, which, with the exception of the first and the two last entries, are entirely by Holmes. The first entry is "The Harbinger," generally regarded as Holmes's first volume of poems, though one-third only was by him; Park Benjamin supplied Part I., and John O. Sargent Part III. The last two entries are medical works edited by Holmes, which are put in this section because there is no other suitable place. Then, after the Collected Works, filling two pages, come the lists of selections and compilations, books containing letters by Holmes, Holmes's contributions to the *Atlantic Monthly*, and biographies and criticisms. Following these are the records of sales at auction, an important appendix of items about which information was secured too late for insertion in its proper place, and a (not very useful) index.

Holmes's earliest printed verses seem to have been in the *Collegian*, of February, 1830. To identify positively his first appearance in a book is impossible. "The Gleaner, or Selections in Prose and Poetry from the Periodical Press," published at the office of the *New England Galaxy*, 1830, contained five of his poems, one of which had appeared in the *Collegian* and the others in the *Amateur*. In Morse's Life of Holmes is a letter by Holmes, then a junior at Harvard, March 28, 1828, in which he says:

> I smoke most devoutly, and sing most unmusically, have written poetry for annual, and seen by literary bantlings swathed in green silk and reposing in the drawing-room.

This "annual" may have been "The Token" for 1828, which was bound in silk; but all the contributions were anonymous and no poem therein was ever claimed by Holmes. In the absence of positive evidence, "The Gleaner" may be set down as the first book to which Holmes contributed.

Additions to Mr. Ives's lists are certain to come from time to time. Other volumes containing letters are likely to turn up; and Holmes's fondness for printing poems in leaflet or broadside makes it probable that a few of these fugacious scraps may be discovered. A copy may yet be found of the broadside. "Old Ironsides," which was circulated in Washington in 1830, and which seems to have disappeared entirely.

Mr. Ives has not made wholly clear the various issues of Holmes's "Oration delivered before the city authorities of Boston on the Fourth of July, 1863." There were two distinct printings in large type, quarto. The first, twelve copies only (besides an unknown number "which the printers were allowed to preserve as typographical specimens"), was undoubtedly printed before the oration was delivered, and, as Holmes says in an introductory note, "for the sole purpose of rendering easier its public delivery." The types were evidently kept standing, and, after delivery, a few changes were made and some additional copies struck off. Both of these varieties have the imprint of John E. Farwell & Co. There were also at least two issues in small type, octavo. Besides those with the Ticknor & Fields imprint, as described by Mr. Ives, some copies, in cloth, as well as in paper, have the name of John E. Farwell & Co. on the title. Of course, the manuscript of "The Chambered Nautilus" offered at the Whipple sale was not "the original manuscript," as stated by Mr. Ives, but a copy written off by Dr. Holmes as a Christmas remembrance for Mrs. Whipple. The inscription reads, "For Mrs. Whipple," instead of "For Mr. Whipple."

Hugh A. Morrison has compiled what he calls "A Preliminary Check List of American Almanacs, 1639-1800," which is print-

ed by the Library of Congress. It is impossible to exaggerate the importance of this feature of early American imprints, for the Almanac occupied a unique position in the colonial household, and its thin trickle of literary expression watered many an unpromising field. An Evans or a Franklin had followers, and some of the products are of permanent value. Pennsylvania was the largest manufacturer of almanacs (fifty pages of the list), with Massachusetts second (thirty-four pages), and New York third (twenty-one pages). As a preliminary list this issue shows great care and accuracy on the part of the compiler.

On April 22 to 25, the Merwin-Clayton Sales Company offers Part 4 of the library of Dr. Kopetschny of Jersey City. This portion includes bibliography, biography, music, natural history (some fine and rare works with colored plates), poetry, and drama.

On April 24 and 25, Stan. V. Henkels at Davis & Harvey's in Philadelphia, will sell Part 4 of ex-Gov. Pennypacker's library. This is his collection on general American history. The first hundred lots comprise American genealogies. Books on the Revolution make up an important section, the list of Tory tracts printed by Rivington, New York, being one of the most extensive offered in a long time. Of earlier books one of the most valuable is David Pietersz de Vries's "Korte Historiæl ende Journæls æntepekeninge Van verscheyden Voyagens," 1655, which contains an interesting description of New Netherlands. Other important books are: Edwards's "Materials towards a History of the American Baptists, 1770-1792," vols. i. and ii., all published and very scarce; Loudon's "Narratives of Outrages committed by the Indians," 1808, extremely rare; Livingston's "Review of the Military Operations in North America," New York, 1760; George Keith's "Presbyterian and Independent Visible Churches in New England," 1691; Ward's "Simple Cobler of Aggawam," 1647; and Rogers's "Coneise Account of North America," 1765. There are several valuable narratives of early Western travels, among them: Zadok Cramer's "Navigator," Pittshurgh, 1811; Cuming's "Tour to the Western County," Pittsburgh, 1810; Fisher's "Account of the Travels of Lewis and Clark," Baltimore, 1812; Gass's "Journal," Pittsburgh, 1807; Michaux's Travels to the Westward of the Alleghany Mountains," 1805; Pattie's "Personal Narrative," Cincinnati, 1833; and Pike's "Expeditions to the Sources of the Mississippi," 1810. Part of a manuscript orderly-book, kept by Gen. Henry Dearborn at Valley Forge, January 13 to February 4, 1778, is also interesting.

Collectors of books and prints relating to the French Revolution and the Napoleonic period will enjoy an unusual opportunity at the dispersal, April 24 and 25, by Libbie & Co., Boston, of the library of A. D. S. Bell of Cambridge. With few exceptions the books are in English. Many unusual early American publications are included. Among illustrated works are the "Description de l'Égypte," 1822-29, 37 vols.; Ireland's "Life of Bonaparte," 4 vols., with 27 folding colored plates by George Cruikshank; Combe's Hudibrastic "Life of Napoleon," 1815, with 30 colored plates by George Cruikshank; Mudford's "Campaign of Waterloo," and Nicholson's "Wars of the Revolution." The collection of Napoleonic caricatures by Gillray, Rowlandson, Cruikshank, and other artists is extensive.

At an auction of books of George Gray, held by Sotheby, Wilkinson & Hodge, London, March 20 and 21, the following prices were paid: Z. Boyd's "Last Battel of the Soul in Death," Edinburgh, 1629, £55; autograph letter of Burns to John Ballantyne, January 14, 1787, £141; the Kilmarnock Burns, 1786, short copy, £260; 101 uncut leaves of the same edition, £120; Shakespeare's Fourth Folio, 1685, Knight & Saunders imprint, £772; Shelley's "Prometheus Unbound," 1820, £27.

At an auction at Dowell's, Edinburgh, March 26, the first draft of Burns's "Thou Liberty, Thou Art My Theme," brought £33; a copy of the first Edinburgh edition of Burns's "Poems, Chiefly in the Scottish Dialect," with a few blanks filled up by the poet, £60.

History of the Italian Republics in the Middle Ages. By J. C. K. Sismondi. Entirely recast and supplemented in the light of subsequent historical research, with a memoir of the author, by William Boulting. New York: E. P. Dutton & Co. $2.

Exclusive of introduction, chronological tables, and index, this volume contains 799 pages, with an average of over 600 words to the page; and its excellence is well-nigh as phenomenal as its cheapness. There is no other book in the English language which covers anything like the same ground; and Mr. Boulting's assertion that he has entirely recast and supplemented the work of Sismondi in the light of subsequent historical research, is no idle boast. The volume in all its larger aspects is entirely up to date, as witness the ruthless destruction of the silly old fable that feudalism never took root in Italy. On the contrary, as our author justly remarks (p. 25), "Italy is the country where feudalism in its essence most flourished and longest survived"; and we welcome this statement all the more warmly that some of the most authoritative among our English contemporaries still adhere to the ancient heresy (*e. g.*, The London *Athenæum* of December 31, 1904, page 900). On the other hand, as was almost inevitable in attempting to cover so wide a field, Mr. Boulting has occasionally fallen into errors of detail; and, since his book is likely to go through several editions, we venture, in the hope that this admirable work may ultimately be rendered perfect, to point out certain slips in regard to the history of Central Italy, and in particular that of Tuscany and Umbria. Other critics may help in other fields.

Mr. Boulting has divided his volume into eight books, representing various periods of Italian history; each book being again divided into numerous sections and subsections, a fair proportion of which deal separately with separate republics—Rome, Milan, Venice, Pisa, Genoa, Florence, Siena. This method, although it entails a certain amount of repetition, has undoubted advantages. We are, however, by no means convinced that all these cities deserve to have their histories recorded in detail to the end of the chapter. Take, for example, Pisa and Siena. What have they to teach us, after the end of the thirteenth century, concerning any of the larger issues of Italian history? It is perfectly true that they had their period of vigorous life, and that each of them held the hegemony of Tuscany in her turn; but it is also true that, after the battle of Colle di Val d'Elsa in the case of Siena, and of Meloria in that of Pisa, the history of Florence is the history of Tuscany, and comprehends that of the neighboring communes. By the history of Florence we, of course, mean her political history. Artistically, the history of Siena continues to be of primary importance for another two hundred years; while her chronicles, though they deal mainly with intramural discords, remain a joy for ever, vivid and picturesque as any in Italy. Nevertheless, from the last quarter of the thirteenth century she was only a pawn in the great game of Italian politics, and a pawn which was generally pushed about the board by Florence. In fine, the substance of our contention is that both she and Pisa should have been treated with greater fulness while they were greater than Florence, and then no longer dealt with separately.

With regard to Pisa, Mr. Boulting tells us (p. 93) that "there are so many gaps in her history that it is difficult to trace the development of her municipal self-government." We will not dispute his statement, but we believe that he might see his way to filling some of those gaps if he would consult Professor Volpe's learned works, and especially his "Studi sulle istituzioni Comunali a Pisa (Città e contado, Consuli e Potestà) sec. xii.-xiii." In the case of Siena no such difficulty exists, and thanks to the indefatigable labors of Professor L. Zdekauer, we have ample materials for the reconstruction both of her *vita privata* and *vita pubblica* in the days of her greatest triumphs. Yet the sections which Mr. Boulting devotes to Siena of the thirteenth century are both colorless and inaccurate. He attributes the foundation of the Sienese Cathedral to the year 1249, though Professor Langton Douglas, in his "History of Siena," avouches excellent reasons for accepting the statement of Malavolti that the work was actually begun in 1245. Then he follows Villani in providing Siena with a gate she never possessed (p. 277); he sets Asciano on the Roman road, and asserts (p. 281) that it was taken by the Florentines between 1267 and 1282—apparently in 1274—whereas it really fell to their arms in 1234 (Tommasi, "Historia," ad annum); while, finally, he tells us that Siena was Ghibelline in 1307 (p. 290)—mistakes, all of them, which he could hardly have made had he studied the history of Siena from Sienese documents and Sienese chronicles.

These, however, are matters of comparatively little moment, and it is not until we turn our attention to the Umbrian communes that we are aware of what we can only regard as a serious lacuna in any work which purports to be a History of the Italian Republics; for Mr. Boulting scarcely deems those communes worthy of notice. It is true that, on page 66, we are informed that Orvieto was "specially early in development"—a dictum which is directly opposed to the opinion of the greatest living authority on Umbrian history (see

L. Fumi, "Codice Diplomatico d'Orvieto," pp. iii.-iv.); but Orvieto was, after all, a town of secondary importance, and we have a far more serious ground of complaint in the matter of Perugia. Since Perugia, during the first half of the fourteenth century, exercised considerable influence in Italian politics, she should, we contend, have been singled out for separate treatment. Mr. Boulting, on the contrary, looks upon her as a negligible quantity, declaring (p. 446) that "owing to the occasional presence of the Papal Court, she had never acquired the same degree of liberty as the other cities of the Papal States." Where he got such information we are unable to imagine, unless, indeed, he has been misled by the inaccurate "Story of Perugia" in Dent's Mediæval Towns Series. Perugia at this period was unquestionably as free as any commune of Central Italy, and, next to Florence, was the most powerful. From the first her relations with the Papacy had been rather those of an ally than of a vassal (Bartoli, "Storia di Perugia"), and, after the removal of the Papal See to Avignon, its rectors were flouted, its cities usurped, and its authority openly set at naught. Yet the alliance continued, because Perugia alone upheld the Guelf cause in Umbria; and but for Perugia the Papal States would probably have been lost forever. It follows, therefore, that if the history of the Papal States is important, that of Perugia is important too. We recommend Mr. Boulting to study such works as Fumi's "Eretici e Ribelli nell' Umbria dal 1320 al 1330," "I Registri del Ducato di Spoleto," by the same author; Antonelli's "Vicende della Dominazione Pontificia nel Patrimonio di S. Pietro in Tuscia," Calisse's "I Prefetti Di Vico," and, last but not least, Filippini's "La Riconquista dello Stato della Chiesa per opera di Egidio Albornoz." They will, we trust, convince him that he has neglected a most important branch of his subject.

In conclusion we would point out that the bibliography is far from satisfactory, and that the too frequent lack of footnotes, giving chapter and verse for the statements made in the text, is much to be regretted. The index also needs enlargement and revision. Yet, with all its faults of omission and commission, the work remains a monument of painstaking compilation, and not even the most modest English library which has a shelf for books on things Italian can do without it.

The Labor Movement in Australia: A Study in Social Democracy. By Victor S. Clark. New York: Henry Holt & Co. $1.50 net.

In 1903 Mr. Clark visited Australia and New Zealand, under commission from the United States Bureau of Labor, and prepared two excellent reports upon social conditions at the Antipodes, which were published in the "Bulletin" of the bureau. In the volume now before us he undertakes a philosophical account of the rise, policy, and results of the political labor movement in Australia. That this movement is frankly socialistic he tells us at the outset, observing, however, that it differs from European socialism as British political history has differed from Continental. Australasian socialism is a vigorous popular demand for concrete reforms which are immediately brought into the domain of practical politics; and it has been little influenced by anyone's theories about surplus value, the class struggle, or the iron law of wages. It is, indeed, almost "a socialism without doctrines," but always strong upon the side of its practical programme.

Mr. Clark shows that the causes of the present labor movement in Australia reach back into the distant past. The paternal government necessary in the early convict settlements is reflected in the paternal policies of the modern democratic communities; the prevalence of the grazing industry gave rise to large estates which prevented the growth of a conservative middle class in the agricultural districts and created a distinct agrarian problem; the stream of immigrants was diverted from the land to the cities, where a very large percentage of the population soon came to consist of hired laborers suffering periodically from unemployment; the construction of highways and other public works by convict labor while transportation continued, established the precedent for government railways and public works to employ idle labor; and then when parliamentary government was introduced, about the middle of the nineteenth century, the large landed interests were virtually placed in control and permitted to set up a class government of an aristocratic type, which was bound to provoke revolt and invite transition to class government of the so-called democratic kind. In 1890, when the present labor movement began to gather strength, it was necessary for the workers to contend simultaneously for equal suffrage, free schools, and rational land laws, as well as for the higher wages, shorter hours, old-age pensions, and other things believed to be necessary or desirable. All things considered, the only reason for surprise is that the agitation did not begin sooner.

Once started, the labor movement found all conditions favorable for rapid growth. Forty-seven per cent. of the population lived in towns, where the proportion of hired laborers was large and the work of organization easiest. Then the laboring classes were of the same stock, and the agitators did not encounter those racial difficulties which so greatly complicate the task of the "organizer" in the United States. The industrial workers of the towns and cities were first "unionized"; the railway employees, seamen, and waterside workers followed suit; and then the miners and shearers, non-urban laborers, but easily organized because congregated in mining camps or thrown together in isolated groups on ranches, were brought into line. Since there was no considerable class of small landed proprietors to serve as a makeweight, opposition could come only from the large landed proprietors, who were not numerous. It needed, therefore, but a wave of popular discontent, such as followed the failure of the maritime strike in 1890, and the industrial depression of 1893, to turn the battle overwhelmingly in favor of the labor party, which has maintained its ascendency ever since.

While the party has never looked far ahead of the practical reforms demanded at any moment, a survey of its policies for the past ten or twelve years shows a steady advance towards the ideals of social democracy. The progressive taxation of land values, the breaking up of large estates, and the retention of the public domain not already alienated, point unmistakably toward the policy of land nationalization. The all-comprehensive factory acts and sweeping employers' liability laws mean increased governmental control of industry, which the demand for a statutory eight-hour day and national minimum wage may yet greatly intensify. The growing popularity of State-trading in all its forms—railways, telegraphs, land-banks, coal mines, insurance, warehouses, and the like—implies a corresponding increase of the functions directly exercised by government; while old-age pensions, which have already been established in three States, further enhance public agencies at the expense of private. And all this is not considered a final programme; gradually, yet as rapidly as feasible, the labor leaders propose to abolish, or so far regulate, private employment that in practice, if not in theory, the goal of the collectivists will be reached.

Mr. Clark has something to say about each important part of the labor programme, but is at his best in the chapter dealing with the economic and social effects of industrial regulation, particularly compulsory arbitration. Beginning early in the nineties and culminating in the Federal act of 1904, which applies to disputes reaching beyond the boundaries of a single State, compulsory arbitration has been in operation for a considerable time, and some of its results can be determined with reasonable certainty. As might have been expected, the outcome has been, at various points, very different from what its advocates predicted; yet the laws have all but abolished strikes, and have in some respects improved the condition of labor. But, upon the other hand, the existence of the industrial courts has unduly encouraged laborers to bring cases before them, thus multiplying litigation and making business conditions uncertain. There are single employers who work under as many as seven awards, and some of them have several cases awaiting decision. Wages have been standardized, with the inevitable result that the better workers receive little or no more than the mediocre, thereby losing incentive to efficiency. The least efficient workers, who cannot earn the minimum legal wage, have been discharged; and have either been employed on public works carried on, with borrowed money, for their benefit, or have crept into attics and basements to establish little shops where they make goods which they peddle directly to retailers at cut prices. The courts have regulated such matters as the speed at which the machines are to be run, and the number of men to be employed on a machine. Under these conditions the sole function remaining to the employer would seem to be to pay the bills, for the control of his establishment has virtually passed from his hands. By restricting employers and raising the wages of mediocre workers the cost of production has been largely increased, so that a higher tariff has been called for in order to protect the industries from foreign competition. Indeed, the cost of living has advanced so that the labor leaders are complaining that the workmen are losing the advantages gained by

"progressive legislation," and are beginning to call for State regulation of prices as a necessary concomitant of regulation of wages. In some cases employers "have entered into collusion with their employees to enforce an industrial agreement . . . for the purpose of justifying a rise of prices," so that monopoly has been built up behind "progressive" laws enacted for the benefit of the workers. And, finally, it appears that while employers, by reason of their financial responsibility, are held to strict compliance with the terms of any award, the laborers are able practically to evade the decrees of the courts at many points when the outcome of litigation is not to their liking.

Who pays for it all is clearly shown by Mr. Clark. Up to the present time only a small percentage of the population is engaged in the industries which have been "regulated,"—in New Zealand 3 per cent., in western Australia 7 per cent.; and the "regulated" industries are not those which are the main sources of national income. Agriculture, grazing, and gold-mining have had to bear the burden, and since they produce for a world-market, they have no way of recouping their losses from industrial regimentation. Yet, compulsory arbitration is, after all, but a single factor—and not a principal one at that—in the economic conditions of Australasia; and it is not possible as yet to secure much tangible evidence concerning its effects, one way or the other. Perhaps, as Mr. Clark suggests, the tendency may be for the awards of the courts to become "mere formal statements of average conditions of employment," which will merely prevent great inequalities from existing in particular establishments, and will not attempt to reverse economic law. This would minimize the harm that compulsory arbitration could do, but would also, we fear, decrease its attractions for social reformers.

In his final chapter, Mr. Clark discusses, with genuine insight, the future of the Australasian labor movement. That political responsibility will breed conservatism, he considers certain; and in the growth of a class of small farmers he finds a force that may ultimately check the development of "progressive" policies. The results thus far achieved may "represent progress," but they are no final solution of the problem; while for the United States the experience of Australasia is interesting, but not conclusive. Mr. Clark has covered a large field, and has done his work well; to our knowledge no other writer—in America at least—has brought back from that economic wonderland so reliable a report of the alleged marvels wrought in the name of "progress." His publisher should have seen to it that the book was provided with a better index.

A Revolutionary Princess: Christina Belgiojoso-Trivulzio, Her Life and Times. By H. Remsen Whitehouse. New York: E. P. Dutton & Co. $3 net.

It is curious that the great statesman who more than any one man helped to create modern Italy is, in a sense, the least characteristic figure of the Risorgimento. And if Cavour, who accomplished so much, is the least characteristic, it might almost be said that the Princess Belgiojoso is the most typical. To catalogue the traits of her character would require much space, but the dominant one was clearly her sense of the dramatic. Give her a background, and her imagination would quickly evolve the pose to catch the eye. Whether decked out in fancy dress for the aristocratic balls of Milan, or in classic costume for Lehmann's morbidly staring portrait, or with Phrygian bonnet and tricolored flag to lend a band of fiddlers with Garibaldi and Mazzini through the streets of apathetic Rome in the last days of the Republic, she was always beautiful, always picturesque, always *outré*, and often high-minded. And what more effective background could she find than the Risorgimento? In her earliest youth it was already arising behind her; her heart and her imagination accepted it; and to the end of her days she postured faithfully before its curling clouds of battle smoke and windy rhetoric. For the cause of Italy she poured out her money and her talents with open hands. She even served in the field, for under the fire of Oudinot's batteries and the unjust sneers of many of her own countrymen she organized the hospitals that took in Garibaldi's and Manara's wounded, during the siege of Rome. And in the end what does it all come to? The frail figure of an extraordinary woman fleeting across the historic stage, a woman who could fascinate Alfred de Musset and Margaret Fuller; who advised Charles Albert and Mazzini; who, courted by Milan and Paris, had no lovers, yet may well be suspected of political assassination; whose political judgments were as the weathercocks in March, but who could master and translate that most terribly abstruse or all philosophical works, the "Scienza Nuova" of Vico.

Rafaello Barbiera published in Milan two books, "La Principessa Belgiojoso," 1902, and "Passioni del Risorgimento," 1903, which deal in excellent literary form with the curious personality of Christina Belgiojoso. He is very much at home in the Italian, if not in the French, literature of the period, and his books deserve the success with which they have met in Italy. Mr. Whitehouse supplements Signor Barbiera on some details of the Princess's life in Paris, and though his book cannot rank very high either as literature or history, it will do well enough to introduce to the subject those who cannot read Italian.

Uganda to Khartoum. Life and Adventure on the Upper Nile. By Albert B. Lloyd. New York: E. P. Dutton & Co. $3 net.

This book is a record of travel, adventure, and work among the natives of a little-known part of Central Africa. Its special interest lies in the fact that many of the author's journeys were made in response to appeals for teachers from the kings and chiefs of the savage tribes of the northern provinces of the Uganda Protectorate. It shows also some of the new methods of missionary work: religious instruction being aided by exhibitions of the magic lantern and the phonograph; the drunken dances of the Acholi being combated by the western game of football. Mr. Lloyd's descriptions of these peoples and their manner of life are much more vivid and trustworthy than those of the casual traveller, and he presents the pure savage at times in an unusually favorable light. The naked Acholi, for instance, are so determined to prevent immorality that "the young women are kept in their houses soon after dark, and the young unmarried men have to live in curiously constructed houses erected on piles many feet above the ground."

When the natives learned that the white teacher was coming to live with them, they all with one accord, chiefs and their followers, women and young girls, set to and built a fine house of poles and mud walls for him. Occasionally a woman, carrying on her head a huge earthenware pot of water, instead of emptying its contents on the dry clay which had been shovelled into a pit for mixing, "would splash it all over the body of some fine young warrior who might be busily engaged in ornamenting himself with colored earth or wood ashes; then there was a chase until the culprit was caught, amid much laughter and good will, only to be allowed to go again with nothing worse than a laughing admonition."

Mr. Lloyd's exciting adventures while hunting to obtain food for the natives occupy a prominent place in the early part of his narrative. They were chiefly with lions and elephants, but in one instance he fell into a death-trap for antelope. The closing chapters are devoted to an account of his journey to Khartoum, which necessitated his passing through the sudd, the floating vegetation which for so many centuries has blocked all navigation on the upper reaches of the Nile. So vast is the mass, that the winding channels through the papyrus grass "added at least 300 miles" to his river journey. Incidentally he confirms the testimony of Lord Cromer and other travellers that nearly all the natives of the Congo State Nile region have taken refuge on the British side of the river from the tyranny of the Belgians. Eighty well-chosen illustrations, especially those of the wild tribes, add much to the interest and value of the book.

Science.

Lectures on the Method of Science. Edited by T. B. Strong, Dean of Christ Church. Oxford: The Clarendon Press; New York: Henry Frowde. $2.50.

These lectures formed part of a course on scientific method delivered at the request of the delegates for the Extension of University Teaching during the summer meeting at Oxford, in August, 1905. They are not, what the title would lead the reader to expect, a series of lectures on scientific method as such, but rather samples of investigative problems in diverse fields—including biology, physiology, anthropology, archæology, history, psycho-physics, and mathematical-astronomy. The first two lectures ("Scientific Method as a Mental Operation," by Prof. T. Case, and "Some Aspects of the Scientific Method," by Prof. F. Gotch), which treat explicitly of the subject designated in the title of the book, are in reality the least valuable chapters.

The real contributions to the study of method are tacit and incidental features of the other papers, which make the least overt reference to the subject. These are not so much discussions, as exemplifications, of method. It remains for the methodologist to dissect out the logical import.

Prof. C. S. Sherrington's paper on "Physiology; Its Scope and Method" does not deal with even this subordinate problem of method, but is an interesting exposition of the mechanism in the body for maintaining an equilibrium of animal heat. Prof. W. F. R. Weldon's paper on "Inheritance in Animals and Plants" likewise, while treating in an interesting way of certain phases of the statistical method in science, deals in the briefest possible fashion with its ostensible subject. The next two papers, that of Prof. W. McDougall on "Psycho-physical Method" and that of Prof. A. H. Fison on "The Evolution of Double Stars," represent the book at its best; the latter paper especially (while itself making no explicit mention of method as such) inevitably stimulates the thoughtful reader to a reflection on the methodological implications. This lecture and the three concluding ones on "The Evolution of Currency and Coinage" by Sir Richard Temple, "Archæological Evidence" by Prof. W. M. F. Petrie, and "Scientific Method as Applied to History" by the editor, combine to raise the one clear issue on the side of methodology in the book, viz., the difference in point of departure and kinds of proof between the historical and the mathematico-physical sciences. The problem is but stated; it is not discussed. But this in itself would repay the reader who is interested in the methodology of science.

The *Annales de Géographie* for March contains the first of a series of articles on the Philippines, by F. Maurette, a summary of the facts contained in the reports of the census of 1903 and of the Philippine Commission. In this he treats of the physical geography and climate of the islands. Paul Le Cointe describes the configuration of the little known part of Brazil lying to the north of the Amazon, and gives some interesting facts as to the amount of deposits in the valley from the erosion of the hills. A remarkable map showing the results of his explorations during fourteen years, together with those of other travellers, accompanies the article. The much debated question as to whether the level of the Mediterranean has changed in historic times is decided in the negative by L. Cayeux, who bases his conclusions upon personal investigations in the islands of Delos and Crete. The other contents include a study of the region of the sand dunes in the Sahara illustrated by phototypes, and of a remarkable valley in Algeria.

The *American Astronomer* is begun with vol. i., No. 1, April 15, issuing from Marlborough, Mass., and edited by William D. McPherson. It is a four-page monthly, devoted to news from the observatories, reports of observations, discussion of problems, reviews of current literature, personal notes, book reviews, reports of astronomical meetings, etc. In short, it aims to be the practical astronomer's newspaper. Dr. Joel Metcalf of Taunton has the only original observations published in this initial number—many new asteroids of his own finding. Two new large telescopes are projected, a twenty-four-inch refractor for Swarthmore, and a thirty-six-inch reflector for Ann Arbor. Prof. D. P. Todd's forthcoming expedition to the Andes is noted in a paragraph, and the annual reports of the Carnegie Institution and Harvard Observatory.

The Royal Academy of Sciences in Berlin has just sent out a special research commission to the West Indies, consisting of Prof. W. Kükenthal, director of the Zoological Institute in Breslau, and Dr. H. Hartmeyer, of the Zoölogical Museum in Berlin. Its object is to make collections of both land and water fauna, and to study certain kinds of fish systematically. The researches will be extended to the Lesser Antilles, Cuba, and the Tortugas Islands, the last mentioned at the invitation of the Carnegie Institution.

Drama.

ALLA NAZIMOVA.

That Alla Nazimova is an actress of the first class, by virtue of natural aptitude and artistic accomplishment, cannot be doubted, but whether she possesses the highest order of histrionic genius, that is to say the tragic, is a question that yet remains to be answered. The impulsive verdict of those enthusiastic admirers who accepted her performances in the Russian drama as proof of her supremacy is not conclusive. To most of these eulogists at any rate Russian was an absolutely unknown tongue and, in such a case, susceptible observers are only too apt to take *omne ignotum pro mirifico*. Vivid pantomime and passionate declamation are not necessarily evidence of an inspired or noble interpretation. Neither in Ibsen's Nora nor in his Hedda, and certainly not in the Countess Nina of Roberto Bracco's "Infidele" ("Comtesse Coquette") is there any product of intellectual, moral, or emotional greatness to employ the highest resources of the actor's art. The very essence of these characters is either common, debased, or trivial. Manifestly, they require no extraordinary powers for their comprehension or expression. Each of them has been played effectively and satisfactorily by actresses of second-rate capacity. But nobody, on this side of the Atlantic, has embodied them so brilliantly as Nazimova, with such finished technical skill, such distinctive individuality, or such bold and harmonious coloring. She may not always have realized the ideal of the author—her Hedda, indeed, was a complete perversion of it—but, for the present purpose, that is a matter of very small importance. The significant point is that she demonstrated her ability to conceive and vitalize three strongly contrasted types of womankind: a child wife of good natural instincts, but conscienceless through lack of moral training; a malignant degenerate, and an arch coquette, insatiable in conquest, but proof against the temptation she provoked. In spite of her striking personality she made of each of these personages a separate entity, clearly and sharply defined, which could not at any moment be confounded with either of the others.

And this effect she created by the sheer force of sustained impersonation, by natural and appropriate changes of carriage, gesture, and action, without adopting the cheap expedient of disguise, exaggeration, or studied eccentricity. She is not altogether devoid of mannerisms, but none of those which she has is so peculiar or so idiosyncratic as to weaken the illusion of the assumed personality. In respect of versatility it is tolerably safe to declare, even now, that there is no actress known to the American stage who can approach her. She is worthy of comparison, in this regard, with Novelli himself, and it is a rather humiliating reflection that it is necessary to go to the foreign stage for examples of a faculty supposed to be inherent in all true actors. The explanation, however, is simple. Novelli and Nazimova both learned their art by long labor in stock companies. But versatility in itself is not an assurance of greatness, or Novelli might be the equal of Salvini. The supreme test lies in the interpretation of the passions or pathos of nobler natures than are to be found in the social dramas of Ibsen or contemporaneous sexual comedy. Until Madame Nazimova has passed through some such ordeal her exact artistic position cannot be determined.

Harrison Grey Fiske has bought the stage rights of Percy Mackaye's poetic tragedy, "Sappho and Phaón," and will produce it next season with Bertha Kalisch in the character of the heroine. Mr. Mackaye by his "Joan of Arc" has demonstrated his ability to write dramatic poetry. In the new piece there is only one scene, the exterior of a Greek temple overlooking the Ægean Sea, which will be seen in the effulgence of full daylight, under the midnight moon, and at dawn. Whether the play succeeds or not, the presentation of a literary and imaginative work is an encouraging sign.

The new "fantastic comedy," by William J. Locke, "The Palace of Puck," which has just been produced at the London Haymarket Theatre, seems to have proved somewhat of a disappointment. Its object is to contrast representatives of the artistic world with those of the suburban Philistia, but the types of both seem to be entirely theatrical and conventional.

The Anderson Auction Company of this city will sell, on April 22, 23, and 24, two sessions each day, the library of Charles N. Mann of Philadelphia. The material is mainly dramatic, and includes collections relating to David Garrick, Colley Cibber, Jeremy Collier, Edwin Forrest, and the history of Covent Garden and Drury Lane and other London theatres. Among rarities are Goldsmith's "Good Natur'd Man," 1768, and "She Stoops to Conquer," 1773; "The Life and Memoirs of the late Ann Catley," 1789; Dunlap's "The Father," Philadelphia, 1789, first edition; Godfrey's "Juvenile Poems," Philadelphia, 1765; Prynne's "Historio-Mastix," 1633; Rainolde's "Overthrow of Stage-Plays," 1629; and Mercy Warren's "Poems," Boston, 1790, with manuscript corrections apparently by the author. There are several extra-illustrated books. The second part of the collection, comprising engravings, autographs, and play-bills, will be sold April 25 and 26.

Music.

Ratschläge für Aufführungen der Symphonien Beethovens. Von Felix Weingartner. Leipzig: Breitkopf & Härtel.

The Irishman who, on being asked whether he could play the violin, replied that he didn't know, as he had never tried, had about as clear an understanding of the matter as a great many concert-goers have of the functions of an orchestral conductor. So far as they can see, anybody could do what he does—rap his desk for silence, and then wave his bâton or his hands to make his men keep time. There have even been operatic managers who could not be made to comprehend the importance of the conductor until experience taught them. Oscar Hammerstein is not one of these; he was wise enough to engage Cleofonte Campanini at $12,000 for five months at the Manhattan Opera House, and found him a great deal cheaper than a $1,000 man would have been, as he became a greater attraction than any of the singers, with perhaps two or three exceptions. Wassily Safonoff got $12,500 for conducting the eighteen Philharmonic concerts of the season now closing and he was worth it; the hundred members of the orchestra have received the unprecedented dividend of $350 apiece.

What is it that makes the conductor such an important personage? An eloquent answer to this question may be found in Weingartner's "Suggestions for Performances of Beethoven's Symphonies." The eminent Berlin conductor devotes 197 pages to a discussion of the proper way of interpreting these nine works, and every one of his pages illustrates some phase of the diverse knowledge and skill required of an orchestral leader. What the auditor sees in the concert hall is merely the pilot turning his wheel. But as the sea pilot must know his ocean bottoms thoroughly, so the musical pilot must have fathomed all the depths of his scores. He must know more than one coast, too—must be at home equally on German, French, Russian, and other territory. He must be thoroughly acquainted with the peculiarities of all the great masters; in the words of Weingartner, "a great conductor must unite in himself as many personalities as there are masterworks for him to interpret."

Most difficult of all the great masters to interpret satisfactorily is Beethoven. Not that his music is deeper or more intricate than that of some other composers. What makes it difficult is that, largely through Beethoven's own fault, there is frequently a lack of lucidity if the notes are played just as they are written. Beethoven was deaf during the second half of his life, which prevented him from always correctly estimating his color values; he was, moreover, hampered in the natural expression of his thoughts quite frequently by the fact that some of the instruments in use in his time, notably the horns and trumpets, were unable to play certain tones; this caused him suddenly to break off a melody assigned to them and give it to another, to the detriment of clearness. Wagner was the first who had the courage to retouch the Beethoven scores, saving the melodic curve by using modern instruments. Beethoven would have doubtless done the same had he had these modern instruments, yet Wagner was violently abused by the purists.

Times have changed. Wagner applied his method of retouching chiefly to the ninth symphony, which needs it most; Weingartner has now applied it to all of these works, and apparently not a voice has been raised in protest. He does not always agree with Wagner, and he is inclined to sneer rather unnecessarily at Wagner's pupil Bülow, whom he accuses of sensationalism and other dreadful things, at least in the last years of his life. He is a believer in modifications of pace, where they seem advisable, though not indicated by the composer; he rejects Beethoven's own metronome marks in many cases as misleading or even impossible, and he agrees with Wagner as to the much-disputed tempo of the third movement of the eighth symphony. He indicates where certain groups of instruments should be doubled, for the sake of balance and clearness; calls attention to the fact that what is advisable in one hall may prove unwise in another. He gives his reasons in detail why the soloists and the chorus needed for the last movement of the ninth symphony should be on the stage from the beginning of the whole work, instead of interrupting the continuity by coming in, as ordinarily, just before the last movement.

A particularly subtle illustration of the conductor's function occurs on p. 171, where Weingartner calls attention to the fact that in a certain passage Beethoven, oddly enough, assigns a difficult solo to the fourth horn player. Weingartner advises its being given to whichever of the four hornists plays best. And on another page (113) we have an eloquent reference to the demands made on the conductor's emotional side. Referring to a certain passage in the finale of the seventh symphony, the author declares that the effect designed can be produced only if the conductor has the power to kindle in all the players, for the production of a jubilant sonority, an overabundant outpouring of energy—a process requiring a degree of devotion and willpower which is both physically and mentally most exhausting. "He who conducts these pages without sacrificing part of himself, will miss fire."

Now that "Hänsel and Gretel" has achieved the distinction, two years in succession, of having had more performances at the Metropolitan Opera House than any other opera, the other works of Humperdinck are more likely to receive attention. His latest production is a "Shakespeare Suite," made up of pieces connected with scenes in the "Tempest," "Winter's Tale," and "Merchant of Venice." It had its first performance at a recent Berlin concert, and the critics praised it for the elegant structure of the pieces, the beautiful orchestration, and the gayety of the shepherds' dances.

While no composer is more popular in the concert hall than Tchaikovsky, his operas, nearly a dozen in number, have not achieved much success outside of Russia, with the exception of "Eugene Onegin." Recently the Berlin Royal Opera made an attempt with "Pique Dame." The first act fell flat, but with the second the audience began to be more interested, and the final verdict was favorable, notwithstanding the fact that, as one critic said, Tchaikovsky is weakest where he ought to be strongest—in dramatic climaxes.

Weber died before he could rewrite his last work, "Oberon," which he composed in haste for London during his fatal illness. There is so much exquisite fairy music in it that every now and then some German musician attempts to rescue the whole opera by editing it. Some years ago Josef Schlar made an effort of this kind, but it was not appreciated. A greater man, Gustav Mahler, has now undertaken the task. His version of "Oberon" will be produced at Vienna.

Among the leading articles in the April *Etude* are the following: "Making a Community Musical"; "Considerations on Foreign Study"; "Technical Delusions"; "Dangers of Thoughtless Automatic Practice"; "Aim and Scope of Music for the Left Hand Alone"; "Rubinstein in His Classroom." There is also a translation of an essay by Heinrich Pudor on the "Control of Nervousness in the Musician."

Art.

THE CARNEGIE INSTITUTE EXHIBITION

PITTSBURGH, April 15.

Not only has Pittsburgh been supplied, by the liberality of Mr. Carnegie, with far ampler and finer galleries than any we have in New York—she supplies the crowds to fill them. Thirty thousand people are said to have visited the Institute yesterday afternoon, the first Sunday after the opening of the new building. Of course, this is an exceptional occasion, but I am assured that fifteen thousand is not an unusual number of visitors for the first Sunday after the opening of the annual exhibition.

More than five hundred pictures are hung in the exhibition, yet there is some space around each picture, and no picture is hung very high. All are well in sight, and well lighted. The collection has a special interest in that so considerable a part of it comes from abroad, giving an opportunity to compare the work of some of the most conspicuous painters of other countries with that of our own men. It is not a strictly contemporary exhibition, there being a sprinkling through it of pictures by painters no longer living, and of pictures painted some time ago by still living men, but the bulk of it is fairly enough representative of the current work of today. Of the American work by far the greater part has been seen already in New York, for our own exhibitions, in spite of all difficulties, remain the only ones in this country in which most of the pictures shown are seen for the first time.

The effect of some of the earlier pictures, hanging here among those more recent in date, is very interesting. Here are Boudin, Monet, Renoir, Sisley, Pissarro, represented by pictures which were thought revolutionary in their day, and which now seem very sane, very quiet, almost classic. Boudin, to be sure, was always gray in color, and never impressionistic, except in the disdain of detail, but just beside his view of Étaples, painted in 1886, hangs Monet's The Seine at Lavacour, painted in

1880, and it looks almost as quiet as the Boudin. It is a little gilded with time, but it can never have been raw or extreme in color. It is spacious, luminous, silvery; not more vague in form than many a Corot; showing a clear sense of arrangement. It contains no brown—that is all the revolution marked by it. The Renoir looks merely feeble and inefficiently pretty; it would be rococo if it could. But Sisley's Terrace at St. Germaine-en-Laye, painted in 1875, is grave, almost austere, admirably and thoroughly drawn, with every yard of earth accounted for, sober in color, without a violence of surface or a gap in its completion.

The authoritative air of pictures once so fiercely discussed bids us beware of rashness in our present judgments. Is it possible that what seem to us the eccentricities of the moment will, in another thirty years, take their place in this same easy way? Or is it not possible that these same eccentricities of to-day lend, by their extravagance, an air of conservatism to works which still retained some elements of the art of a great past? The earlier impressionists founded their art upon the academic tradition from which they broke away, and owed a great part of their strength to that against which they protested. What will be the result of an art which is in turn founded upon the work of these impressionists, and which has never known their discipline? And it is not possible really to judge the art of to-day by this, or by any one, exhibition. The pictures are likely enough to be here because of a conspicuity due as much to their faults as to their merits, and we cannot tell what good and honest work is doing in the world that has not found its way here. But the exhibition, as one sees it, gives certain general impressions, and one can but record them with a word of caution.

The strongest of these impressions is that beautiful painting is hardly any longer attempted save in America. It is not merely that the finest things here, from the great Sargent and the great Thayer, hanging opposite each other in one of the large galleries, to small pictures in unregarded corners, are by Americans; it is that a love for the art itself, for beauty of workmanship, beauty of color, beauty of tone or line or arrangement, seems almost extinct in the European schools. The French and German pictures here are blankly commonplace and photographically realistic, or they are sensational, brutal, decadent. The English do better, and send some bits of real enough art, not greatly successful, but art, nevertheless; in which beauty has been the principal aim. But every canvas that reaches real distinction, every picture that gives one pleasure in a high degree from its perception of some form of beauty in nature or its intrinsic quality as a work of art, will be found to bear an American name.

One of the most curious things in the painting of the day is the utter demoralization of the sense of color. The impressionists are supposed to have "liberated the palette" and to have brought back natural color to an art that was lost in bitumen. What has come to their descendants? Here is chalky and plastery color, muddy and inky color, darkness and dirt and grime, varied by an occasional explosion of fireworks. It would seem that the numbed color-sense of some of these men no longer responded to anything short of raw vermilion. The study of the later nineteenth century was the study of light and air. In some strange way it has brought these men of the twentieth to the denial of both. Their canvases are flat and hard and airless, as lacking in luminosity as they are in quality. Look at Cottet's Cathedral of Segovia, with its naïve red and black to represent the evening glow and the shadow; at Dauchez's Highroad, white with black shadows; at Simon's Woman with a White Glove, in an atmosphere of ivory black. Is this the color and light we have regarded as the mark of modern painting? These pictures have no more color than had those of the victims of asphaltum. Or, take Besnard's Portrait of Madame Besnard and Portrait of My Children. The first is plain black and white; the other has interesting color and interesting character, and it is well drawn also, but it has no atmosphere. The back of the room is as near you as the front, and the landscape is as near as either. With all this study of the tricks of light and air the feeling of light and air has disappeared. For Besnard has studied these things—apparently, the others have not.

Three pictures more may be cited as typical of the faults of the foreign painting represented here: Morot's portrait of Robert S. McCormick, of its crude realism; La Touche's The Bath, of its sensationalism; Stuck's Saharet, of its decadence. Morot's portrait is drawn with photographic accuracy, forced in light and shade almost to pure white for the lights, violently modelled. Everything seems to have been sacrificed to the mere illusion of corporeal presence. It "stands out," and it is like—horribly like—that is all. It is impossible to deny cleverness to Gaston la Touche, to whom the jury awarded the medal of the first class, but one could wish it otherwise employed. Perhaps there is a satiric intention in this confusion of epochs, of sedan chairs and rococo fountains, with a naked satyr and a badly drawn woman just removing the last of her very modern garments. But, putting aside all questions of subject or of artistic ethics, the curious, vermicelli-like handling; the hot, red and yellow color; the lack of substance or surfaces anywhere—these are far from pleasing. But the work is charming by comparison with the black-ringed eyes, the green complexion, the twisted vermilion lips with pure black dots at the corners, of Stuck's Saharet. It is a picture which suggests nothing but disease.

One must mention that there is real beauty and refinement, both of character and of color, in Aman Jean's portrait of a lady, and much sound painting, of the sort that has always been good since the Dutchmen practised it, in Joseph Bail's Bakery in Pontivy, and then we may pass on to the American pictures.

The largest, and, in a general view, perhaps the most important of these, is Mr. Sargent's portrait of the four professors of Johns Hopkins University, but I cannot think it altogether the happiest effort of its brilliant author. No one else now painting could have produced it, but Mr. Sargent has done things one likes better. The composition is a little restless, as if a breeze were agitating the robes and scarves of the academic costume, and the contrast between the rather cold black of the gown, and the warm tones of the background is a trifle sharp. It is a prodigiously skilful work, or it would not be his, but perhaps there is more pleasure to be got out of his portrait of the Hon. Mrs. Frederick Guest or his fresh sketch of William Thorne. Even the heads, except that to the extreme left, seem less vitally realized than usual.

Directly opposite this group hang two pictures by Abbott H. Thayer, both well known, the Caritas belonging to the Boston Museum and the Portrait of a Young Woman lent by the Metropolitan. There are lacunæ in both—unexpected lapses in continuity, changes in color not quite accounted for—but both are works of art and of very fine art, delicate and strong, noble and refined. The grand silhouette and large pattern of them, the restrained and beautiful color, the repose shot through with energy, the justness and beauty of line and value—these things strike the keynote of what seems an American quality to-day—the devotion to art and to the production of beauty. Or, take, instead of these large canvases, a very small one that hangs next the Sargents, Dewing's little picture called The Letter. Some hundreds of years hence the historian of our time may be puzzled by Mr. Dewing's treatment of our life, and wonder if the ladies of the day usually sat in such bare rooms or wore low-cut dresses in the daytime; but what does it matter? It is a fantasy, but what a delicate one! What dainty sureness of line, what exquisite modulations of faint color, what discrimination of values, what beauty of the pigment itself, of mere paint, treated with a sense of its possibilities as a material, laid thinly and fluidly with due respect to its nature, and responding, as even dead materials do, to loving treatment! If you wish for a more robust handling, look at Miss Cassatt's Reading Lesson; the color, with its combination of orange and pale blue, a trifle shrill, perhaps, but with a tart pleasantness; the mother's head, good in type and thoroughly drawn and modelled; the paint simply and naturally laid on, softly solid, free yet firm, a delight to the eye and a temptation to the touch. Look at the close tissue of Brush's early painting of a Sioux Brave; at the virtuosity, subjected to the rendering of character, in Wiles's portrait of Henry Wolf; at the sure and early brush-work of Miss Beaux, in a whole group of portraits, equal to Sargent in freedom, superior to him in sense of color, only inferior in that grasp of form, that absoluteness of draughtsmanship, which is his supreme distinction. In all these canvases, various as they are, there is evidenced the love of painting as an art, the desire to do things beautifully, the respect for the trade, which seem to be fading from the world.

You may find the same qualities, shown still otherwise, in the work of Weir and Hassam. The textures are rougher here and more rugged. The ideal of material beauty is different, but beauty is what is sought. Mr. Hassam's three pictures are none of them quite his best—in the largest, called Aphrodite, there is a rigidity and sharpness of edge hardly to be expected of his method, and he has not quite succeeded

in enveloping his figure in air. But look at the authority of the pattern, the determinate decorative substance. It is conceived, thought out, seen. Things are where they should be—where they must be. There is no haphazard about it; this "impressionist" is, above all, a composer. As for Mr. Weir, how infallibly he is the artist we all know. He may fail, now and then, to express his intention, but the intention is always of the highest. You feel in him, always, the utmost sensitiveness to beauty, the utmost sincerity of aim. At his best, no one is better and even his failures are lovable. His June, his Summer Evening, his Gray Gown, show him nearly at his best, subtle, delicate, refined, yet with a frank simple-mindedness that is a great part of his charm. Now and then, perhaps, he has added to these qualities a breadth and force that have placed him on a still higher level, but as he is seen here he is a very fine painter.

It is not my intention to attempt a mention of all the good pictures. I have said nothing of Homer or Schofield or Redfield or Ochtman or Foster, and I shall say nothing of the Whistlers or of Mr. Eakin's sturdy portrait of Prof. Leslie Miller, which took the Proctor prize at the Academy of Design a year or two ago, and has now taken the second prize here. All these and many other things I must overlook. I have chosen for comment those pictures which came first to mind as illustrations of my thesis. Doubtless I have neglected good pictures by foreigners also, as I have certainly neglected bad ones. But the large general impression left upon my mind by the exhibition is this—whether it is due to prejudice and inflexibility on my part, or to an actual state of facts—that the schools of painting on the Continent of Europe are in a state of decadence; that the British painters are in a healthier state than their Continental brethren; and that the best and most hopeful work being done anywhere to-day is being done by Americans, and largely in America. KENYON COX.

"Le Fonti di Siena e i loro Aquedotti," by Fabio Bargugli Petrucci (Florence: Leo S. Olski), is one of those painstaking works in mediæval archæology of which Italy produces so many. No less than sixty public fountains are described and illustrated. All legislation concerning water supply is epitomized. The courses of Roman aqueducts are traced, and even plans that were begun but left unfinished are duly charted. Since the fountains were often (notably Quercia's Fonte Gaia) works of art, the study touches art history at many points, and since the story of aqueducts is an index of that of civilization, the book must be reckoned with the minuter works in *Kulturgeschichte*. The survey extends from the earliest times to 1555, occupying two stout volumes in folio, of which the second consists exclusively of documents, with an index. Quite apart from aqueous concerns, the book will be useful to all who study narrowly the past of Siena.

The same publisher announces for publication this spring an important four-volume work by Prince d'Esseling, "Les Livres à Figures Vénitiéns." Ever since the late Dr. Lippmann's excellent treatise on early Italian wood engraving, there has been a growing interest in that charming form of graphic design. Nobody of late years has contributed more acceptably to this branch of bibliography than Prince d'Esseling, and this forthcoming work will sum up his studies of a lifetime. He will review 2,600 illustrated books from the beginnings to 1525. A novel kind of research will be the tracing of the migrations of the early wood blocks. The Venetian inventions were widely plagiarized; frequently the blocks were circulated, and Venice made appropriate reprisals upon the foreign printers. There are to be four large folio volumes, the typography, paper, and illustration being of the finest. The edition is limited to 300 copies, and the subscription price is 125 francs a volume, for such subscribers as are registered before the appearance of the first.

Several archæological discoveries of interest are reported from Italy. In Cattolica Eraclea, in Sicily, the foundation walls of a magnificent theatre, dating from the classical age, have been uncovered, and extensive researches have been begun. In Ancora a number of Roman tombs have been found, containing, among other things, two beautiful silver vases, a number of urns, with ashes of cremated persons; gold earrings with smaragd stones. Signor Pellegrini, the director of the Museum at Ancora, believes these finds belong to the third pre-Christian century.

The Metropolitan Museum of Art has lately increased its accessions of work by American artists by purchase of five bronzes, four by Frederic Remington, and one by Edward Kemeys; and four paintings, one by Eastman Johnson, The Corn Husking, and one by William Gedney Bunce, Morning View in Venice. The other two canvases, which are perhaps the most important of the recent accessions, are portraits by Gilbert Stuart of Don Josef de Jaudenes y Nebot, Spanish minister to the United States, and Doña Matilde Stoughton de Jaudenes, his wife, signed and dated September 8, 1794.

Paintings by Emil Carlsen, William M. Chase, Arthur B. B. Davis, Ernest Lawson, Kenneth Hayes Miller, F. Luis Mora, James Wilson Morrice, John Sloan, John H. Twachtman, and J. Alden Weir will be shown till April 20 at the Gallery of the New York School of Art. Lithographs by Whistler are on exhibition at the Grolier Club till April 27; and work by representative American engravers will be shown at the Lenox Library till June 1. Pictures by William L. Lathrop will be on exhibition at Montross's till April 27; miniatures by Hugh Nicholson are shown at Fishel, Adler & Schwartz's; and paintings by Josef Israëls, Jacob Maris, Weissenbruch, Blommers, and De Bock at C. W. Krauchaar's.

The pictures of the late Stanford White, offered at auction in this city last week, brought rather low prices. A Portrait of Kitty Fisher, attributed to Sir Joshua Reynolds, brought $3,100; Portrait of the Earl of Dorset, early Spanish school, $3,200; Portrait of a Young Lady, Juan Carreno de Miranda, $2,350.

James Clarke Hook died in London Monday night. Born in London in 1819, he entered the Royal Academy as a student in 1836, and at once gave evidence of ability. As early as 1845 he was awarded the gold medal for an historical painting: The Finding of the Body of Harold. His early work was inspired chiefly by subjects from English history, but after an absence from England of eighteen months he turned his attention to scènes from Italian and French history and romance, with occasional reference to scriptural themes, and to Shakespeare's Italian subjects. The following pictures, all of which were exhibited at the Royal Academy, belong to this period: Pamphilus Relating His Story, 1844; Bassanio Commenting on the Caskets, 1847; The Chevalier Bayard Wounded at Brescia, 1849; A Dream of Venice, 1850. In this year, 1850, Mr. Hook was elected an associate of the Royal Academy, and ten years later he received the full honors. About 1855 he abandoned the romantic and historic vein and turned to pastoral and modern subjects. Of this later style—the middle period—the following are well known examples: The Birthplace of the Streamlet, The Market Place, 1855; A Pastoral, The Coast Boy Gathering Eggs, 1858. In the late fifties, Mr. Hook entered upon work by which he is best known, that is, as a painter of marine subjects. His work of this period won him wide popularity, due in a measure to the homely nature of his themes. His pictures of the sea are almost without exception anecdotal in character, and, indeed, the same comment may be made of all his work. Among the productions in his later style should be mentioned, Leaving Cornwall for the Whitby Fishing, 1861; The Trawlers, 1862; Salmon Trappers, Norway, 1871; The Samphire Gatherer, 1875; Little to Earn and Many to Keep, 1879; The Sea-weed Raker, 1889; Low Water at the Tidal Crossing, From the Shore to the Field, exhibited at the Royal Academy in 1897; and Water Cresses, 1899.

Three French artists have recently died. The first is the sculptor, Jean Barnabé Amy, who was born at Tarascon in 1839, and studied under Dumont and Bonnassieux. His first contribution to the Salon was his La Béatitude, 1869. In subsequent years he exhibited a number of portrait busts, and latterly he had been showing some grotesque and satirical "masques." Among his statues are L'Innocence, Le Remords, Thiers couronné par l'Histoire, and Le Tambour d'Arcole. Léon Richet, who died in Paris March 26, at the age of sixty-three, had studied under Diaz, Jules Lefebvre, and Boulanger; and he followed chiefly the style of Diaz. He exhibited his first landscape at the Salon of 1869; and he drew his later subjects largely from Normandy, Picardy, and the forests of Fontainebleau and Compiègne. Jules Monteigner, who died March 27 at Dompierre-sur-nièvre, where he was born in 1836, was well known as a painter of genre pictures and portraits.

Finance.

AN "APRIL CROP ESTIMATE."

When the stock market recovered from its low prices of the second and third weeks of March, and the panicky state of mind in Wall Street appeared to be at an end, the upward movement continued with little interruption for a fortnight. Such

a recovery is usual, the reason being that a panicky decline is invariably overdone. At some point in the fall, a level of values is reached which attracts real investors; when they arrive, speculators for the decline, who have borrowed for delivery stocks which they must return, begin buying. Thus there is a partial retracing of the lost ground. It rarely continues long, because the real investor stops buying when prices have risen to a less inviting level, and because the speculators for the decline have soon "covered" their contracts for delivery. When this point is reached, a new decline, more or less prolonged, is likely to follow; and such a decline has gone on during most of the present month.

This series of movements, it will be seen, is more or less automatic. It is Wall Street's nature, however, always to demand some new explanation for a change in the course of prices, and on the present occasion the cause assigned most commonly on the Stock Exchange was reported damage to the crops. The Government's Agricultural Department had issued, on Wednesday of last week, an estimate of the early condition and promise of the wheat crop. That estimate was favorable; it showed a condition considerably better than that of a year ago, when a total wheat yield never but once exceeded was the outcome. Reduced to figures, the "condition" was better than that reported in April, by the Government, in any but five of the past twenty years. But the "condition estimate" for the "winter wheat crop" as a whole, which the Department gives out on April 10, is based on reports from the various producing points, and these are mailed to Washington on April 1. During the nine intervening days, weather in the wheat belt may be so unfavorable that the April first estimate may be misleading; and this was exactly the assertion current in the grain market this past week. Large grain houses, with speculative connections on the produce exchanges, send their own experts into the wheat district to find out actual conditions. Their dispatches, it was declared, showed great damage to the growing wheat since the Government figures were compiled. Dry weather in the Southwest, where winter-sown wheat, just emerging from the ground, needs abundant moisture, and ravages by destructive insects, were the causes alleged. While Stock Exchange prices were going down, wheat prices in the speculative markets went up, last week, two cents per bushel.

This "crop scare" was probably much exaggerated; it was in the interest of speculators, both in wheat and in stocks, to exaggerate it. But since more will be heard, between now and the autumn, of "crop reports," "condition percentages," and "estimated yield," it will be interesting to see just what these expressions actually mean. The Agricultural Department maintains a Statistical Bureau, whose officers receive the estimates from the field. Those estimates come from various sources. There are "State statistical agents," each of whom has a corps of subordinate experts; "township correspondents," who report on crop conditions in their own neighborhood; and a multitude of business men—merchants, bankers, millers, manufacturers of fertilizers, and farm machinery—whose location or trade connections give them opportunity for correct observation. Some of these agents are on salary; more do the work gratuitously. The system of a dozen years or so ago, when the Washington statistician's main reliance was the postmasters at agricultural towns, who gossiped with farmers and framed their own deductions accordingly, has long since been abandoned.

What frequently puzzles the reader of government crop estimates, however, is the "percentage." Last week, for instance, winter wheat was barely above the ground; the Department reported that "the crop's condition is 89.9 per cent." What did this figure mean? Indication of a perfect crop—that is, of a yield to the full capacity of the district reported on by a given correspondent—would be denoted by 100. This figure would not mean the same promised yield of bushels per acre in one town as in another; the best that a field of inferior richness would produce would run far below the best of the Red River Valley. Observation through a series of years will establish in each case what is a perfect crop, and each field correspondent reports, by his "condition percentage," how far short of that yield the growing crop seems likely to fall. Thus the Department has only the task of averaging the percentages, sometimes with more weight allowed to one group of experts than to another. The 89.9 percentage of April 10 means that the whole winter wheat belt promised to produce 10.1 per cent. less than the best it has shown itself able to do. With this information, the Produce Exchange expert whips out his pencil and figures out what the average yield per acre promises to be. In December the Department, having asked the correspondents how the acreage devoted to winter wheat compared with that of the previous year, worked out an increase of 1.1 in acreage. The ascertained acreage for the previous harvest was 31,312,000 acres. The market, adding 1.1 per cent. to that acreage, and multiplying the result by what the April report indicates, arrives at its "April forecast" of the winter wheat harvest of 1907.

What, it may be asked, does this forecast amount to, in the way of throwing light on the actual yield of the year? So far as the early wheat crop itself is concerned, the "condition estimate" has considerable value. Since the crop is not absolutely out of danger until the latter part of June, there is of course opportunity for serious impairment through bad weather or insect pests. There are instances in which the April condition estimate has been cut down 10 or 15 per cent. in the monthly estimate for July. Nothing would seem more natural than such a result, in the vicissitudes of the American climate. Yet the April percentage has, on the whole, been singularly well maintained. Only in three out of the twenty-four past years has the condition estimate been reduced, between April and July, as much as 10 per cent.; in four years, of the period, the July figure was higher than April's.

But the forecast of "total indicated yield," deduced by the market from the April condition estimate, is worth little. The estimate of acreage planted, which is used necessarily in such calculations, is that compiled by the Government at the opening of December. It takes no account of "winter-killed" wheat, in regions where "snow-covering" has been inadequate, or where floods and frost have destroyed the tender plant. Not until the monthly crop report of May is this essential item corrected. Last year, the May report found that on 1,718,000 acres, or 6 per cent. of the December-planted area, the wheat had been destroyed. In 1905, the loss was 4⅝ per cent., or 1,432,000 acres; in 1904—when January and February in the Southwest were marked by unusually destructive weather—15⅜ per cent., or 4,932,000 acres, were reported as abandoned between December 1 and May.

Clearly this acreage reduction, of which the precise results are not yet known, must cut down materially any April estimate of expected yield. Furthermore, though the early crop makes up the greater part of this country's wheat harvest, the so-called spring wheat, of whose condition no estimate appears until June, and whose harvest falls in August and September, contributes some 40 per cent. to the total yield. These elements of doubt make it plain enough why the speculators in the grain exchanges use the present interval to convince their market that supplies will be short this coming autumn, and prices higher; while speculators in stocks insist that with crop yields below expectations, farmers will have less grain to sell, railways less to carry, and prosperity, therefore, a less favorable basis. But the read-

The Nation.

NEW YORK, THURSDAY, APRIL 25, 1907.

The Week.

President Roosevelt never did a finer thing than his reply, Wednesday morning, to the protesting labor unions. They have been showering him with demands that he retract his statement that Moyer, Haywood, and Debs were "undesirable citizens." Now, as we have said, we think it was indiscreet for the President to make that public reference to men on trial for their lives, but he has certainly made up for the indiscretion by a manly and courageous utterance. His retort upon the labor intimidators is overwhelming. If his phrase could be twisted into an attempt to prejudice a fair trial of the indicted men, what must be said of their excited and inflammatory appeals? "Death Cannot, Will Not, And Shall Not Claim Our Brothers" was on the very letterhead of the protest sent to the President. Mr. Roosevelt points out with great force that this and the other banded activities of the labor leaders can bear no interpretation except that they are determined *not* to have a fair trial, and to tolerate no verdict but that of acquittal. Protestations from such men are farcical. Their mouths are shut. And when, in honest indignation, President Roosevelt holds up to public scorn those wicked chiefs of labor organizations whose policy is violence, incitement to crime, and bloodshed, he puts the whole country in his debt. Such a frank and timely deliverance will help to keep alive that ideal of Roosevelt which we all like to cherish.

It cannot be too distinctly laid down that President Roosevelt's removal of Collector Archie A. Sanders of the Port of Rochester, purely for political reasons, as is officially admitted, is directly in violation of his own professions and pledges, as it certainly is of all sound principles of civil-service reform. It is not alleged that Sanders was in any way incompetent or derelict. He was simply "Wadsworth's man," and therefore had to go. Of such ruthless use of public offices, the President has put on record his indignant condemnation. In the brave days when he was a civil-service reformer, he said (1895):

> Removals for political reasons in places where the duties are wholly non-political, cannot be defended by any man who looks at public affairs from the proper standpoint.

Even his afterthought about the duty of using patronage to hold up the hands of Hughes, he had accurately branded in advance. In his *Century* article of 1900, he wrote: "No man is justified in doing evil on the ground of expediency." Also:

> As soon as a politician gets to the point of thinking that, in order to be "practical," he has got to be base, he has become a noxious member of the body politic.

And if anybody says that we ought not to criticise a great and good President for being false to his promises and careless of reform, we have a warrant in his own words. In his valiant essay on "Civil-Service Reform," he spoke of the duty of "all friends of reform" to watch carefully the course of public officials:

> They should be condemned when they do ill; and attention should be called not only to what they do, but to what they fail to do. To an even greater extent, of course, this applies to the President.

It is probable that Mr. Roosevelt did not fully realize the shock and dismay which his action would bring to those civil-service reformers who used to be glad to fight under the same banner with him. He has done many things before to try their faith. He has made some appointments hard to justify; he has "taken care" of too many personal friends. But never before has he bluntly announced such a policy of proscription as he now tells us he means to follow.

In the last number of *Pearson's* James Creelman writes of Secretary Taft with evident admiration, and sets forth his good qualities and his fitness for high office. The article is entitled "The Mystery of Mr. Taft," and what is the great mystery? Why, that "a statesman of stainless name, unshakable independence, and creative and administrative abilities that have compelled admiration throughout the world, should stir so little enthusiasm in the American people"! One can imagine how distasteful such an appeal for pity, mixed with reproach of the people for being blind to his transcendent merits, must be to the hearty, frank, and unambiguous Secretary of War. For the rest, Mr. Creelman's article gives a well-informed and sympathetic description of Mr. Taft's training and public career. Some new material is included. Perhaps the most interesting part of this relates to the Secretary's strong preference for the Supreme Court, yet his putting away that ambition when it seemed to him that duty required him to stay in the Philippines. Mr. Creelman refers also to those judicial opinions of Mr. Taft in labor cases, which politicians have thought would be fatal to his chances. If it so prove, then it is a highly honorable part of the record which will be disastrous. His decision finding the Bricklayers' Union in conspiracy; against the Typographical Union for illegal boycotting; and his granting of an injunction against the Locomotive Engineers were all judicial acts based upon the principles of the Common Law and our charters of individual liberty, as clearly as was his famous decision in the case of the Addystone Pipe Company, perpetually enjoining that illegal combination, too. If these decisions of an upright judge are a bar to political advancement, they will be one more evidence of the premium which politicians put upon "low and crouching men." The politicians are often wrong, however. As in Burke's day, they frequently show that they do not know their own business. And it may yet be that the Taft candidacy will shake itself clear of blundering friends and misguided official sponsors; so that the people, left to their own choice and not prematurely rushed from the White House, will come freely to think of the Secretary as a man in whose hands they might safely place the responsibilities of the highest office.

We are opposed to a large navy, but we believe that such ships as we get should be constructed according to the latest and best methods. Take the case of the two 20,000-ton battleships, of which we have heard so much. The plans approved last week call for a speed of only 20 knots, although the English Dreadnought, which they are supposed to rival, has made 22¼ knots. By great effort, the Department hopes to complete them in three years, which would surpass previous American building records by from one and one-half to two years. But, supposing these ships are afloat and in commission in three years, they will only be contemporaries of some British vessels which will be laid down a year hence. It is idle to expect that the English battleships of 1910 will have only the same speed as the Dreadnought; they may be counted on to be capable of at least 23 knots, for England is already building three armored cruisers of 22,500 tons, with a speed of 25 knots. Again, the object of the Navy Department was to have the "biggest ships afloat." So its experts are planning for vessels 2,000 tons larger than the Dreadnought. But Japan is already ahead of them, since she has placed an order for two 21,000-ton ships, to say nothing of the British cruisers. Thus not even the title "biggest in the world" can be applied to our sea-monsters. So far as their engines are concerned, while no definite announcement has been made, it is understood that our

newest boats are to be provided with turbines. Lest anybody think that this is an original idea, we hasten to say that the Navy Department scoffed at turbines long after they had been tried by the British, and found to be the engine of the future. Fully a year ago the Admiralty announced that on most classes of ships, turbines alone would be installed hereafter. At this time, we believe, only one vessel of the sixteen now under construction for the United States navy is being equipped with turbine machinery. The nine first-class battleships now nearing completion have reciprocating engines, and not one is planned for a speed of twenty knots. Even Germany has adopted turbines for her new vessels, and, as is usually the case, the American merchant marine is ahead of the navy, for there are several turbine steamers, including the Harvard and Yale of a New York-Boston line, ready to go into commercial service.

Not in years has a more notable gathering been held in this city than the Peace Congress, which concluded its sessions last week. Its success was due quite as much to the earnestness of speakers and audiences as to the presence of men of great reputation who of themselves would attract a crowd. The public should not be misled by the manner in which the local press has emphasized an occasional passage at arms, or by the admission to the programme of one or two men who have only just begun to understand what the crusade for peace means. As Mr. Bryce pointed out at the final dinner, there was a remarkable unity of opinion; those present at the sessions were, whether temporarily or permanently, enthusiastically in favor of abrogating war. Intensely practical suggestions abounded. Some of them were of the utmost value, notably President Eliot's appeal for an international police force, with duties of preserving the peace, instead of violating it. In this he but elaborated his recent admirable address to the Boston police, in which he exalted their functions as contrasted with those of mere soldiery whose functions are primarily destructive. The demand for a supreme court for the nations was strongly presented, as were also the various pleas for a better understanding between the nations. Mr. Bryan would advance the brotherhood of man by educating young foreigners here, and then sending them back to heir own homes as ambassadors of peace and good will. The exchange of professors he would supplement by an exchange of students. So far as the resolutions are concerned, the most scrupulous diplomat could not cavil at them. A more permanent and comprehensive international union; the establishment of the Hague Conference and Hague Court as permanent institutions; the drafting by the former of a general treaty of arbitration for ratification by all the nations; the endorsement of the Interparliamentary Union's plan for an international commission of inquiry or for mediation where arbitration is impossible—all these are proposals which are easily capable of fulfilment if the influence of the leaders of world opinion is but thrown behind them. Never was there a cause in which the will could find the way more easily.

Mr. Bryce was not present at the dedication of the Carnegie Institute at Pittsburgh. As yet, however, we have observed no demand, even from Mr. Carnegie, that we therefore declare war upon Great Britain. Many people in this country were not aware of Mr. Bryce's failure to attend the exercises; and those who knew have kept calm. But the matter came up in Parliament Monday, and Mr. Bryce was criticised in both the Lords and the Commons. Lord Leith of Fyvie went so far as to say that "Great Britain had stood aloof, and it would be most disappointing to see the late Lord Pauncefote's great work of reëstablishing a good understanding between the United States and Great Britain endangered by an act of indifference, which might be misconstrued into something stronger." All this, of course, is partly Opposition tactics. Naturally, the Conservatives lose no chance to worry the Government. But beneath the words of Lord Leith lies a somewhat exaggerated notion of the touchiness of Americans. We are proud of our institutions of art and learning, and therefore, so runs the argument, we must be incensed whenever the effete kings and emperors of the Old World are not properly represented at the commencements, anniversaries, and the laying of corner-stones. Whether this view was ever tenable, we shall not undertake to discuss. At any rate, there has been a change since the days of Dickens's Jefferson Brick, and the Americans whom Mrs. Trollope saw. We are proud of our colleges and libraries; we are glad to have distinguished foreigners attend our celebrations; but, if Mr. Bryce, M. Jusserand, or Baron Speck von Sternburg have previous engagements, we are not spoiled children, that we should fly into a rage over an imagined slight.

The historic Massachusetts policy of exempting from taxation the property of educational institutions is attacked by a bill now pending in the Legislature opening to taxation "such real estate . . . as is occupied as a residence by an officer of instruction, administration, or government." This is a bill which would make relatively little practical difference to any of the colleges within the State, and to some, perhaps, none at all; but its very proposal is new evidence of the disposition which has been manifested in some of the smaller college towns of New England to tax certain college property. It is a strange phenomenon that Massachusetts, the pioneer in fostering public education, should join a movement like this at a time when the Western States are treating higher education with unprecedented liberality. While Cambridge and Williamstown are begrudging the sum that would accrue to their treasuries if certain college property were in private hands, every dollar's worth of property in Michigan, Minnesota, and other Western States is levied upon annually for the support of the State universities. Not only that, but these States are voluntarily raising their rate of taxation for education. The Wisconsin Legislature, for instance, recently increased the University tax to two-fifths of a mill on every dollar of assessment. With encouragement of this kind offered in the newer sections of the country, it would be indeed unfortunate if fresh obstacles were put in the way of Eastern institutions depending on private endowment.

Mr. Asquith's budget for the coming twelvemonth, presented to the House of Commons last week, is in several ways an adroit compromise. The Chancellor of the Exchequer had been confronted by a dilemma. On the one hand, the Labor party was urgent in its endorsement of the "old-age pension" project; to which, indeed, the Ministry had already tentatively committed itself. On the other hand, there was a loud demand for remissions in the heavy income tax. At the outbreak of the Boer war the British were paying 8 pence on every pound of income, a tax of slightly more than 3 per cent. In the stress of the Transvaal war the rate went as high as 15 pence. In 1903 it was reduced to 11 pence by Mr. Ritchie, but a deficit frightened his successor, Austen Chamberlain, and the rate was increased to a shiling, a tax of 5 per cent. Every successive Chancellor has admitted that the failure to remit the war buden was unfair, and all have agreed that this heavy tax is largely responsible for the declining market for British Government securities. Nevertheless, fear of another deficit has prevented action, and the present Ministry approached the problem hampered by the counter-demands of the workingmen's party. "Old-age pensions" and a reduced income tax were flatly incompatible; this was Mr. Asquith's problem. He met it by reaffirming the Ministry's belief in old-age pensions as "the most serious and urgent of all demands for social reform," but by granting for the purpose only an investment of $7,500,000 of the surplus, to be the nucleus, hereafter, of the necessary fund. To income-tax-payers, as a whole, he grants no remission, but on

"earned incomes" of less than $10,000 a year he offers reduction from 12 pence in the pound to 9. This lower rate, it will be observed, is still above any exacted in the forty years before the Boer war; and, since it does not apply to income from investments, it may be doubted if the troubles of the "consols market" will be greatly relieved by it. Politically, however, its effect may be considerable. The British Treasury, in a statement compiled a year ago, showed that, out of some 356,000 individual assessments under the income tax, 217,000 were based on an annual income of less than £2,000. To what extent this represented incomes exclusively derived from earnings, is a matter of pure conjecture; but it is reasonable to assume that a numerical majority of the income-taxpayers will be relieved. The fact, however, that relief is so restricted, and that the Socialist element is already protesting against postponement of the promised pension legislation, suggests that Mr. Asquith will have to meet the unpleasant results which usually follow compromises that really satisfy nobody.

The agreement to submit to a joint American-Canadian commission the question of uniform fishing regulations for the Great Lakes and contiguous waters is of vital importance to an industry that on this side alone employs some seven millions of capital, and markets a product of three millions. As in other international disputes, one of the initial difficulties is that a question on which the Canadian authorities have adopted a uniform policy is here handled by the eight States bordering on the lakes in eight different ways. Some of our States have closed seasons; others, using the same waters, have none. Some are active in restocking the fisheries; others do little but catch the fish their neighbors have planted. One of the remarkable assertions made in all seriousness by a correspondent of the Chicago *Tribune* is that the fish themselves have developed an instinct to "seek refuge in Canadian waters." That is certainly evidence of our wasteful policy, from those who should know most about it.

The significant feature about the succession of strikes with which Paris has been visited of late is the comparatively small number of workmen involved. A handful of electricians, about 500 in all, were able to plunge the *Ville-Lumière* into a desolation of darkness. The threatened defection of some 2,000 bakers brought the capital for a moment face to face with partial famine. Then, too, the unfortunate Parisian has just been made miserable by a strike of café waiters. The French labor leaders seem to understand that the general public may be more incommoded by the shutting down of an electric power-house for a few days than the suspension of coal-mining or iron-forging for weeks. The ordinary strike involving tens of thousands of men has been shown repeatedly to be inefficacious. Better policy it is to fight with small but highly organized forces, and to strike at the nerve centres, so to speak, of the enemy. This plan appears to find its fullest development in the contest that is now on for the complete unionization of all branches of the Government service as the speediest means of storming the citadel of the present social order. On this point, the radical Clemenceau Ministry seems to be preparing to fight. A dispatch from Paris tells of the suspension of three postal employees who had joined in an open letter to the Premier protesting against the provisions of the proposed Ministerial bill dealing with Government employees and the right of combination. Of this letter the *Temps* declared: "It is impossible to assume a more impertinent or audacious tone." The Government's bill concedes to public employees the right of combining, for the protection of common interests, into incorporated associations, "free to appeal to the law against alleged violation of their rights by the Administration." The right to strike, however, is denied; or, what amounts to the same thing, they are refused permission to affiliate themselves with the General Confederation of Labor, whose policy, as energetically carried out by its president, M. Griffuelhes, is avowedly revolutionary. M. Clemenceau has by no means an easy task. The central committee organized for promulgating the principles of trade-unionism among Government employees, contains representatives of the "naval reserve men, municipal laborers, employees in the Government tobacco and match factories, the school teachers' union, the postmen's union, the mint, the prison guards, and the custom-house officers."

The elections to the lower house of the Spanish Cortes have resulted in an estimated majority for the Conservative Government of some 120 in a house of 431. The numerical strength of the two leading parties is nearly the reverse of what it was after the general election of 1905, in which the Liberals won an overwhelming majority, only to fritter it away in internal dissensions. In the ordinary course of events, the Maura Cabinet should now maintain itself for a year or two; and the more or less anti-clerical programme of the Liberals, including the projected Associations law and Civil Marriage bill, is, of course, indefinitely postponed. From the figures is would appear that many Liberal voters, disgusted by the anarchy within the party, have cast in their lot with the radical parties. Thus the Republicans and Catalonian Regionalists have increased from 37 in 1905 to 52, while the Carlists have risen from 3 to no less than 13. In spite of the prevailing sympathy with which the nation must supposedly be looking forward to a royal heir, the anti-dynastic influences are by no means to be overlooked.

As to the extent to which anti-Semitism enters into the recent Rumanian disturbances, there is considerable disagreement. Indeed, the whole question of the economic rôle played by the Jews in Rumania is in dispute. On the one hand, one of the leading Jewish citizens of Great Britain has denied that the Rumanian Jews have succeeded in securing control of a large portion of the land, in the capacity of middlemen, and rack-rented the peasants. But the charge is reiterated by the London *Spectator*.

> The majority of these bailiffs are clever Jews, who, armed with the whole powers of the landlords, and backed by the officials whom they "conciliate," demand double, and in some cases triple, the accustomed rents, which were already heavy; and this takes from the people—who, it must be remembered, have no alternative mode of living—the whole product of their toil beyond the barest and roughest means of subsistence, means so attenuated that they are compelled to live in rotten huts and to starve not only themselves, but their wives and children.

The case here is probably overstated, but from what we know of the important part formerly played by Jews in Poland as the lessees and managers of the estates of the nobility, it cannot be far from the truth. When we are told that university professors and students, the schoolmasters, and the professional classes have taken the lead in Jew-baiting, the suspicion arises that the Rumanian educated classes are pursuing the same tactics as those of the early Russian Nihilists under Alexander II. Then many believed that, by inciting the peasants against the Jews, the *mujik* might be aroused from his indifference and torpor to a sense of his needs and rights as against the Government. If the Rumanian Government, as seems probable, did nothing to check the anti-Semitic agitation, it acted foolishly, as events showed; for what the Russian peasant under Alexander II. could not be brought to do, namely, to turn on the government, the Rumanian peasants attempted. Russia, by this time, has learned the lesson. When Plehve stirred up the Christian against the Jew, the Tatar against the Armenian, and the Lettish peasant against his German landlord, he scarcely foresaw how soon these weapons would be turned against the throne. Anti-Semitism among the lower classes may long continue, but Jew-baiting from above must slacken, when the ruling classes recognize that it means playing with fire.

THE MONTAGNINI LETTERS.

Apparently, they do *not* order their lying better in France. The publication of the Montagnini letters to the Vatican has led to a perfect deluge of passionate *démentis*. It reminds one of that passage in the Mémoires of Saint Simon where he speaks of his father's indignation at being slandered in a book of La Rochefoucauld's:

> My father felt so acutely the atrocity of the calumny that he seized a pen and wrote on the margin, *L'auteur a menti*. Then he went to the book store and made the same marginal note in every copy.

On March 30, the *Figaro* began printing an analysis of the 1,300 letters in the Montagnini *dossier*. They reflected gravely upon many men prominent in public life, as also upon highly placed ecclesiastics. Instantly, they all with one consent began to denounce and repudiate the statements of the former Papal Nuncio in Paris. Premier Clemenceau came out with the roundest denial of all that related to him. Ex-Minister Berteaux hastened to declare Montagnini's references to himself totally unfounded, and added:

> It is not strange that the Pope, with this sort of information, became the best collaborator of those who, like me, desired the separation of Church and state.

M. Barthou, Minister of Public Works, arraigned Montagnini as a slanderer in his case, too. So it went on. Even Catholics cried out upon the late Nuncio. M. Piou, the Parliamentary leader of the Church party, had to admit that many of Montagnini's assertions were "inexact," while the venerable Archbishop of Besançon, Monsignor Fulbert-Petit, flatly said: "All the imputations against me are calumnies." The Bishop of Tarentaise came out with a letter in which he said that Montagnini had evidently got his information, "not from real bishops, as he alleged, but from lamplighters and charwomen." Finally, a dispatch from Rome stated that letters were pouring in from France, written by "bishops, priests, laymen, great ladies," and all complaining bitterly of the way in which Montagnini had swallowed all the gossip and rumor brought to him. Yet it was largely upon the information and advice furnished by this credulous and careless agent that the Vatican founded its policy in a momentous question!

Montagnini's reports on French politics were certainly as inept as upon the attitude of the French Catholic press and the bishops. In 1906, he reported that the Government would lose forty seats in the elections; it gained more than that number. He predicted that the Separation bill would not pass the Senate; it did so easily. The most unhappy impression made by the letters is that of constant meddling in French politics by the Vatican. We have already referred to the damaging note addressed to the Archbishop of Lyons by the Papal Secretary of State, Cardinal Merry del Val. There is other matter as bad. In 1904, it was said by Montagnini: "When the moment arrives, the campaign will be resumed against Pelletan and Delcassé." In 1905, when local elections were taking place, Merry del Val wrote of the good political effects of religious persecution, which he hoped might be extended, yet he warned Montagnini to burn his letter lest the intervening of the Vatican in French politics should become known! And to this agent who is now shown to have been so incompetent and misleading, the Papal Secretary wrote, praising him for his zeal and prudence, adding, "Try to listen well, to report everything, and to talk little." It is evident that the Holy See was badly served; and the rumors that Merry del Val is to retire would seem to be warranted by what has been made public about his activities, in these Montagnini papers.

Doubtless, there are more of them to come. They were seized by the Government, at the time of the breaking off of diplomatic relations between the Vatican and France, and the expulsion of the Nuncio. The documents have been under official investigation. Nearly all the letters already published were obtained from Rome; and Premier Clemenceau, in his letters to the *Figaro*, has distinctly asserted that they were garbled, in the hope of breaking the force of the *coup inévitable* which will result when the whole are officially printed. "No one will lose anything," he added significantly, "by waiting a couple of weeks." But, even as they stand, the revelations have caused a tremendous reverberation in France. They fully confirm, what has been plainly intimated before, that the majority of the French bishops desired to accept loyally the Separation law; and show in the most painful way upon what misinformation about actual conditions the Vatican was led to act.

THE WHITELEY CASE AND THE DEATH PENALTY.

The commutation of the death sentence in the case of Horace G. Rayner to imprisonment for life has created but little less of a sensation in England than his murder of William Whiteley. Opinion is strongly divided. The *Spectator*, for instance, feels that the Home Secretary, Mr. Gladstone, acted "with insufficient reason," and that the only grounds "for respiting Rayner were sentimental, which are not only not valid reasons, but highly dangerous." On the other hand, the Liberal *Tribune* rejoices that mercy was shown, "in harmony with the spirit of Easter," and suggests that the time has now come when the general question of capital punishment should be reviewed. To this the *Spectator* replies that the commutation of the prisoner's sentence "amounts almost to an abolition" of that punishment.

Reasons of sentiment undoubtedly actuated most of the half-million persons who signed a petition for a reprieve and forwarded it to Mr. Gladstone. The story of the crime is not without its pathos. The very circumstances of Rayner's birth, if there is anything in heredity, predetermined him to a tragic ending. Drink, poverty, starvation, and the distress of mind that comes with seeing wife and child without food did the rest. That the crime was deliberate was beyond doubt; Rayner tried to blackmail Mr. Whiteley, and failing, threatened to kill himself on the spot. When Mr. Whiteley sent for the police, Rayner killed him and attempted to end his own miserable existence. That he was nursed back to health for the purpose of being hanged was to many of those who protested against his execution an especial aggravation. Finally, there were other pathetic family reasons which appealed strongly to the public. The attempt to make Rayner out insane failed when the two experts were compelled to answer a point-blank question as to whether they considered Rayner crazy. The answer "no" ended their testimony; there were no long technical squabbles, and no hypothetical questions of 13,000 words. It is obvious, therefore, that the sentimentality against which the *Spectator* protests was in no wise due to a public belief that the prisoner was mentally incapacitated.

Of course, if capital punishment is to be abolished, the grounds should be general and not special. Ethical reasons should prevail; "Thou shalt not kill" should be held to apply to states as well as to individuals. Yet, it is just such individual cases as Rayner's which seem to increase the growing feeling against the death penalty. Gen. N. M. Curtis, one of our foremost American opponents of executions, has recently told how he became a convert to the belief that the state should not kill any of its criminals. It was when serving as an officer of the Army of the Potomac that he was horrified by being paraded with his company to watch the hanging of a deserter. Yet he was himself engaged in killing some of his countrymen, and was by no means so moved when he saw whole regiments mowed down as he was by the execution of that one misguided youth. Similarly, the execution of Mrs. Rogers in Vermont a year or so ago, for the murder of her husband, caused many to apply, for the first time, the term "barbarous" to the whole proceeding. Here, too, was a criminal who had been much sinned against, yet about whose guilt there could be no doubt. Her sex added to the feeling of indignation in many hearts when the Governor brave-

ly announced that consistently with his duty, he could not commute her sentence. The thought that many an insignificant man whose case is quite as moving as Rayner's goes to his death almost unnoticed, because there is no special feature to attract attention of the press, is also unsettling some persons, if we may judge by letters to the English newspapers.

But the great mass of men do not as yet share Montesquieu's view that "in countries remarkable for the lenity of their laws the spirit of the inhabitants is as much affected by the slight penalties as in other countries by severer punishments." When Sir Samuel Romilly sought to abolish the penalty of death for the theft of five shillings' worth of goods from a shop, Lord Eldon declared that, if this bill passed, "then may your Lordships expect to see the whole frame of our common law invaded and broken in upon." Many humanely disposed persons are moved to apply similar language to the proposal to do away with the death penalty; and the passage, subsequent to the death of McKinley, of a statute making it a capital crime to attempt the life of a high Federal official is proof that reactions are still possible in times of popular excitement.

The question may therefore be asked, particularly in view of the Rayner case, whether the abolition of the death penalty is not likely to come quite as rapidly by way of executive remission of sentence as by direct agitation. The experience of Kansas would seem to confirm this theory. There the jails have for years past contained murderers condemned to death, but living on, because no Governor could bring himself to sign their death warrants. At the last session of the Kansas Legislature this anomaly was ended by the formal abolition of the death penalty. This step evoked no protest whatever from the general public, which was doubtless aware that those American States which have for many years abolished the death penalty have not as a result suffered from more crimes of violence.

There are still murders and executions enough in England to make it unlikely that the story of Kansas will repeat itself there; yet the yielding of the Home Secretary in the Rayner case will for a long time to come furnish ammunition to those who believe that, as has been the case for generations, the law must be made to grow more humane and more lenient. The strongest argument of those who advocate a milder punishment is that death is irrevocable. It gives the guilty man no opportunity to reform, and allows no one to aid him in developing his better side —that residuum of goodness and virtue to he found in every human breast. And if any error is committed—there are many such cases on record—it is impossible to right the wrong either to the victim or to his family.

SANITY IN LITERATURE.

The first Leslie Stephen Lecture, delivered last February at Cambridge University, and now issued by the Clarendon Press in a shilling pamphlet, is an utterance which we commend to the attention of rising authors. The lecturer, Prof. Walter Raleigh, took as his subject Samuel Johnson. He could not have made a happier choice; for Johnson was a central figure in that eighteenth century life concerning which Leslie Stephen himself wrote so much and so sympathetically; and, more than that, Stephen prepared two admirable biographies of Johnson, one in the English Men of Letters Series and the other in the "Dictionary of National Biography." Professor Raleigh emphasized that side of Johnson's character which Stephen particularly admired—a side, we may add, which Johnsen and Stephen had in common—sanity. For Johnson, in spite of certain whimsicalities and prejudices, was chiefly distinguished for what Stephen calls "massive common-sense."

Turning from the Johnson whom Boswell paints in such vivid and enduring colors, Professor Raleigh considers the Johnson who reveals himself in his own works, the Johnson of the *Rambler* and the "Lives of the Poets." Taine complained that Johnson's "truths are too true, we already know his precepts by heart"; that Johnson's writings are nothing more than a treasury of commonplaces. Professor Raleigh, however, maintains that Johnson had not, as Taine implies, a commonplace mind, but that he is undervalued because he presented the "odd spectacle of a journalist who cared passionately for truth, and nothing at all for novelty." He made no effort to surprise or startle his readers; he indulged but sparingly in the cheap luxury of paradox, because he "knew that what he had to say was no commonplace, so far as he himself was concerned. Among all his discourses on human life he utters hardly a single precept which had not been brought home to him by living experience."

But human experience is an old story. We invent new machinery of life. Hoopskirts disappear; hats and houses change from day to day; but the hearts of men and women are much the same as in the time of Homer or Job. This is why a great work of literature, a real criticism of life, though the product of an alien tongue and a distant age, is always, in its essentials, contemporary. The task of the philosopher, the novelist, and the poet of this twentieth century is not to discover new truths; for, speaking broadly, there are none. He is simply to give the everlasting verities a different guise from that of a generation ago: a few fresh words and phrases, the background of the modern world, and the work is done. Creative genius, after all, does nothing but offer us the old clay of humanity in a slightly different mould. The lines which impart an aspect of strangeness are, when examined closely, seen to be wholly superficial—merely a rearrangement of the drapery. Robinson Crusoe is Ulysses three thousand years later; Shakespeare's Romans are only Plutarch's, talking Elizabethan English.

Thus it is that the books which are freakish and morbid, aberrations from the great norm, sooner or later fall into oblivion. The brimming stream of sane and wholesome life moves on, "out of the mist and hum of that low land," overwhelming the little books which have had their success of impudence or nastiness. We do not deny, of course, that the very qualities which render a book ephemeral may make for quick notoriety and large sales. If any man—or, better still, woman—of fair ability as a writer, will put forth a book advocating polygamy or free love, the volume will be sure of wide notice in the sensational press; and every one who is ambitious to know about "the latest thing in literature" will buy or borrow a copy. A novel that barely escapes suppression under the law against obscene publications will command the suffrages of those callow youths of all ages who pose as "advanced" or "emancipated" thinkers. Any book, in fine, which is based upon the shallow theory that our conventions, customs, and laws are simply artificial and transient affairs, not the crystallized experience of millions of men through thousands of years —any such silly outgiving is foreordained to immediate popularity and ultimate oblivion.

We should not, therefore, be profoundly disturbed by the rubbish, erotic or neurotic, which is the fashion of the moment. A worthy English prelate, the Bishop of Norwich, asserts that books now read in the best English families are so immoral that they could not have been printed a few years ago. He adds that out of eighty novels recently published seventeen show that marriage is an antiquated institution, eleven set up marital infidelity as the spiritual ideal, and twenty-three are so vulgar in wording that they should not be placed on sale. The vogue of such writing, we admit, is an evidence of thoughtlessness, perhaps viciousness, in a class of society from which we might expect better things. But pornographic books have always had too large a circulation; though in the past the number of people who fed on such filth was probably larger, in proportion to the total number of readers, than it is in 1907. We must not forget that the recent enormous increase in the output of our presses and in the reading public tends

to distort our view. In 1807, out of a total of less than eighty novels, there were probably twenty-three quite as nauseating as any now current; and in 1707, Jeremy Collier was still crusading against the dirty drama of the Restoration. But Wycherley's "Country Wife" is as dead and buried as the novels of Aphra Behn; and not one reader in ten thousand has ever heard of Lewis's "Monk," which was the target of the moralists of 1795. On the other hand, the novels of Scott survive in perennial vigor. As it has been, it is now, and ever shall be. The minds and souls of men in the mass remain sound; and inevitably they will reject the work of authors who are bent on attracting attention at any price, whether it be by wearing cap and bells or wallowing in the mire.

THE POWER OF THE DRAMA.

The Paris *Temps* contains an apparently authentic account of a literary experiment carried out recently in a village in Russia. To an assemblage of typical *mujiks*, there were read in succession "King Lear," "Hamlet," and "Othello," and all three plays succeeded in moving the peasant audience to heights of emotional transport and pleasure which their distinguished compatriot, Count Tolstoy, has lately declared himself quite incapable of attaining. With the story of "King Lear" there was no difficulty at all. The old king's senile arbitrariness and peevishness were instantly comprehended and condemned, though later his due meed of pity was not refused him. The wicked sisters were properly execrated, and Cordelia won many tears throughout the play. "Othello" was somewhat of a puzzle at the beginning, but soon seized the audience and held it to the last pitiful moment, which to many came unexpectedly. "Hamlet" was the most difficult of the three plays; the famous soliloquy had to be twice repeated before its meaning was clearly grasped, and Ophelia's conduct gave rise to varying speculations. But it is nothing less than amazing that the humble Russian audience should have hit upon the very mooted point that more intelligent Shakespearean audiences have so long debated, and immediately fallen to arguing whether Hamlet's irresolute conduct proceeded from inherent defects of character or the irresistible force of circumstances.

The incident, if true, is a good deal of a joke, both on the sage of Yasnaya Polyana and the bard of Avon. Here is Tolstoy girding at Lear's extravagances and vulgarities, denying the play the rank of high art; and yet his position is emphatically condemned by that very peasant audience whose naïve judgment he makes the standard of all æsthetic value in his "What is Art?" Would the peasants have better appreciated, let us say, Racine's "Agamemnon" or Lessing's "Nathan," because the protagonists did not go into fits of vulgar anger and address their enemies in a mixture of Isaiah and Billingsgate? We doubt it. The elemental turgidity of the play was too much like what, in coarser form, they may have very well known and experienced in person; for we may say that the manners of British royalty in the sixth century, B. C., were not very different from those of the Russian tiller of the soil to-day. And so history has its little game of irony with Shakespeare, who must appeal for justice from Prospero Tolstoy and Mercutio Bernard Shaw to an audience of his own clowns, to Touchstone and Bottom and Dogberry and, possibly, Lear's Fool.

It would be interesting to know just what process of change the Shakespearean plays were put through before they were given to the Russian peasant public. There must have been much simplification. The very translation of "Hamlet" into a foreign tongue is a step towards verbal simplicity; "there's the rub" becomes "voilà l'obstacle," and a "bare bodkin" cuts like a "petit couteau." And once you remove the occasional obscurity or ambiguity that arises from figurative style or complicated sentence structure, why should not "Hamlet" seize immediately on an uneducated bucolic audience? To appreciate the merits of the play as an acting drama, as a "thriller," one should see it on the Bowery, interpreted by a poverty-stricken Italian company, with the very rags of costume and débris of scenery. What a splendid melodrama it stood forth as scene followed scene, and laid its grip on an American audience, ignorant of Italian, by sheer force of dynamic situation and tableau! It may be a grievous thing indeed to speak of "Hamlet" as stripped of its poetry and its rhetorical splendor; but stripped is not the word; most of the play remained there, strangely enough, in the threadbare Italian, just as it must have remained in the colloquial Russian, showing conclusively that, after all, the play is the thing with which to move the conscience of peasants no less than of kings.

And is not this efficacy of the drama before a popular tribunal coming to be more generally recognized every day? We are accustomed to say that once upon a time, under the Elizabethans, the play was the unversal literary form, and that in time it was replaced by the novel. Surely, at this moment the play is struggling to regain its early supremacy. The novel of purpose seems to have had its day. Authors now prefer to preach from the stage. Is it all due to the influence of Ibsen? Possibly. But the fact remains that the world's best-known contemporary writers are the dramatists or novelists attempting the drama. Since the death of Zola, the theatre in France has had things almost all its own way, with Rostand, Donnay, Brieux, Capus, Lavedan, Mirbeau, Battaille, Fabre, and others. Contemporary German literature to the man in the street means Sudermann and Hauptmann, with an occasional novel of military scandal. Italy is just the Annunzio of the Duse plays. The reformer or the rebel instinctively turns to the stage, whether he be Gorky in "The Abyss," or Galdós in "Electra," or Shaw in everything.

Is this drift to the drama due to the higher rewards which the theatre is said to offer? Hardly; the field as compared with that of the novel is so narrow, and the chances of success are so correspondingly small, that, to the average writer, dramatic authorship should be the least tempting of all callings. But it is rather in the nature of the serious task dramatists set themselves that the cause probably lies. A novel with a purpose is well enough, but, after all, the man who wants to preach usually tries to gather a crowd. Your novel reader cannot be counted upon. He is alone in his easy chair, or in a railway car, or on some rural veranda, and who knows what mood of the moment may shape or destroy the potency of your appeal? Your theatregoer comes attuned more or less to the message that is to be conveyed. But, more than that, he presents there in company with a thousand others a much more powerful emotional medium than he would be by himself; and all of us would rather sway a symphonic orchestra than play a mere fiddle.

KEEPING ART IN ITALY.

The manœuvres of the Italian authorities and the private owners of works of art resemble a game in which it is agreed that the Government shall lose. No sooner have most of the Cattaneo Van Dycks disappeared from Genoa than the alarm changes to Ferrara, where a notable collection is under siege from Paris, the bribe being extraordinary; for the pictures are not. Then Pistoia, resentful at the loss of a handful of good pictures and a chimney-piece, decides to establish a museum to keep the dealers at bay. It should be noted that every movement of aroused civic pride is just a shade too late. For fifty years it may be said that there has been but one striking exception to the rule of shutting the stable door after the theft of the horse. The Casino Borghese, with its invaluable contents, was saved for the nation, by purchase, in the face of impending loss.

Under the new law, as under the old, the traffic has gone on apace. The statute requires that every important object should be entered in the Government inventory, and, when sold for ex-

portation, submitted to the Central Commission of Fine Arts. As a matter of fact, this inventorying goes ahead lamely, for the excellent reason that the art treasures of Italy are ill-explored, even by the constituted authorities; whereas owners are, for obvious reasons, slow in seeking the honor of registration. The Cattaneo Van Dycks, for example, were never registered, and it is doubtful if the Government has legal recourse against the vendors. Private owners who thus evade the requirements of the law are subject either to the absolute veto of a favorable sale, or to what amounts to expropriation at a price far below the market. An American critic purchased a fragment of a Grecian frieze at 2,500 francs for a college museum. The piece was duly presented for appraisal and payment of the export duty. The Commission promptly offered half the price in behalf of a Roman museum. Without especial luck or influence, the college may be forced to choose between sale at a loss or keeping its marble indefinitely in Italy. But to do the new law justice, it does bring under the eye of the Government experts a number of objects of art which are thus purchased for the national collections on very favorable terms; but the practice has an undignified savor of confiscation, and practically only things of minor interest are thus retrieved—objects like a couple of Bellottos recently ceded to the Uffizi, the loss of which to Italy could hardly be regarded as serious. So far as the fact of the inventory discourages churches, hospitals, and similar public institutions from peddling off the remnant of their original artistic heritage, it is wholly good. No lover of Italy would willingly see its public display of art diminished. The real offence is to move pictures or sculpture from the places for which they are made. What becomes of many of them, once they have been moved, seems to us, in spite of the panic prevailing in Italy, rather a matter of indifference.

There is, in fact, an enormous and sentimental exaggeration of the importance of the vendible objects of art in Italy. Everything that could conceivably be sold might be shipped across the Alps to-morrow, yet to the average person of taste Italy would remain unchanged. The churches and public galleries are so enormously rich, the private collections relatively so little visited, that a wholesale exportation would scarcely alter the look of things. Indeed, so far as the tourist is concerned, the dear soul would never know the difference were all the private collections of Genoa, Milan, and Venice sold *en bloc*. The alarm when a chimney-piece or a minor picture is exported smacks of the pedantic. It bespeaks the antiquarianism that has ever crippled Italian criticism, rather than a truly discriminating love of art. It would be easy to show that even in the most deplored instances of sale abroad, Italy has suffered no substantial harm. The possession of the Chigi Botticelli, for example, is immensely important to us; its loss can hardly be considered grave to Italy in view of the roomful of Botticellis in the Uffizi. Even the Inghirami of Raphael, which passed from Volterra to the same Boston collection, should not be unduly mourned, since the Pitti contains a superb replica of that masterpiece. Generally speaking, Italy has lost only that in which she was immensely rich. One may heartily applaud the attempt to keep Van Dyck, in which the museums are rather poor, in the country; one may wish all success to the campaign against the dissipation of the riches of churches and other institutions; but the movement is late—the harm was done fifty and more years ago.

Guido Cagnola, the learned editor of the *Rassegna d'Arte*, suggests a reform in the administration of fine arts—to wit, a concentration of effort upon objects that are truly, in the words of the law, "of highest value" (*di sommo pregio*). Let the central authority make a minimum list of objects with which the museums cannot rightly dispense—not troubling about the rest—and then let the Government, like any honest buyer, take the refusal of such objects at a fair price. Such ordinary square dealing would make the present evasions superfluous, while the simplification of its task would make the activities of the new Central Commission of Fine Arts more dignified and useful. A minimum of interference with private property, and an honest allowance in case of expropriation, would seem to be the golden rule of the game of keeping art in any country.

We fancy that the panic, which has prevailed not only in Italy, but in England and Germany, will subside when it is perceived that there is a natural law of flux and reflux in these matters. One hears much of the American peril, but fine pictures are already being bought back from us for Europe in considerable quantities. For years England was the most dreaded purchaser, but under the inexorable conditions of economic law she has given up many of her finest pictures to France, Germany, and America. In other words, the game is an international one, and to attempt to make it less so is only to try in vain to spoil sport. By the time that the wealthy and enlightened amateurs of Milan are capturing fine Italian paintings from London, Paris, and New York, we shall hear less about keeping art in Italy.

PRESENT NEEDS OF THE PUBLIC SCHOOLS.

In the present article I shall speak chiefly of the New York public schools, with which I am most familiar; but many of my arguments apply to the school systems of all our larger cities.

During the past ten years great advances have been made in public education in this city. The standard for entrance to the teaching profession has been considerably raised. Ten years ago the vast majority of the teachers had a preparation of only four years above the elementary schools—a preparation which did not usually include professional training. To-day all teachers must have had at least four years of academic and two years of professional training, or, in lieu of such training, must have had five years' successful experience in teaching, and must show by examination that they have had an education at least equivalent to that given in our high schools and training schools. Ten years ago it was difficult to obtain a position, except through political, social, or religious influence. To-day all appointments are made by competitive examination; so that political, social, and religious influence has been almost completely eliminated. There has been a corresponding improvement in the work of the elementary schools. The course of study is in line with the best scientific educational thought; the teachers, as a rule, show zeal and intelligence. Ten years ago there were no high schools in the former city of New York. During this period not only has the high school system of the boroughs of Manhattan and the Bronx been developed, but the high schools of Greater New York have been placed upon a basis which commands the respect of the people, and the admiration of educators throughout the world. Our high schools not only prepare for the best colleges, universities, and professional schools, but they are also preparing through specialized schools—commercial high schools, manual training high schools, and a technical high school for girls—in a most efficient way for some of the most useful productive activities. Ten years ago there were large waiting lists of pupils who could not obtain entrance. To-day all pupils of school age who apply are admitted; and, if the facilities do not allow full time for all, part-time is given. By part-time is meant instruction for three and one-half hours per day, instead of the standard day of five hours. During the current year considerably over 600,000 children will have received instruction, only about ten per cent. on part-time. Improvements in buildings have fully kept pace with other improvements. Our buildings, both in exterior beauty and in interior arrangement, are regarded as models.

These are some of the more important reforms of the past decade. While those of us who are engaged in the work may regard them with pardonable pride, we must not lose sight of the fact that many things are still wanting to make our system worthy of this great city, and able to meet all the demands of our rapidly increasing and heterogeneous population. Among the more pressing needs are the following:

I.—SMALLER CLASSES IN ELEMENTARY SCHOOLS.

At present the average number of pupils to a teacher in the elementary schools is about forty-three. Unfortunately, this average, as is generally the case with averages, is deceptive. In many outlying parts of the city, where population is sparse, the classes are small. In more densely populated sections, such as the lower East Side of Manhattan and the Brownsville district in Brooklyn, classes are very large. Some teachers have charge of fifty or even sixty pupils, and there are cases where we find sixty-five. Bad as is this state of affairs, it is a great improvement over conditions within my own recollection. I have seen the time, in Brooklyn, when there were hundreds of classes with over seventy pupils, and when even one hundred was not uncommon. While these extraordinary registers have passed away, I trust forever, the health and happiness of thousands of children are menaced in classes that have even fifty pupils. There are only 1,500 minutes in the school week. If we deduct 300 for opening exercises, recesses, and physical training, we have only 1,200 remaining for instruction. In a class of fifty, therefore, each pupil may speak or read separately for only twenty-four minutes a week, or less than five a day. It is obvious that under such conditions work cannot be thorough. One of our crying needs is for more individual instruction. In a very large class such instruction is out of the question. The reduction of all classes, so that no teacher shall have more than forty pupils—even that is not ideal—I place foremost among imperative reforms. To effect this change an expenditure of $1,500,000 per annum, for salaries of teachers at present rates, to say nothing of the cost of the new buildings for additional classrooms, would be required. When, however, we consider that a large proportion of our pupils are born abroad and cannot speak English when they enter upon school work, that the great majority of children must go to work at fourteen, and that their health, happiness, and economic value due to better education would be vastly improved, the reform would seem cheap at the price.

II.—CHANGES IN THE COMPULSORY EDUCATION LAW.

The reduction of the number of pupils to a teacher naturally brings me to consider the compulsory education law. This law, which was enacted in practically its present form about twelve years ago, now seems defective in several respects:

(1.) While it provides for the punishment of parents who do not send their children to school, it lays the penalty chiefly upon the child. The law recently adopted in Illinois follows the more reasonable plan of holding parents and guardians to a strict accountability. The difference between the effect of the New York compulsory education law and that of Illinois is shown by the number of parents fined or imprisoned during the past year. In New York the number fined was 39; imprisoned, 4. In Chicago, the number fined was 532; imprisoned, 59. It has been said that so few parents are punished in New York because police magistrates do not sympathize with the objects of the law, and, some would venture to say, fear to offend possible voters. For instance, the number of parents arrested in New York at the instance of truant officers was last year 262, while only 43 were punished. Doubtless, the assertion contains some truth. I believe, however, that the trouble lies not so much with the magistrates as with the law.

(2.) The compulsory school age is now from eight to fourteen for all children, and from fourteen to sixteen in the case of children not engaged in legal employment. I believe it would be greatly to the advantage of this community, and indeed of all communities, if the legal age were reduced to seven. Even the most zealous advocate of delayed school instruction will admit that a child's brain and body are sufficiently developed at seven to endure the strain. The recent school census shows that of children between seven and eight about 19,000 are not attending school; of children between six and seven, 33,000; between five and six, 50,000. Under our local regulations children under six, if admitted at all, must be placed in a kindergarten. It would probably not be wise to attempt to force all children between six and seven to attend school. There can be no question, however, of the wisdom of requiring children between seven and eight to attend. A year of school instruction at this critical period may mean the difference between success and failure in after life.

III.—HIGH-SCHOOL ADMINISTRATION.

The great weakness of the public high schools is that so many students leave before graduation, particularly during the first year. For this exodus many causes are assigned. The hard necessity of earning money is undoubtedly the controlling motive with a majority. There are many others, however, to whom this reason does not apply. Some have not ability to cope with high-school studies, and naturally fall by the way. Others are bewildered for a time and too often demoralized by an atmosphere very different from that of the elementary school. In the elementary school the teacher stands close to the pupil and helps him over most of his difficulties; in the high school the teacher stands more aloof and throws the pupil more on his own resources. The latter finds the required home study exceedingly heavy. Too often, particularly in the case of the children from tenement houses, of whom we have vast numbers in our high schools, there is no spot at home for uninterrupted study. The kitchen, which is at once the dining room and living room of a large family, is the only place. Hence many such children soon become disheartened and leave. For the sake of these children I have recommended to the Board of Education that the high-school buildings should be kept open in the afternoon, and that pupils should be permitted to remain to study. Teachers of special ability should be assigned to the task of supervision and assistance. In support of this recommendation I have used the following argument:

The advantages of this plan are manifold. It will utilize the school buildings more fully than at present. It will secure to each pupil favorable conditions for study. It will enable him to obtain needed advice and assistance from those best able to give advice and assistance—his teachers. It will afford the teachers an opportunity, through private conference, to obtain an insight into the character of their pupils which they could not gain in any other way, and so will react favorably on the work of the classroom, and, lastly, it may be put into operation at a very slight cost.

Yet with all these possible advantages, there is still the great difficulty: our highly specialized schools—commercial schools and manual training schools—are not used to the best advantage. Pupils who have no natural aptitude for mechanics often go to manual training high schools, and pupils who have no natural ability in literary or scientific directions take the literary and scientific courses. The children themselves who are between fourteen and fifteen when they enter high school are, it need not be said, quite unfit to make a rational choice. In such a matter parents are often as helpless as their children. To whom, then, can these children turn for guidance in a step which has such important and far-reaching consequences? We must, I believe, call upon principals and teachers in elementary schools to assume a large share of this responsibility. The elementary course is now so arranged as to develop whatever natural talents a boy may possess. If he has shown special ingenuity in the use of tools in the shop-work class in the elementary school, he should be encouraged to go to the manual training high school. If he has evinced ability in literature he should be advised to take the regular high school course, and so on. Probably no economic waste is so great as that involved in setting people to do work for which they are not fitted. It is time, then, that the elementary teachers and supervisors took up this burden of directing their pupils.

IV.—MORE WORKSHOPS, KITCHENS, AND KINDERGARTENS.

I have said that the course of study in the elementary schools is now so arranged as to develop whatever talents a boy or girl may possess. Theoretically there are kindergartens for children under the age of six, in which a child's self-activity is directed in appropriate channels. For girls there are sewing and cooking; for boys there is workshop practice in the use of wood-working tools, and in the making of useful and ornamental articles. Unfortunately, however, not nearly all the elementary schools are provided with these equipments. They are to be found in all newer buildings, but in many older buildings they are still conspicuous by their absence. We have 549 kindergartens, but 109 schools containing children of the first-year grade are still unprovided with kindergartens; 113 grammar schools for girls have no cooking rooms, and 118 grammar schools for boys, no workshops. Obviously, then, one of the great needs is that all schools should have this equipment at the earliest possible moment. It is essential not only for the proper education of eye and hand, as well as of mind, but also for disclosure of the child's nature to himself and to his teachers. It is only when a child's talents have been discovered through the work of the elementary schools that he can make an intelligent choice of his work in the high school or that his teachers can give him sound advice.

V.—SCHOOLS FOR DEFECTIVE CHILDREN.

For some years past the Board of Education has been establishing classes for children who are mentally defective. Re-

cently this undertaking has been reorganized, and is now proceeding along lines which will, we trust, render it highly efficient. The effort, however, to provide for children who are physically defective is still only in its infancy. We have taken over two small schools for cripples, and supplied teachers, to the great advantage of the children in these schools; and we have organized one class for cripples in a public school building. A project is now under consideration to establish a school for the deaf and dumb. We also hope at an early date to organize a school for the blind. The parents of physically afflicted children are placed in a most unfortunate position. For the training and instruction of such children there are schools in which large fees are charged. There are schools of a similar character which are purely charity organizations. The man of moderate means cannot afford to send a child to the former and he feels humiliated by sending him to the latter; and yet the child who lacks some of his physical powers has just as much right to an education as the child who has them all; indeed, he has an even better right, because through physical infirmity he has a smaller chance of making his way in the world and becoming self-supporting. It would seem, therefore, to be the duty of the public school authorities to make ample provision for children who are suffering from physical infirmities. Otherwise such children are denied the right secured to them by the State Constitution—the right to an education at the expense of the State.

VI.—PHYSICAL EXAMINATIONS.

Up to a comparatively recent date the Health Department of the city, in its examinations of school children, confined its energy to the detection of contagious disease, and to the temporary exclusion of pupils suffering from such disease. Except in Manhattan, the work of the Health Department in the schools is still so limited. When Dr. E. J. Lederle was commissioner of health a beginning was made in the examination of children in Manhattan to discover defects which retard physical development and intellectual progress. Under Dr. Thomas Darlington this work has been continued and extended. During the year 1906, 78,401 children were examined; and the following are some of the results:

No. of cases of bad nutrition	4,921
No. of cases of enlarged anterior glands	29,177
No. of cases of enlarged posterior glands	8,664
No. of cases of chorea	1,380
No. of cases of cardiac disease	1,096
No. of cases of pulmonary disease	757
No. of cases of skin disease	1,558
No. of cases of deformed spine	424
No. of cases of deformed chest	261
No. of cases of deformed extremities	550
No. of cases of defective vision	17,928
No. of children of defective hearing	869
No. of children of defective nasal breathing	11,314
No. of children of defective teeth	39,597
No. of children of deformed palate	831
No. of children of hypertrophied tonsils	18,306
No. of children of posterior nasal growths	9,438
No. of children of defective mentality	1,857

The total number found to require medical or surgical treatment was 56,259, out of 78,401 examined. The great majority requiring treatment were among those backward in studies, from one to five years behind the grade to which, on account of age, they would naturally belong. Experience has amply demonstrated that when a child is intractable or deficient, and is at the same time suffering from a removable physical cause, the removal of that cause almost immediately works a wonderful change, both in deportment and ability. If any way could be devised by which all children suffering from the maladies reported by the Health Department could have proper medical and surgical treatment, not only would such children be enormously benefited, but the present school facilities could be utilized to much better advantage. In all the tenement-house neighborhoods the schools are congested by children who are away beyond the normal age for their grades. Any plan that would advance these children more rapidly would add enormously to the seating capacity of our schools, and enable us to reduce the size of classes. I have recommended to the Board of Education two plans for at least partly relieving these bad conditions: (1) The establishment of lunch-rooms in which simple and nutritious food would be sold at cost price, because malnutrition is indubitably the original cause of most of the physical defects; (2) the furnishing of eye-glasses to children of defective vision. The latter suggestion is now under consideration by the Board of Education. It seems folly to supply books to children who cannot read them or to place children in classrooms when they cannot see what is written or drawn on the blackboard. If the sight is defective, the child is hopelessly handicapped. The expenditure of a few thousand dollars for glasses would enable thousands of children who are now unable to do their school work to stand on the same level with their fellows.

The argument is frequently advanced that the furnishing of eye-glasses and the provision of medical and surgical attendance should be left to parents. Unfortunately, however, only a small percentage of the parents whose children are suffering have taken the necessary action. For instance, fifty boys were recently examined in one of our truant schools; thirty-three were suffering from physical defects which were retarding their progress and were probably the cause of the restlessness that had led to truancy. In every instance the parents were requested to have the necessary operations performed, and were told of hospitals and dispensaries in which these operations could be performed without expense in case they could not afford to pay. In only one case was the advice taken. The other boys continue to suffer. They are being punished for truancy for which they are not morally responsible; they are prevented from using the advantages which the city provides. Their usefulness in after life will be seriously impaired; in all probability many of them will become criminals; and yet it is reasonably certain that a slight surgical operation would change their whole course of life and set them on the high road to health and happiness. De Quincey in his incomparable autobiographical sketches, shows how a brutal beating inflicted upon his gifted brother at school drove him forth a wanderer on the face of the earth: and how he himself, through lack of a dose of calomel at a critical moment, was estranged from his family, and so weakened in his will power that he became the most renowned of all the victims of opium. So small a thing may affect in childhood the life of a human body and soul.

I have stated that the examinations for physical defects made by the Department of Health are conducted only in Manhattan. That Department has not yet found means to conduct similar examinations in the Bronx, Brooklyn, Queens, and Richmond. Enough has been done, however, to show that such examinations should be made regularly and thoroughly, and that some means should be adopted to cure the defects discovered. I raise the question whether the examination for physical defects, as distinguished from the examination for contagious disease, should not be placed under control of the Board of Education with sufficient funds to make the work general and effective.

VII.—MORE MONEY.

All of the projects described above will require considerable money. A bill now before the Legislature provides that over $6,000,000 per annum, in addition to what is already paid the teachers, shall be devoted solely to increasing their salaries. I have always stood for liberal pay for teachers. I believe that the time has come when the salaries should be raised. If, however, this mandatory legislation is passed, it will inevitably mean that money for necessary improvements and necessary equipment will not be forthcoming, because the budget for salaries will be so large. The interests of the children demand that not all of the possible increase shall go into the pockets of the teachers.

WILLIAM H. MAXWELL.

NEWS FOR BIBLIOPHILES.

The first printed account of the settlement on James River, made in April, 1607, the three hundredth anniversary of which is now being celebrated, was a thin quarto by John Smith, "A True Relation of such occurrences and accidents of noate as hath hapned in Virginia," London, 1608. It was probably a letter, as it begins "Kinde Sir," but to whom it was addressed is not now known. It gives an account of affairs in the colony from the first landing, April 26, 1607, to June 2, 1608. It was entered at Stationers Hall on August 13, 1608, by "John Tappe, printer and William Welby bookseller at the sign of the Greyhound, in Paules Churchyard." It is a book of great rarity; and among the few copies known there are no less than four varieties. These do not represent four distinct editions, but show only that the title-page was four times printed. The one which seems to be the earliest issue states that the "Relation" was "Written by a Gentleman of the said Collony"; the second issue was "Written by Thos. Watson, Gent."; the third was "Written by Captaine Smith one of the said Collony"; and the fourth was "Written by Captaine Smith Coronell of the said Collony." Some copies have two pages of preface lacking in others. This preface "To the Courteous Reader" is signed "I. H.," probably the editor's initials. In it he says:

> Some of the bookes were printed under the name of Thomas Watson, by whose occasion I know not unlesse it were the over rashnesse, or mistaking of the workmen, but since having learned that the saide discourse was written by Captaine Smith, who is one of the Counsell there in Virginia: I thought good to make the like Apollogie.

It therefore seems likely that the two earlier issues are perfect without the leaf of Preface, but that the two forms with Smith's name on the title-page, are imperfect without it. Twelve copies are known. The Lenox Library has three copies, the first, third, and fourth varieties; the British Museum, two, both with the Watson title; the New York Historical Society, two; the John Carter Brown Library, Harvard University, and the Boston Public Library, each one. The last mentioned brought $570 in the Barlow sale in 1890. The Deane copy, which brought $1,450 on March 31, 1898, is in a private library in New York, and presumably the Ouvry-Kalbfleisch-Lefferts copy is also in private hands.

Bertram Dobell, the London bookseller, has printed an interesting "Catalogue of Books Printed for Private Circulation." This class of books, the circulation of which is restricted to the friends of the authors, or to a limited number of subscribers, has not yet received much attention from bibliographers. The only important work in English, Martin's "Catalogue of Books Privately Printed," which includes, also, the publications of literary societies, was first issued in 1834, a second edition appearing twenty years later. Such books are, as a class, extremely difficult to trace, or to assemble. Mr. Dobell's list includes only books which he has owned himself during the last twenty years. He lists numerous books printed before 1854, which were unknown to Martin, but the major part of his two thousand or more titles are books printed since the last edition of Martin. Besides the title and collation, there is for almost every item an interesting note, telling something of the book and its contents. Although Mr. Dobell at one time owned those two little plays for which Thackeray furnished the illustrations, "King Glumpus," 1837, and "The Exquisites," 1839, they are not included; nor does he mention any of the privately printed Tennyson booklets, the most important of which was "The Lover's Tale," 1832. Mrs. Browning's first publication, "The Battle of Marathon," of which fifty copies were printed in 1820 by her father, is another rare volume, which might have been included. The only American book which we have noticed (although there may be a few others) is Henry M. Field's "History of the Atlantic Telegraph, to the Return of the Expedition of 1865," New York, 1866, an edition which is not mentioned by Sabin. The first American privately printed book is by John Eliot, the translator of the Bible into Indian, Cambridge, Marmaduke Johnson, 1665. It is a small sixteenmo of thirty-eight pages, with a title, too long to transcribe in full: "Communion of Churches by the Ordinance of Councils, Constituted in Order According to the Scriptures." Only three copies are known: One, uncut, with manuscript notes in the margins, supposed to be by Eliot himself, which brought $155 in the Menzies sale, November, 1876, is now in a private library in New York; Brinley's copy, which brought $110, March, 1879, is now in the Lenox Library; the third copy is in the Bodleian.

On April 29, the Merwin-Clayton Sales Company of this city offers a miscellaneous collection, containing an unusual lot of about one hundred and sixty volumes of American poetry, mostly by minor authors. An especially interesting volume is the copy of George W. Kendall's "Narrative of the Texan Santa Fé Expedition," which the author presented to Charles Lever, with the autograph inscription saying that he "had beguiled many hours of imprisonment" in a Mexican hospital "by perusing and reperusing 'Charles O'Malley.'" On May 1, 2, and 3, they sell a collection containing an extensive series of Lincolniana. A copy of W. D. Howells's first book, "Poems of Two Friends," Columbus, 1860, is included.

Correspondence.

ENTRANCE ENGLISH REQUIREMENTS.

To the Editor of The Nation:

Sir: From one source and another much adverse criticism has been directed against the syllabus in English of the College Entrance Examination Board and against the papers set upon this syllabus. Particular fault has been found with the lists of books prescribed for reading and for study. That they please no one is to be expected. The discontent is due to the way in which these lists are made. To prepare them, delegates from our leading educational organizations meet every few years. Each delegate brings to the convention an ideal of his own. Those of a practical turn would like a college entrance requirement, the preparation for which would supply directly the immediate needs of students of the community which they represent. Hence the views of delegates from large cities offer a marked contrast to those of delegates from the country. Representatives from schools, most of the pupils of which pass after graduation into college, aim at a course such as will fit closely into that of the freshman year. Other teachers look for books affording a rich fund of general information. Others still wish books around which can be woven a history of the English language and literature. Others again desire lists offering the largest possible number of representative literary types. Then, too, one teacher prefers a small number of books, each worthy of close study; whereas another demands a larger number suitable only for discursive reading. Obviously, views so divergent can be combined in no one requirement. The result is—and under like circumstances always will be—a compromise that in its entirety pleases no one, and that fits with exactness the needs of no locality. Faulty as the present College Entrance Examination Board's lists may appear, they are, nevertheless, a fair patchwork of the opinions of teachers the country over.

The foregoing statements account for the absence from the lists of many books for which there may be a local demand, and for the inclusion of others against which sharp criticism has recently been directed. The absence of certain books should, however, embarrass no one; for the board urges teachers to introduce their classes to much literature entirely outside the minimum requirements for examination. As a matter of fact, such reading is largely carried on in our best secondary schools, not merely through the school library or public library, but as regular class work. In some institutions pupils read thirty books or more over and above those required.

As to a number of the books that have come in for strong condemnation, the criticism arises from an incomplete realization of the task facing the teacher of English. For example, the De Coverley Papers, in the *Spectator*, the "Vicar of Wakefield," the "Rape of the Lock," and Burke's "Speech on Conciliation" are censured as lacking in appeal to the primary emotions—as devoid of strength and vitality. Now, experience shows that under the guidance of able teachers, pupils do get from these books much of value. The worth of a book lies not alone in its immediate appeal, due to its richness in images, its absorbing and voluptuous qualities. While making no such claim upon the fugitive interests of the young, a book may yet commend itself to class use by reason of its important array of facts, its structure, its style, its eminence among books of a certain type, its noble lessons. In one way or another, each of the acknowledged masterpieces named above contributes its share to the mental and spiritual uplift of our pupils. Teachers of English are concerned not so much with catering to the present tastes of their pupils as with equipping them for their ultimate life needs. Only by means of literature of proved worth can an even partially successful struggle be waged against the prevailing taste for the evanescent, the flashy, and vulgar periodical and journalistic literature of the day. Thousands of boys and girls of our secondary schools have no opportunity to browse in a substantial "father's library." But a small percentage will ever receive further formal instruction. It is of these, not of the privileged few who will attend college, that the teacher must think. The comparatively few books read in school must, then, serve the pupil as standards for future guidance. Through contact with them, he must be enabled later in life, in some small way, to select for his reading what is good, to reject what is bad, and to form judgments about what he himself writes along serious lines. Moreover, from them he must derive his sole knowledge of many of the bare facts of life and of many of the basic elements of the civilization of England and of America.

A word remains to be said in reply to the objections raised against a certain type of question set by the College Entrance Examination Board. The charge is made that examinees cannot successfully cope with questions calling for a knowledge of character portrayal, because the ability to frame adequate answers is beyond the power of the trained adult. Therein critics err. It is entirely possible for any adult with a good modern high-school training to answer such questions after a fresh perusal of the book upon which the questions are set. In the second place, that sort of question is entirely proper. The distinguishing feature of many, if not of most, great novels and plays is portrayal of character. It is, therefore, an essential part of an English teacher's work, to study with his class the subject of character development. Not to do so, would be to ignore an author's initial purpose. If such be a proper phase of instruction, why should questions upon character be barred from the examination

paper? Behind the objections seems to lie the idea that an examination paper must present only topics upon which pupils can write in a facile and interesting manner. This would be a narrow ideal for an examination framed with regard to prevailing tendencies in this country. Unfortunate though it be, it is nevertheless a fact that the general character of work done in schools is determined largely by the examinations the pupils must ultimately face. Were the tests to demand only a bare acquaintance with the main features of the books, pupils would give little attention to work in English. With big classes, with inadequate facilities for meeting the needs of the individual, with a constantly increasing foreign element to instruct, with an intensified curriculum operating side by side with growing pressure to "pass up" as many pupils as possible, and with a multiplication of extra-scholastic forms of activity, the teacher of English has his hands full to get even mediocre results. This being so, it is difficult to see how under a uniform system of examinations a better kind of test can be devised.

As a new subject in the high-school curriculum, English instruction is still in the experimental stage. Whatever help can be given toward framing the ideal course of study and the ideal examination will be most welcome. In place of mere destructive criticism those who have so freely discussed the syllabus and examination papers of the College Entrance Examination Board are, therefore, urged to lend constructive aid (a) by opening up the whole question of the advisability of uniformity; or (b) by suggesting a uniform list of books to be acceptable to all; or (c) by suggesting a new type of examination paper, such as shall at once lend itself to easy, graceful writing, shall demand of pupils an all-around training, and shall preclude the evils of "cram" preparation.

Boys' High School, Brooklyn, April 10.

FREEDOM OF SPEECH IN THE SOUTH.

TO THE EDITOR OF THE NATION:

SIR: For some ten years now certain publicists of the South, supported by the best of Northern journals, and not a few Southern leaders of thought, have waged a ceaseless warfare for freedom of speech. Justification and apology for such work are hardly necessary when one remembers how many and what serious obstacles were, and still are, in the way. The South accustomed itself to denying this essential condition of democratic government during the days of slavery; and the presence of the negro among us even now reconciles many to this abnormal state of things. Younger Southerners, teachers especially, have recognized that the restoration of absolute freedom of speech and of the press is the first step toward the emancipation of our section from the trammels of a bygone age. The opening of college halls to men who represent opposing sides of important questions, the fair and frank discussion in college classes of even the "forbidden subject" of possible race amalgamation, and the publication of magazines and newspaper articles have been the forms of this work. E. Gardner Murphy of Alabama, the late Chancellor Hill of Georgia, Prof. Andrew Sledd of Florida, and Prof. John Spencer Bassett of North Carolina have been the leaders of this younger school of Southerners. They have done the South and the country a service which ought not soon to be forgotten, for whether the negro problem is any nearer a settlement or not, they have taught us to reason dispassionately about a subject which lies close to the heart of every intelligent and patriotic man.

A little more than ten years ago public schools for all were not popular in the older Southern States, such, for example, as Virginia and the Carolinas. Some twenty years ago a young man from Baltimore, fresh from the German universities, Edward E. Sheib by name, began in Louisiana an agitation for better public schools, and for the training of public teachers by professional pedagogists. He cauvassed the State county by county, and aroused an enthusiasm and zeal which spread to other States, and ere long touched the whole South. Masterly men like Drs. Alderman and McIver crystallized this zeal for improvement into permanent forms. The administration of the Peabody funds was all the while available, and everywhere used with such wisdom that it was not difficult for outside philantbropists to organize in the fulness of time the so-called Ogden movement. The colleges which had, as a rule, held aloof now mobilized their forces and contributed to the new cause speakers and leaders whose names are known throughout tbe land. Incalculable good has been done. Wealthy men have been induced to contribute to the necessary funds, and Southern schools and colleges have been put on a new footing; every educator of this great section of our common country faces the future with confidence. Universal education is now popular; compulsory school laws no longer produce hideous nightmares in the minds of country legislators. Thus a second barrier to our progress has been broken down.

The great democratic churches, the Methodist and the Baptist, have felt the force of these new teachings. Religious papers have ceased to demand a rigid adherence to outworn creeds; heresy hunting is no longer a popular occupation; men of the most liberal views on matters of creed now occupy the first pulpits of the South; witness the Rev. W. M. Vines of Norfolk, Va., and Dr. John E. White of Atlanta, Ga. At the last general meeting of the Southern Methodist Church in Birmingham the liberal movement within this powerful organization took form. A committee was appointed after a most encouraging debate to restate the beliefs of the Church in such a way as to bring its dogmas into harmony with the best thought of the age. The more conservative churches, the Episcopal and the Presbyterian, though taking no public stand, are not less profoundly responsive to the modern spirit. It is with increasing difficulty that a heretic can be brought to trial, though in outward form these, as well as the other great communions, are truly conservative, slow to put on the new raiment.

But while these strongholds of retrogression have been taken, others have been erected which cover just as dangerous and even more insidious attacks upon individual and community liberty. For more than forty years the South has welcomed the incoming capitalist. Realizing what a power she exerted on national affairs when four million slaves were but concentrated wealth, the South has since 1865 offered every possible inducement to capital from the East and from Europe. Monopolies of many kinds have been freely voted by unsuspecting Legislatures. The result is a newer and milder form of slavery. The beneficiaries of many concessions have wormed their way into the steering committees of the two great political parties. have found places on college boards of control, and now threaten both legislator and teacher who speak the truth about their doings. In Virginia the names of four railway counsellors of high rank appear on the roll of the executive committee of the Democratic party; in North Carolina the American Tobacco Company was able to name the delegates to the last Republican National Convention; and in order to break the hold of J. P. Morgan on Georgia the radical wing of the Democratic party felt constrained to appeal once again to the ever-present race hatred.

Thus while we go forward with one foot we are drawn backward with the other. College faculties and other groups of influential men speak freely enough on the race question and violate the terms of antiquated creeds but never a word of criticism, at least in the old South, against the new industrial slavery which is gradually taking the place of negro servitude. A college president of good standing recently said, "Well, people may say what they choose about the encroachments of corporations. I, for one, shall not discuss the subject." In two large State institutions with which the writer is acquainted scarcely any interest whatsoever is manifested in election contests. One professor said outright that he did not agree with the party in power but it was not safe for him to vote his convictions. There is not in all the Southern States, between the Potomac and the Mississippi, a chair of political science; and the interest in sound instruction on political subjects is so weak that there is no agitation anywhere for the establishment of such departments. And instead of encouraging advance along these lines the so-called Ogden influence indirectly discourages it. Not one of the colleges that has profited by this new movement, not one whose officials affiliated with Mr. Ogden and his board, has done anything to encourage freedom of speech on economic subjects. An excellent institution whose faculty lays especial emphasis on the utmost freedom of opinion on the race question has never said a word about the scandalous bribery and tyrannical conduct of certain great corporations operating under its very nose. The editor of a particularly able Southern magazine recently refused to publish an article from one of its regular contributors: the rejected manuscript was an arraignment of present industrial abuses in the South.

The General Educational Board of New York and the subsidiary Southern Education Board proclaim the greatest freedom of speech; but none of their members, with the notable exceptions of Albert Shaw and George F. Peabody, and none of their supporters in the South have ever found it possible to condemn publicly the methods of

Mr. Rockefeller, their great benefactor. This is distinctly discouraging to those who have hoped still for better things, who even now wage a steady warfare against backwardness and deeply entrenched tradition. How can we ever bring our people to the highest level of civilization, to real productivity in statesmanship, in letters and the arts, when a great field of activity is closed against investigation on the part of college men, when colleges unanimously decline to entertain any opinions on these subjects. If one great theme is tabooed why not the others? And if Southern colleges fear to speak their minds or fail to find their voices, who will take the lead toward the complete and more perfect freedom?

These are Southern conditions; in calling attention to them the author does not mean to imply that Northern colleges are freer from the blighting influence of special interests. Indeed, it would seem that we have no such thing as academic freedom in America, and there are not a few who openly assert that such is the case. But in the old South, where such remarkable changes are taking place and where complete freedom of discussion is so absolutely essential in the face of extraordinary difficulties, it does seem that all our forces making for progress might be united in the great cause.

WM. E. DODD.

Randolph-Macon College, Ashland, Va., April 15.

THE HYPOTHETICAL QUESTION.

TO THE EDITOR OF THE NATION:

SIR: Is not the time ripe for the attentions of thoughtful men, and in particular members of the legal profession, to be directed to the abuses of the "hypothetical question?" In theory the question is a valuable tool. Its purpose is to spread before the medical expert in an abstract form, wholly divested of complicity, or such extraneous matter as would tend to sway the emotions or on the other hand develop a bias, certain essential conditions that have been proved to exist in the case before the court. Based upon this array of facts, in conjunction with his special knowledge, the medical expert is expected to produce "an opinion." It has developed into custom and is ordinarily expected that this opinion be delivered without delay.

Though it is true that the verdict of the jury should be derived from the consideration of facts; yet as the opinion of the expert is of necessity on matters upon which judge, jury, and counsel have little or no knowledge, and is submitted for the purpose of illuminating a subject that would otherwise remain obscure, it follows that the "hypothetical question" (and its answer, the "opinion" of the expert) is in truth part of the assets upon which the jury must draw in formulating its verdict, and should be as scientifically accurate, as concise and as simple, as is feasible under the inherent difficulties of the situation. From this obviously same point the "hypothetical question" has been permitted to roam a great distance. As a matter of fact, it often serves as an occasion for browbeating on the part of counsel, and its practical effect is usually to obscure the main scientific issue by extravagant intricacies of verbosity. As a choice example, the press credits W. T. Jerome, in the current Thaw trial, with a "question" which consumed one hour and eighteen minutes in the reading.

In addition to the brow-beating, above noted, it is not to be denied that only too often the purpose of the "question" is not to arrive at definite and scientific conclusions; but, violently wrested from its rightful sphere, it is employed to confuse and befuddle the witness into committing himself to categoric statements, to be later shown either conflicting or impossible. Though the witness is privileged to demand a clear exposition of each part of the question, yet the fact remains that the artificial atmosphere generated by counsel and only too frequently permitted by the presiding judge, tends to invalidate the opinion and throw discredit on the man who demands explanation or time for consideration. Nor is the recent statement of a personal friend, a learned ex-judge—"so far as that goes, doctor, *the expert witness is expected to be qualified to answer these hypothetical questions without delay, for the reason that he is an expert*"—beyond criticism. For a fool can ask in five minutes what a wise man cannot answer in five hours; and it is common knowledge that, according to a universal and time-honored custom, attorneys reserve the right to "consult the authorities" and withhold "an opinion" until adequate consideration of these sources has been acquired.

My colleagues may be flattered by the delicacy of such a compliment and the knowledge of the esteem in which their opinion is held by members of the legal profession. But the delicacy would be enhanced and truth and justice be more surely attained if the "questions" were employed solely for legitimate ends, and the ideas of counsel clothed in a becomingly modest verbiage, free from an assumption of profundity that presses hard the pronouncements of a Mary Baker Eddy. At present the expert offers judge and jury practically nothing of value, and his evidence is regarded but lightly.

The truth is that the system of expert medical testimony, as employed in our courts to-day, is non-scientific and wholly inconclusive, and should be subjected to immediate and drastic alteration.

NORVELLE WALLACE SHARPE.

St. Louis, April 11.

VITTORIA COLONNA.

TO THE EDITOR OF THE NATION:

SIR: Your notice of Mrs. Jerrold's "Vittoria Colonna," in your issue of April 11, recalls an interesting article on Vittoria Colonna attributed to T. A. Trollope and published in a cheap reprint entitled "Lives of Celebrated Women." The article perhaps impressed me unduly because of my lack of knowledge of the subject, but it certainly presents a very clear and concise account of the life of the poetess and introduces several selections from her sonnets written in memory of her husband, giving them in the original and also in good translation. Then the writer passes on to her religious sonnets, giving selections from them in the same way and taking a broad-minded and philosophic view of the religion and politics of the distinguished woman who was not censured by the Church for her Protestant poetry and who did not feel obliged to leave the Church for having written into her sonnets doctrine for which fellow reformers were condemned and went into exile.

I should be glad to learn how Trollope's sketch is valued by others acquainted with the subject. S. W. HATHEWAY.

Boston, April 17.

AN EARLIER TIRYNS.

TO THE EDITOR OF THE NATION:

SIR: Readers of the *Nation* will doubtless be interested in the announcement which has just reached me from Nauplia that Dr. Dörpfeld, who has been making further excavations at Tiryns this spring, has found an older, prehistoric city on that site underneath the one which Schliemann excavated. The newly-discovered city had none of the extensive system of galleries and fortifications which are most characteristic of the later city. In this particular at least it would seem to approach the Cretan palaces at Cnossus and Phæstus. Naturally not much is yet known about "Tiryns I.," but archæologists will hope that the excavations, which cannot be completed this year, will soon be resumed for the light the discoveries may be expected to throw on the relations existing between the Minoan and the Mycenæan States.

OLIVER M. WASHBURN.

The University of Chicago, April 20.

Notes.

J. D. M. Ford, just appointed to the Smith professorship of Romance languages at Harvard, is writing the volume on "The Novel" for Prof. W. A. Neilson's Types of English Literature Series, to be published by Houghton, Mifflin & Co.

The Macmillan Company has in press two more volumes of Lord Acton's remains, edited by the Rev. J. N. Figgis and R. V. Laurence.

Fleming H. Revell Company will soon have ready for publication a volume of sermons by Dr. Charles F. Aked, to be called "The Courage of the Coward."

In January of next year the faculty of the Harvard Divinity School will issue the first number of a quarterly magazine to be called the *Harvard Theological Review*. It will be edited by Profs. G. F. Moore, W. W. Fenn, and J. H. Ropes. The necessary support comes from a bequest of the late Miss Mildred Everett, who thus carries out a plan suggested by her father, Prof. C. C. Everett.

With the publication this week of the fifth volume of Plato in the Oxford Classical Texts, Prof. J. Burnet accomplishes a task that no one has undertaken since Stallbaum edited the complete works forty years ago.

The Wyclif Society, founded twenty-five years ago by Dr. F. J. Furnivall, F. D. Matthew, and the late Prof. Montagu Burrows, makes an appeal for funds to complete its edition of the reformer's works. All communications should be addressed to the secretary, Miss Dorothy G. Matthew, No. 56 Fellow Road, London, N. W.

The Buffalo Historical Society is preparing a volume of the letters and writings of President Fillmore, and desires information in regard to any MSS. which may be used for this purpose. Fillmore was one of the organizers and first president of the society.

In December, 1897, a loan exhibition of rare articles of historic interest was held at the residence of the Misses Baldwin in Bangor, Me., and among the pieces was the manuscript of "The Revolutionary Journal of Col. Jeduthan Baldwin." The De Burians, a society of bibliophiles of Bangor, have now published the Journal in excellent form, with a memoir of the writer and illustrative notes. The previous publications of the club, we may say, were "Peter Edes—Pioneer Printer in Maine, with His Diary while a Prisoner by the British in Boston just after the Battle of Bunker Hill," and "Moses Greenleaf—Maine's First Map-Maker, His List of Indian Place Names, and a Bibliography of the Maps of Maine." Col. Baldwin was at Ticonderoga and thereabouts during the contest with Burgoyne, and the most interesting portion of his Journal deals with that period.

Early in the summer the Burrows Brothers Company will reissue their "Lincoln-Douglas Debates." The new volume will be more convenient in format and lower in price.

Volumes xi. and xii. of the "Comnlete Works of Abraham Lincoln" bring to an end a notable undertaking for a new publishing house, Francis D. Tandy Company. The eleventh volume, besides the latest of Lincoln's own writings, contains the long Bibliography compiled by Daniel Fish; the twelfth is made up of au Anthology of brief paragraphs from the letters and speeches, followed by Chronological and General Indexes. We have already called attention to the excellences of this edition, and ueed not now be specific. Since Lincoln's works were first published by Messrs. Nicolay and Hay in 1894, much new material has come to light, and this has been incorporated into the body of the present volumes. The text throughout has been so far as possible printed in accordance with the MSS. The first volume opens with Richard Watson Gilder's essay on "Lincoln as a Writer," which serves as a suitable introduction, and the other volumes contain a selection of memorable speeches and papers on the President. A notable feature of the work is the large number of portraits of Lincoln. Altogether, this Gettysburg edition takes its place worthily among the great editions of our statesmen.

Old newspaper correspondence is, in general, a most unpromising dish to be warmed over; and the two volumes of the "Memoirs of 'Malakoff'" (London: Hutchison & Co.) do not constitute an exception. They are made up almost entirely of the letters written from Paris to the New York *Times*, during the reign of Napoleon III., by the late William Edward Johnston, and edited by his son, Professor R. M. Johnston. Here and there an interesting passage can be found, but as a whole it is a very ordinary correspondence, of which the dry bones cannot, at this late day, be made to live.

"Mexico's Treasure-House (Guanajuato)," by Percy F. Martin, is published by the Cheltenham Press, New York, and is a full account, with many illustrations, of the mines of a region which has been pronounced more "thoroughly mineralized" than any equal portion of the globe. The description is technical and highly detailed. Perhaps the most suggestive parts of the volume are those which tell of the new methods, mostly devised by Americans, to draw fresh wealth from the old workings.

Leslie Stephen's "English Literature and Society in the Eighteenth Century," the Ford Lectures for 1903, has been issued by G. P. Putnam's Sons in their uniform edition of Stephen's works. The book was reviewed at length in the *Nation* of April 14, 1904, when it first appeared. The lectures, we may remind our readers, do not exhibit Stephen at his best. The subject was one with which he was thoroughly familiar; it afforded him opportunity for many passages of shrewd comment and keen analysis. And yet the whole is not so thoroughly knit together and so happily phrased as the work of his prime. For one thing, the lectures never received his final revising touch. Failing health made it impossible for him to undertake "the task of serious correction," or even of delivery. His nephew, Herbert Fisher, read them. Had Sir Leslie gone over the proofs with his usual care he would not have spoken (p. 117) of "the lecture which Henry Tilney in 'Mansfield Park' delivered to Catheriue Morland." The novel should be "Northanger Abbey."

The old black-letter ballads have an interest, and even charm, which is quite independent of any literary value—to which, indeed, very few of them can lay claim. Typography, titles, the rude woodcuts which often accompany them—all are equally quaint, and not less so is the treatment of the varied matters with which they are concerned—murders, monstrous births, contemporary public events, religious exhortation, etc. A valuable addition to this form of popular literature is the volume which has just issued from the Clarendon Press (Henry Frowde), entitled "The Shirburn Ballads, 1585-1616," edited by Andrew Clark, honorary fellow of Lincoln College, from the manuscript in the library of the Earl of Macclesfield, at Shirburn Castle, Oxfordshire. The manuscript originally contained 257 leaves, of which about 100 have been lost, but even what remains makes up, as the editor remarks, "a singularly representative collection, embracing ballads of almost every type in circulation, and so presenting us with just the library which was found in most English households in Shakespeare's time." The pieces were evidently all transcribed in the early seventeenth century from the printed copies known as broadsides, and the majority of them have already appeared in the "Roxburghe Ballads," but even of these we have often in the present collection earlier and better texts; and, on the other hand, some of the best are printed here for the first time. Perhaps the greatest importance of the collection is that it bridges over the gap in ballad-literature between the early ballads as represented by Prof. F. J. Child's monumental work and those of the post-Restoration period. One may note among the new pieces some that have a distinct literary value, as, for instance, No. 13, entitled "The Golden God Hyperion," a charming Elizabethan pastoral, which, like No. 28, Dyer's "My Mind to Me a Kingdom Is," we suspect had originally no place in the literature of the ballad-singers. Two or three of the ballads which are of interest to Shakespearean scholars, such as that on the story of Titus Andronicus or the one on Jephthah's daughter (quoted in "Hamlet"), have already appeared in print. Mr. Clark, however, fails to note that in No. 65 we have at last the "old madrigal" long ago conjectured by Malone to explain Orlando's phrase, "Wit, whither wilt," in "As You Like It." The editor has reproduced the manuscript text practically without changes. He has, moreover, prefixed to each ballad explanatory notes, and in his general introduction he has set forth the conditions under which ballads were composed and circulated in the sixteenth and seventeenth centuries. Finally, several interesting ballads of the same character as those in the Shirburn manuscript are added in an appendix from a Bodleian manuscript, viz., Rawlinson poet. 185.

In "The English Factories in India" (New York: Henry Frowde), William Foster continues for the years 1618-1621 the publication of the documents which have become familiar in the six volumes of "Letters Received by the East India Company from Its Servants in the East." Sir Thomas Roe, who wanted to go home in February, 1618, was persuaded to stay another year, for he found favor in the sight of Jahangir; he was a Joseph in the court of Pharaoh, for whose sake all his nation there seemed to fare the better. He developed a trade with Surat in the Persian Gulf beyond Ormuz, and with Mocha just inside the mouth of the Red Sea, where spices from the Bantam factory and cottons from India could be sold to the merchants from Egypt, who frequented the pilgrim ports. In these regions the Portuguese had been exacting from native junks heavy sums for protection and for permission to sail the high seas. This went against the grain of a good Englishman like Roe. He would rather take as prize a junk or two and make the natives look to the English as their protectors. "By this course wee shall hinder and bridle the Portugall of his profitts and force him to some composition with us, when hee sees wee beginn soe round a course." And he would act at once on this policy, "els the Duch wilbe beforehand and do it first, and then hee wilbe the brave man." Eastward of Cape Comorin it was the Dutch, rather than the Portuguese, who gave the English the most trouble:

> They wrong you in all parts and grow to insufferable insolences. You must speedelye looke to this maggatt; els, wee talke of the Portugall, but these will eate a woorme in your sides (p. 17).

Sir Thomas Dale, known for his energy and firmness in Virginia, was sent to the Spice Islands in 1618 with six vessels to teach the Dutch manners, but without success. He soon returned to India, and died there in August, 1619, "after maney testemoneys of good Christianety." It is not so generally known that the Danes also caught the seventeenth century Indian fever. While the English Company forbade

its servants to take out their wives with them or to marry in the country, and discouraged colonial or political settlements, the Danes sent out many women and children in their fleet of six ships in 1619; they intended to make a settlement at Ceylon, but the Portuguese soon put an end to their hopes.

The existence of any Hungarian literature worthy of study is due largely to the patriotic enthusiasm of a few writers less than a century ago. The existence of Dr. Frederick Riedl's "History of Hungarian Literature" (D. Appleton & Co.) was also due to an outburst of enthusiasm. Its editor, C. Haghorg Wright, while visiting in Budapest some years ago, was assured that if the series of Edmund Gosse's Literatures of the World could he enlarged hy a book on Magyar writers, the Hungarian Academy would commission "the ahlest exponent of Hungarian literature in Hungary to write it, and present the manuscript" to him as a gift. Professor Riedl of the University of Budapest was selected. In due time the work was completed, and was translated into English hy a Hungarian lady and her hushand, with aid from Mr. Wright, who says that he furnished all the anonymous metrical translations and revised all the other metrical translations. They certainly needed such revision, and more. Unfortunately English poets who have tried their hands at rendering Magyar verse are few, and the specimens given are for the most part very wooden. Dr. Emil Reich's "Historical and Critical Survey of Hungarian Literature" was puhlished with an exeellent map not quite ten years ago. Dr. Reich was also a Hungarian, and knew what he was writing ahout. Between the two, one can get a comprehensive survey of the suhject. According to Dr. Reich the numher of Hungarian writers was then not less than 5,000. When one is informed that the Hungarian Academy is puhlishing twenty-five or thirty large volumes of the letters only of Kazinczy Férenc, who in his zeal to rejuvenate the ancient Magyar tongue added a multitude of new words, more than 6,000 of which remain a permanent acquisition; and that the characters represented in Jokai Mor's novels would "line a street for more than a mile"; and that these are only two of a multitude of most prolific poets and novelists—one realizes that a thorough knowledge of this literature is an impossihility. Professor Riedl's book is certainly more interesting than its rather text-hookish appearance would indicate. There are a good many entertaining anecdotes, some clever recapitulations, and a vast amount of out-of-the-way information. There are a few misprints, and it would have heen a distinct addition had the editor seen fit to append a key to the pronuneiation of the diffieult names and words that occur.

Some time ago, in reviewing M. Fernand Baldensperger's admirahle study of Goethe's literary influence, "Goethe en France" (Paris: Hachette), we called attention to the faet that its charm was enhaneed hy the ahsence of all critical apparatus, which the author preferred to puhlish separately for the henefit of specialists. This apparatus has now heen brought out by the same puhlishers, under the title of "Bihliographie critique de Goethe en France," and will prove invaluable to students of French literature in the nineteenth eentury. The bibliographical material is arranged in accordance with the divisions of the original book, and is adequately annotated. The work thus completed is a significant contribution to the ever-increasing study of comparative literature.

The editor of the *Revue de Paris*, Victor Bérard, repuhlishes in book form a number of articles on the relations of Franee and Germany since the Morocco Confereneee. His title is "La France et Guillaume II." (Paris: Colin), and his thesis is that economic interests and hank negotiations have been the underlying factors around which French and German diplomacy have struggled. He contrasts the poliey of M. Delcassé, a statesman of the older school, with that of M. Rouvier, a practical expert in questions of banking and finance. He dwells complacently on the weakness of Germany in raw material and capital resourees. He suggests, where he does not state, the action of the French hankers in bringing Spain into line with the poliey of the republic, and of the French Government in restraining the investment of French capital for the Bagdad railway and other near-East German operations for which Berlin cannot find the money. The book is hrilliantly written and will repay perusal.

A German jurist of distinction, Dr. Paul Herr, has just published a work entitled "Das Moderne Amerikanische Besserungssystem" (Berlin: Kohlhammer), in which he describes the methods employed in the United States for the moral improvement of youthful criminals by juvenile courts and reformatories. He dwells particularly on the organization and efficiency of the institution at Elmira. The volume contains the results of the author's personal ohservations and investigations in this country, and he now seeks to have the same system in its essential features introduced into Germany.

The annual report of the Michigan Library Commission notes as the important feature of its work during the past year, the establishment, in each of the normal schools of the State, of training elasses in lihrary science and usage. The ohject of these courses is to give the teachers of the rural schools, who are generally the custodians of the school lihraries, the elementary training which will enahle them to use and to help pupils to use these lihraries intelligently. All who complete the course receive credentials, certifying that the holders are qualified "to select hooks and manage small libraries that may come under their care."

For several years there has heen an exchange of language teachers hetween several secondary schools in France and in Germany, nearly all of these in institutions on the border. A leading Berlin journal reports that the Prussian educational authorities have under consideration sueh an exchange for the practieal acquisition of foreign tongues between Germany and some Ameriean colleges. Something of this nature was introduced in the Berlin University during the recent Easter vacation, when douhle *Ferienkurse* were held, the lectures and practieal exercises heing conducted hy Englishmen, the whole in charge of the English lector at the university, F. Sefton Delmer, who himself lectured on Dickens and his times. All the work was in the English language.

Theodor Aufrecht, the Sanskritist, died, in his eighty-seventh year, at Bonn, April 3, just "three years and three days" (an orthodox Hindu interval) after the great lexicographer, Boehtlingk. Aufrecht's death marks the close of the second great epoch in the history of Indian studies in the Occident. The founders, Sir William Jones. Colehrooke, Bopp,—these have long been gone; and now, at last, of the men who were most illustrious in the second half of the last century, Boehtlingk, Roth. Weber, Max Müller, Whitney, not one is left. Aufrecht was of the type, now rare, in which special knowledge of Sanskrit was comhined with great learning in comparative grammar; most people have forgotten that what has for half a century heen called Kuhn's "Zeitschrift" was originally (1851) Kuhn and Aufrecht's; and the monumental volume on the Umhrian language ("Umhrische Sprachdenkmäler") was the joint work of Kirchhoff with Aufrecht. His chief claim to distinetion will doubtless be the fact that he was the first to puhlish the "Rig-Veda" in its entirety, although Müller's edition with the native seholia was hegun and partly issued years hefore Aufrecht's. There is no man living (and we would not except even the native scholars of India) who has examined and read and eatalogued so many manuscripts of India as Aufrecht has done. His "Catalogus Catalogorum" is a vast repertory of information ahout the titles and authors of the immense mass of works that form the Sanskrit literature.

André Theuriet, the French novelist and poet, died on Tuesday. He was horn in 1833, a native of Marly-le-Roi. He studied at Bar-le-Duc, and went up to Paris for his examinations. In 1857 he entered the office of the Minister of Finance, hut his interests even then were literary and he began to puhlish fugitive verses—chiefly in the *Revue des Deux Mondes*. From 1857 to 1872 he produced a considerable body of verse, some of it of very charming quality. "Le Chemin des Bois" was especially commended by the Academy in 1867. In 1874 Theuriet appeared as a novelist, his first venture heing "Mademoiselle Guignon." Among his other stories are "La Fortune d'Angèle," 1876; "Le Filleul d'un Marquis," 1878; "Tante Aurélie," 1884; "Claudette," 1900; and "Le Manuscrit du Chanoine," 1902. He was elected to the Academy in 1896. His work bore a certain intimate and charming quality which was derived from the sincerity with which he depicted the simple provincial and rural communities among which he had passed his life.

The death is announced of Dr. Alexander Machain, headmaster of the High School of Inverness. He was horn in 1855, and educated at Aherdeen University. For a time he edited the *Celtic Magazine*. He was best known hy his "Etymological Dictionary of the Gaelic Language," 1896. Another of his books is "Celtic Mythology and Religion," 1885.

NOTES ON TEXT BOOKS.

Prof. W. A. Merrill, for years a devoted student of Lucretius, has published an edition of the "De Rerum Natura" (Morris and Morgan's Latin Series, American Book Co.), in which his principal object is "to bring into compact form the results of critical work on the poem since Monro's posthumous edition of 1886, and also to indicate the sources of criticism prior to 1886 that were either disregarded by, or unknown to, that great scholar." This object is certainly accomplished in the volume before us. While it will not entirely supplant Monro, it must henceforth be consulted as one of the standard explanatory editions of Lucretius. The introduction reviews judicially a mass of utterances on the life of Lucretius and the characteristics of his poetry and philosophy. An editor may well limit himself to an annotated *catena;* we hope Mr. Merrill may soon give us an essay on his poet. Though devoutly a Lucretian, he writes with a tempered admiration; he can refer sympathetically, as Monro could not, to Conington's enthusiasm for Virgil. The influence of Lucretius on modern literature and modern thought is treated in an informal but comprehensive fashion; even the latest theory of radio-activity receives its due. Throughout the introduction and the notes, Mr. Merrill brings to bear on his author reflections amassed from wide reading in various fields. At the end there is a valuable index, by no means identical with that of Monro. For textual criticism, the reader must still turn first to Monro. It is a pity that there is not at least a brief *apparatus criticus*, especially as the notes contain a number of valuable discussions of the text. It is also lamentable that an important edition like this should not be better printed. The introduction and the text appear in large and staring type, which shows through the thin paper. The notes present a more attractive appearance. We have noted the following inaccuracies in the introduction: p. 11, the life of Virgil by Donatus might be referred to its generally accepted source, Suetonius; p. 17, the "spurious letter entitled *Valerius Rufino ne ducat uxorem*" in the "Migne edition of Jerome, vol. xi., p. 259," should be referred to its author, Walter Map, and cited from the edition of Thomas Wright (Camden Society, vol. 50).

"Lucian, Selected Writings," by Prof. F. G. Allinson, is much more than a book for college students, though admirably adapted, as it is intended, for use in the curriculum. (White, Seymour and Gulick's College Series of Greek Authors, Ginn & Co.) Mr. Allinson combines literary and linguistic interests in a manner worthy of his master, Gildersleeve. The introduction treats of the life and times of Lucian, his language, his influence on later literature and art; here and throughout the book there is much of importance for the student of comparative literature. The selections vary somewhat from those ordinarily presented in English editions of Lucian; each of them is provided with a careful preface. The notes are helpful and scholarly; they contain abundant, but not too abundant, citations from modern literature. Mr. Allison's exuberant style would profit by repression.

Among Appleton's Twentieth Century Text-books appears "The Mythology of Greece and Rome," by Prof. Arthur Fairbanks, "presented with special reference to its influence on literature." For this reason the book at once challenges comparison with Prof. C. M. Gayley's well-known work, "Classic Myths in English Literature," which it will hardly displace. Gayley's method is more attractive and artistic; besides systematic lists at the end of the book, appropriate quotations from literature are woven into the text. Mr. Fairbanks has the lists, with some quotations, at the end of each narrative, adding various references to those given by Gayley, but his text is a unit without these appendages. It does not show so effectively, therefore, the literary continuity of the myths. The distinct merit of the book is not that which is emphasized on the title-page; it is, rather, the fact that the ancient stories are told by a professional student of mythology who is familiar with the results of recent investigation. The illustrations, which are drawn exclusively from ancient art, are more numerous and far better than those in Gayley. In short, the new book is a valuable supplement to the old one; both should be useful for high-school or college courses. On p. 12, a Euhemerism is credited to Lemprière that should be carried back to Livy (I., 4, 7); on p. 233, Sisyphus, not Tantalus, should roll the stone up-hill.

A helpful little volume for the sympathetic reader of Latin verse is Prof. L. J. Richardson's "Helps to the Reading of Classical Latin Poetry" (Ginn & Co.). In contrast with certain theories promulgated in recent years by American scholars, it is refreshing to find due attention paid here to the rhythmical ictus. Word-accent and the careful distinction of long and short quantities are indispensable, too, but better the old-fashioned sing-song than a method which informs the learner that there is no essential difference in the reading of poetry and prose.

The latest volume in the Greek series edited by Prof. H. W. Smyth (American Book Co.) is a "Beginner's Greek Book," by Prof. A. R. Benner of Andover and Professor Smyth. Sixty lessons present attractively and sensibly the essentials of Greek grammar. The editors have taken special pains to distinguish between the less and the more frequent words and constructions of the "Anabasis," but their efforts to concentrate the pupil's attention on immediately useful material have not countenanced short cuts to knowledge; the dual retains its place in the paradigm. The book is beautifully printed; the illustrations illustrate, and are not too numerous. We should like to begin Greek again with Benner and Smyth.

The "Chanson de Roland," edited by Prof. James Geddes, jr., of Boston University (the Macmillan Co.), is one of the most important attempts yet undertaken to make the old French epic familiar to American students. The text is given in a modern French rendering based on Müller's edition, and is accompanied by an elaborate apparatus of introduction, bibliography, notes, and manuscript readings. Indeed, the chief criticism is the question for what class of students the book is intended. The translation is evidently meant for those whose knowledge is confined to modern French. The elaborate bibliography, based on that of Gautier, but brought up to date, will be of great use to maturer students of philology and mediæval literature, but to them only. With this reservation all comment must be favorable. The large amount of information contained in the volume is well classified and systematized for reference, and is accompanied by maps and useful illustrations. Professor Geddes's judgments on controverted points and obscurities are conservative and sound.

Prof. Arthur Graves Canfield of the University of Michigan, whose "French Lyrics" have had considerable popularity, undertakes in his "Poems of Victor Hugo" (Henry Holt & Co.) the useful task of selecting for students the best material scattered through numerous and therefore expensive volumes. The average American unfamiliar with French except by translations, knows Hugo as a rule only as the author of novels like "Les Misérables" and "Notre Dame." To these the college student may have added "Hernani" and "Ruy Blas." Professor Canfield has therefore done well to prepare this anthology of the most characteristic sounds of Hugo's *écho sonore*. If ever French poet needs to be read in selections by the American student, bewildered by such a mass of material, it is Victor Hugo. The volume is accompanied by a brief introduction.

Recent additions to the Oxford Higher French Series (Henry Frowde) are editions of Hugo's "Hernani," selections from Alfred de Musset, Stendhal's "Racine et Shakespeare" and selections from Madame de Girardin's "Lettres parisiennes." The first two compare well with the student's editions already before the public. The last, prepared respectively by the general editor, Léon Delbos, and by F. de Baudiss, are an innovation in the sphere of French educational texts, and in this country, at least, the volumes will have to create their own market. The edition of Stendhal does deserve to be read by the general student. The need of the other is less apparent. M. Delbos has accompanied his text by a long introduction in French in which certain relations between art and literature are developed in an interesting way. The mechanical get-up of these volumes is not prepossessing.

"Deutsche Sagen" is the title of a little volume edited by Franziska Geibler, of New York, and published by Longmans, Green & Co. As another collection of the Germanic legends always in demand in introductory courses, the book is likely to meet with success; but it is strangely deficient in the absence of notes, and its word-for-word vocabulary is inadequate—as, *aussah*, looked, with no mention of *aussehen*.

"Deutsche Reden" is the attractive title of a series of well-selected speeches by Bismarck, Schurz, Emperor William II., Bebel, Moltke, Blum, Richter, Bülow, Dahlmann, Bennigsen, and others, put together for advanced students of German by Rudolf Tombo, sr., and Rudolf Tombo, jr., of Columbia University, and published by D. C. Heath & Co. Such a book has long been wanted, not so much because of a scarcity of difficult prose, but because most of the selections previously available have not been sufficiently interesting. How well these

painstaking editors have achieved their end and provided variety in style and subject may be seen in the thirteen speeches, covering some 219 pages, and touching upon important political movements of the world's history—including events in the United States—from the middle of the nineteenth century to the Anglo-Japanese Treaty of 1905, and the subsequent treaty of Portsmouth. There is a clear and vivid picture of the struggle for German unity, and an insight into the tremendous industrial and political development of Germany from the refounding of the empire. The arrangement of the speeches in alphabetical order is perhaps a mistake, since the shortest and least difficult should be read first; but the volume is embellished with a map, and there are sixty-nine pages of literary and historical notes, several of the biographical sketches being particularly well done.

The more advanced students of mathematics will be interested in three books published this year: "Introduction to Infinitesimal Analysis: Functions of One Real Variable," by Oswald Veblen and N. J. Lennes (New York: Wiley & Sons); "Elements of the Infinitesimal Calculus," by G. H. Chandler, third edition (Wiley); and "Differential and Integral Calculus," by G. A. Osborne, revised edition (Boston: Heath & Co.). For more than a century after the inventions of analytical geometry and the calculus, mathematicians and physicists may be said to have fairly rioted in applications of these instruments to physical and geometrical problems, without concerning themselves about the nicer questions of cogency and precision. The need felt in the latter part of the eighteenth century of putting the new science into a comprehensive system, led to the imposing textbooks of Euler in Germany and of Lacroix in France. These works revealed in a startling way the necessity of improving foundations. Then began the still advancing critical movement under the powerful impulse and leadership of Cauchy. Since that time the calculus has been not only a tool, but a subject of investigation; and, always the most powerful, it has now become the most refined instrument of human thought. Accordingly every genuine university now offers two courses in the calculus: an elementary course, designed to equip the student with the calculus viewed as an instrument for making rough investigations, and an advanced course designed to qualify him to use the calculus in the most exact and subtle thinking. The books by Professor Chandler and Professor Osborne, as designed for the beginner, have numerous rivals in the English language. On the other hand, the work of Messrs. Veblen and Lennes, being designed for advanced study, has but a single English rival, namely, "The Theory of Functions of Real Variables," by Prof. James Pierpont, which was noticed in these columns September 6, 1906. Prior to the appearance of Pierpont's book, an American or English student of the advanced modern calculus had to depend upon such foreign works as Jordan's "Cours d'Analyse" and Stolz's "Allgemeine Arithmetik." The aim of such critical work being precision and logical perfection, it tends at first to become prolix and only at last succeeds in becoming concise. The most conspicuous merit of the work of Messrs. Veblen and Lennes is the union of conciseness with rigor. This union became possible by means of two economical devices. One of these is the happy definition of the limit of a function in terms of the notion of "value approached." The other consists in the systematic employment of a recently established theorem in the doctrine of assemblages, namely, the Borel theorem, so called after its discoverer. The utility of the book would be much improved by the introduction of numerous examples and illustrations. In this third edition of his book, Professor Chandler has made some changes to bring the treatment and content into fuller accord with modern demands both of rigor and of utility. The basis is laid in the doctrine of limits. The differential notation is introduced at an early stage, and, everywhere throughout, the reader finds the abstract notions and processes illuminated by simple application to concrete problems, chiefly of geometry. The closing chapters afford an excellent introduction to differential equations and mechanical integration. Taken all in all, it is one of the very best of existing books for the student of engineering, for whom it is primarily designed. By introducing a chapter on series, by rearranging the order of topics, by the earlier geometric illustration of the notion of derivative, and by the incorporation of physical and mechanical applications, Professor Osborne has amply justified the revision of his book, though his decision to give several definitions of the differential instead of but one cannot but annoy the instructor and confuse the pupil.

"A Text Book on Hydraulics," by L. M. Hoskins, professor of applied mathematics in Stanford University (Henry Holt & Co.), is, according to the preface, "designed primarily for the use of students of engineering in universities and technical colleges. In its preparation the aim has been to present fundamental principles in a manner both sound and as simple as possible." This aim the author has carried out successfully both with respect to the treatment of the mechanics of incompressible fluids, or hydraulics itself, and the application of the principles to turbines and turbine pumps. There is, however, a distinct lack of the engineer's point of view, as might be expected from a professor of applied mathematics. The material given on pumps and turbines serves very well as an introduction to the subject for some students of engineering, but students who expect to practise this branch must go further. Moreover, the book lacks practical data in the form of tables or curves to facilitate application of formulas and practical computations. The relative value of several formulas for the same purpose is not stated with sufficient clearness for the young engineer to solve a problem on the flow of water in various channels, on turbine design or installation. The book is distinctly elementary, and as such is well written and supplied with good examples.

"Boiler-Waters," scale, corrosion, foaming, by William Wallace Christie (New York: D. Van Nostrand Co.), is devoted to the chemistry of boiler waters and the relation of the structure of boilers, feed-water heaters, economizers, etc., to the impurities in water. The work concludes with a chapter on water softening for the removal of these impurities. The book is well written and printed; and the material is of great value, but it would be of greater value if the author, instead of quoting the opinions of engineers and chemists on disputed points, had made a more determined attempt to solve the difficult questions. The number of quotations, presented with little or no critical analysis, is unduly large, and seems to indicate a lack of ability on the part of the author to judge between the various opinions. The chemistry presented is not new to chemists; nor is the matter on boilers and heaters new to engineers. The relation between the chemical and engineering issues is, however, well brought out, and on this account the book will no doubt prove useful.

There are so many manuals of qualitative analysis on the market, practically alike except for the author's name on the title page, that any new candidate for popular favor is viewed with *a priori* suspicion and must justify its appearance by showing that it has something to distinguish it from its rivals in the field. The new "Qualitative Analysis as a Laboratory Basis for the Study of Inorganic Chemistry," by Assistant Prof. W. C. Morgan of the University of California (The Macmillan Co.), has such justification, and will be welcomed by many teachers who wish to make the modern theories of solution the basis of analytical work, even in elementary classes. A large and increasing number of teachers, especially in the West, have come to believe that students take to ions as readily as to atoms, and that when they are accustomed to look at all reactions from the point of view of equilibrium, qualitative analysis becomes something more than a training in detective tricks. Professor Morgan's book is intended for the laboratory work of a freshman year in inorganic chemistry, so it is not a mere collection of technical recipes, but a course of general educational value. The discussion of the laws of solution and equilibrium is more thorough than usual, occupying sixty pages, but is not always as simple as it might be. The ordinary and unaided student would be discouraged, for example, by the statement with which the paragraph on mass action begins. The analytical tables are very complete and well arranged. Professor Morgan has adopted all the modern improvements; arrows are used in reactions instead of the sign of equality; the reagents are made up on the normal system; the orthography recommended by the American Chemical Society is consistently employed, as, for example, *oxid* and *sulfid*.

In his small "History of Chemistry" (Longmans, Green & Co.) F. P. Armitage tells "the story of some thousand years of almost fruitless labor, followed by two centuries of richest accomplishment." It is neither so comprehensive nor so interesting as Meyer's "History of Chemistry," but will serve its purpose in giving the student a background for his knowledge, and a realization of the difficulties experienced by generations of chemists in formulating the conceptions which now seem so simple and natural. Like most other histories of the science, this fails to connect with the science of the present day. The book might have been written ten or twenty years ago. To be specific in our criticism, in the discus-

sion of Berzelius's electro-chemical theory of combination some reference should be made to the modern tendency to use this conception in preference to its supplanters; in giving Mendelejeff's prophesy of gallium and scandium, mention should have been made of the argon group, which was not anticipated, and yet agrees in a way with the periodic law; and in developing the idea of valence, the history should have been extended to include the profound modifications which it is now undergoing.

"First Course in Zoölogy," a text-book for secondary schools, normal schools, and colleges, by Thomas Walton Galloway, has been issued by P. Blakiston's Son & Co., Philadelphia. It is no small compliment to this volume to say that it is well-balanced in its treatment of zoölogy in the widest sense. It is divided into two sections; a general part dealing with the broad biological problems which form the foundation of the science; and a special part, taking up the various phyla of the animal kingdom, beginning with protozoa and ending with mammalia. The most valuable feature is the successful way in which the second part is made "illustrative of the principles laid down in the general portion." The illustrations are well-selected and reproduced. The work is rounded out with a practical chapter on suggestions to teachers, and a comprehensive index. The author believes that the time of the pupil should be divided equally between field observation, laboratory work, study of the descriptive text, and reference to classical zoölogical authorities. In point of careful balance and common-sense use of questions, few recent text-books bear comparison with this volume.

"Practical Zoölogy," by Alvin Davison (American Book Co.) treats of the structure, life history, and relations of animals, with but a small amount of laboratory work. The attempt to cover such a large field in small space has resulted in a multitude of statistics, facts in regard to food habits, and detailed life histories, correlated only by a taxonomic arrangement. This plan cuts up the subject matter in such a way that the book instead of being adapted for continuous study by a pupil, is really much better for reference. The summary of characters under each of the scores of families is concise, yet comprehensive. While many of the numerous illustrations are fairly good, there is a great waste of paper and ink on touched-up caricatures, far from "representing facts more accurately than drawings." It is safe to say that no ornithologist living could identify the photographs purporting to represent the red-eyed vireo, wren, wood thrush at nest, young bluebird, and wild pigeon. The best part of the book is Division IV., treating of the young of animals, protection from enemies, vanishing forms, and origin of species.

CURRENT FICTION.

The Mystics. By Katherine Cecil Thurston. New York: Harper & Brothers.

Mrs. Thurston possesses imagination and a laudable desire to skip the dull parts, explanations, for instance. When John Henderson finds that his dead uncle has left him with a beggarly £500, and endowed a mystic sect with the bulk of his huge fortune, John calmly rifles the corpse, masters the "Scitsyin" (mystic equivalent for Bible or Koran) and vanishes for ten years. The fortune is not to go directly to the Arch-Mystics, but to await the appearance of a Mystic Messiah. In due time, after being well announced by a Precursor, there is forthcoming a Prophet, who unites many of the attributes of Buddha and Sar Péladan with the physical manifestations of a modern Englishman. Having been informed that "He will be Power made absolute," the Mystics immediately fall under his sway.

On the eve of securing the fortune and decamping with it, John is softened by the love and trust of a beautiful woman, and resolves to make a clean breast of it all to his congregation. This is quite fortunate, as the occasion which he chooses for confession had also been selected by a jealous brute of an Arch-Mystic (named Mr. Bale-Corphew) to expose him as a thief and impostor. The loyal Mystics forgive their Master, considering it quite excuse enough that John's father had been unjustly disinherited, and that he had always been an exemplary son. John, however, feels that his mother may not quite understand the position, but the beautiful woman (secure in the knowledge that mothers always are partial to strange daughters-in-law) volunteers to go along and explain things, and so, with much unction, the book ends.

The House of the Hundred Doors. By Will M. Clemens. New York: The Hawthorne Press.

This we take to be properly classified as fiction, though of the tractarian variety. Prefaced by a series of sentimental descriptions of a number of household pets, all dogs, as it chances, and all human, as is the nature of household pets, comes the harrowing picture of a vivisection laboratory. "Rich Man John," whose physical and moral identity are left in no doubt, succumbs to the evil advances of "two learned-looking men, a tall individual with whiskers and a hooked nose and a fat piggish fellow wearing blue glasses," and gives some millions of dollars for the establishment of a so-called Institute, which is really a Palace of Pain, where the little domestic friends to whom we have been introdueed, now lost, strayed, or stolen, are subjected in due time to nameless and purposeless atrocities which remind one of Hogarth's last stage of cruelty. The vivisectors are represented as alternately gloating and jesting over their task; and no gruesome detail is omitted to point the anti-vivisection moral—if it be a moral. We suppose the author is honest in his intention; but we beg leave to suggest that all physicians are not hook-nosed, piggish, or wantonly cruel; and that vivisection is not specifically a conspiracy against the household favorite.

The Princess. By Margaret Potter. New York: Harper & Brothers. 1907.

The Princess of this story is not the sublimated shop-girl of current romance, disporting herself in some new-found hole-and-corner kingdom. She is of the Imperial family of Russia, and of to-day. The events in which she is involved have but just taken place, and are not the stuff pretty romances are made of. Indeed, it would be hard to imagine an uglier situation than that upon which the action turns. The problem is one of heredity, and of the convention which obliges royal blood to deny itself the vulgar chances of marital felicity, thereby laying a respectable foundation for marital infidelity. The mother of the Princess has herself suffered all that could be suffered from marriage with a notorious libertine of the Imperial blood, yet has unhesitatingly given her daughter, a mere girl, and totally unprepared for the experience which is plainly before her, to a man of the same race and stamp. The Princess is not long in discovering his character. Naturally of pure nature and high spirit, she turns from him, bears him a child in shame, and wishes to die. But presently her motherhood absorbs her, the familiar yet always touching transfer of allegiance to the man-child takes place, and she is saved for further suffering. By the unhappy irony of inherited circumstance, she is herself responsible for the worst of this suffering. Her husband, the Prince, we are given to understand, might have been redeemed but for her cold pride and contempt. More than once he tries to be worthy of her and to win her love; but though she really cares for him, she makes no sign. He is driven back to his loose ways, his second *ménage*, his attitude of cynical indifference to anything beyond the pleasure of the moment. For the fate of the son she is also responsible. There is a little countess at hand with whom he might have been happy; but the mother thinks her an impossible match for her Imperial son. Meanwhile the stress of his inheritance is asserting itself, and he becomes, unknowingly, the favored lover of his own father's mistress. Here, the inevitable *éclaircissement*—the son commits suicide, the father is left, with dejected monocle, upon the strand from which, in one friendly boat, princess, countess, and mistress have departed. Whether they are sufficiently provisioned for so hard a voyage is a matter of doubt. Individually they become less and less probable as the story advances, as the atmosphere in which they move has become less and less real. The friendly ghost against whose advice both mother and mistress have wrought for the son's undoing—an audible conscience—becomes tedious as a piece of machinery. The Princess is too purely, and the mistress not sufficiently, a creature of circumstance, to give dignity to the final scene. Nevertheless the tale is in its way absorbing, and not likely to be at once forgotten.

The Isle of Dreams. By Myra Kelly. New York: D. Appleton & Co.

Nothing could have been more fatal to Miss Kelly's talent than for her to continue reproducing her original observations of the lower East Side in impressions of waning clearness and value. In breaking new ground, however, she is beset by many difficulties. It is much harder to write freshly about every-day people than to exploit an odd corner with humor and originality. In describing the girl and man of ordinary society, the very language is against her, and irresistibly groups itself into such customary arrangements as "a slim young woman, faultlessly but unobtrusively gowned."

There is no aid to be had from quaint erratic idioms. Her battle with words must be fought single-handed. In "The Isle of Dreams" she fights and—it cannot be denied—loses on almost every page; and yet such honorable defeat must command far greater respect and hope for her future than if she rested tamely content with the cheap victory of repeating well earned successes.

Her story has two themes, one banal and improbable—Miss Emerton's inviting her most charming friend to accompany her to her country house as a foil, which episode, with the ensuing complications, belongs in the realm of purely artificial fiction—the other highly original and interesting. An ambitious young woman painter suddenly finds that all her pictures have been bought by one man, that her apparent vogue has not been genuine, but merely the hobby of one fanciful collector, that at the point when fame seems assured, her spurs are essentially unwon. This situation is really worthy of more serious treatment than Miss Kelly accords it. Having brought it about, she apparently feels obliged to meet it in a mood or the rosiest idealism. Old servants, of the kind who dust the books as the curtain goes up, enliven the narrative with their highly conventional humor. Mrs. Denis bathes Katharine's forehead with "Ody Colone," and dubs an adopted gutter snipe Doris Gwendolin Patricia (the snipe, by the way, performs no function of any discernible kind, in the story), and converses alternately in stage Irish and after the manner of Pomona in "Rudder Grange." In short, Miss Kelly hardly shows the courage of her convictions. Imagining a really strong, if painful situation, instead of bravely and patiently unravelling it, she positively submerges it in sugary optimism. It should, however, be confessed that her method will undoubtedly give perfect satisfaction to those readers who look upon a novel as a mental form of sweetened pepsin.

The Heart of Hamlet's Mystery. Translated from the German of Karl Werder by Elizabeth Wilder, with an Introduction by W. J. Rolfe. New York: G. P. Putnam's Sons.

As a matter of general sentiment there are probably few persons who do not take for granted that in some manner or other the explanation of Hamlet's tragedy is to be found in Hamlet's own character. The prevalence of this view is due in part to the influence of its original promoters, Goethe and Coleridge; but it is due also to an instinctive appreciation of Shakespeare's general idea and practice of tragedy. Well rooted as it has come to be, however, it has not lacked assailants—to fasten it, if anything, even more securely by vigorous opposition. Of this opposition the leader seems to be the German professor, Karl Werder. In his lectures, delivered in Berlin during the winter of 1859-1860 and now tardily translated for the first time (as the translator explains, in consequence of the interest aroused by the citations in Furness's "Variorum"), Professor Werder undertakes to show, in opposition to the accepted interpretation, that the obstacles or difficulties in the way of Hamlet's action are not "subjective," as is usually assumed, but wholly "objective." As an explanation of the professor's idea of objective difficulties the following quotation will suffice.

> What is Hamlet to do? What is his actual task? . . . It is not to crush the King at once—he could commit no greater blunder—but to bring him to confession, to unmask and convict him. . . . As things stand, truth and justice can come to light only from one mouth, that of the crowned criminal, and if he . . . does not speak, then the truth will be for ever hidden. . . . Herein lie the terrors of this tragedy. The secret of the encoffined and unprovable crime is the unfathomable source out of which flows its power to awaken pity and fear.

Exactly. Such is Hamlet's character—that he should hesitate to avenge his father and even to secure his own safety for an ideal justice, a personal scruple, which a man like Othello would never have felt.

Aside from this—aside, that is, from the whole contention—the point is ingenious, as for that matter is the entire plea. At the same time it is only just to notice that Werder has confused his reasoning. Sometimes he reasons outside of the play and sometimes inside of it indifferently. So, for instance, he urges, in the way of an "objective" difficulty to any action on Hamlet's part, that it would have been impossible for the Prince to convince the Danish public of the justice of Claudius's death, were he to be killed off-hand at the suggestion of the ghost. But such a reason is purely external to the piece; it is legal or political, not dramatic. The Danish public is neither an actor nor a motive in the drama; and if need were, the poet might have justified such an act dramatically just as satisfactorily as he has carried off Lear's impossible repudiation of Cordelia. The fact is that it is a dramatic necessity that prevents Hamlet from killing the King, and not a political one, but this is the bane of scholastic criticism—to confuse the motives proper to life with those proper to drama, to reason about the stuff or fable of tragedy as though that were all there is to it. And Professor Werder himself has not escaped the infection.

Synthetica: being Meditations Epistemological and Ontological. By S. S. Laurie. 2 vols. New York: Longmans, Green & Co. $7 uet.

The first of these volumes contains nineteen meditations on knowledge; and the second, eighteen meditations on God and man. "The meditations of the second volume constituted, along with an introductory statement giving the argument of the first volume, the Gifford Lectures delivered in the University of Edinburgh in 1905 and 1906." The author tells us that he uses the term "meditations" to express the form of his work because it is substantially a dialogue with himself. Any random quotation, such as the following (vol. i., p. 279), fairly illustrates the general character of this dialogue:

> There are grades of mind. The attuitional synoptic single total given to percipience is broken up, in the dialectic effort to understand it, into parts (judgments of subject and predicates), but it is still a *synoptic* whole, with this difference that it is now to thought an aggregate of affirmed parts—a *mere* aggregate, however. This concipient synthesis (as we may now call the synopsis) consists of coutrary elements held together by *the mere force of Will.* The next moment of the Dialectic, however, gives the true rational synthesis in which the fused unity of the synopsis is metaphysically explained. The mechanical unity of sense-concipience with its collocated and colligated parts is now superseded. The dialectic as a one movement grips the unity, and it is now a *one.* The "How" of the fusion phenomenally is still beyond us; but reason is satisfied. Each "thing" is to be looked at as a "dialectic one" at first and at last. I am not entitled to stop short at any functioning act of the various moments of the dialectic, and then complain of contradictions.

Seven hundred pages of this personal dialogue, the greater part of which is no more generally intelligible than the quoted instance, cause us to wonder why it was not translated into communications to the reader before it was published. Dr. Laurie has, in our opinion, made a book which very few will have the courage or the patience to read.

One should, however, be willing to suffer much if illumination is to be one's reward. How far, then, we may ask, do these meditations clarify the problems of knowledge, and give us intelligible opinions about God and man? In answer we are forced to subscribe emphatically to the author's words at the end of his book: "With a profound sense of mystery we begin our thought on the ultimate of things, and with a still profounder sense of mystery we close it." We do not insist that philosophy should uot result in a profounder sense of mystery, but we do insist that with such a result the sense of mystery should be genuinely profound. It should not be merely another expression for intellectual confusion, for then philosophy has utterly failed.

Difficult in expression and intellectually confused as the work is, its general aim and method as well as its philosophical affiliations may yet be detected. Dr. Laurie attempts to exhibit the developmeut of knowledge from its rudimentary beginnings up to its culmination, where it seeks an "absolute synthesis" in the recognition that "All is One—must be One; and the last and highest is already immanent in the first and lowest." In the second volume this synthesis is religiously interpreted, and some of the characteristic problems of theology are discussed in the light of it. Dr. Laurie has thus increased in bulk the products of that modern philosophical tendency which seeks in a theory of knowledge a solution of philosophical problems and an interpretation of religious faith. We fail to discover, however, that he has increased its intelligibility or given it any new significance or justification.

A Staff Officer's Scrap-book During the Russo-Japanese War. By Sir Ian Hamiltou. Vol. II. New York: Longmans, Green & Co. $4 net.

This really brilliant book deserves a wide public, even though the present volume deals almost exclusively, and at great length, with military details. For the author belongs to that very small class of soldiers who add to an extensive technical equipment the knowledge that to conduct war is to play on the psychology of individuals and of masses, and to that even smaller class with whom the pen flashes as readily as the sword. Sir Ian is a wit, the best of comrades, fair to foe as to friend, willing to acknowledge a mistake or a weakness, and always a military critic of the first rank. No soldier can afford to

miss the book, while many civilians will get both profit and amusement from it.

Sir Ian is too much of a scholar and a thinker not to have a philosophy, and too brave a man to fear being out of fashion. He boldly preaches the doctrine that war is the school of all the virtues, and peace the breeding place of all the vices. Yet he saw such sights as 203 Metre Hill a few days after its capture by the Japanese:

At a glance it springs to the eyes that this is no ordinary hill. It has been fairly battered out of its shape by inhuman agencies, and on its blasted and shot-seared surface there is not so much as one dried blade of grass; nothing to break the harshness of the devil's ploughing to which it has been subjected, but here and there the faded color of a woman's gown or petticoat, which has been used to make sandbags, or the leprous yellow splotches left by the bursting of the high-explosive shells. The manner of the devil's ploughing is thus: first the hill has been sliced into numberless deep gashes, and then these trenches and their dividing walls have been smashed and pounded and crushed into a shapeless jumble of stones; rock splinters and fragments of shells cemented literally with human flesh and blood. A man's head sticking up out of the earth, or a leg, or an arm, or a piece of a man's body lying across my path, are sights which custom has enabled me to face without blanching. But here the corpses do not so much appear to be escaping from the ground as to be the ground itself. Everywhere there are bodies, or portions of bodies, flattened out and stamped into the surface of the earth, as if they formed part of it. . . . The very walls are built of alternate layers of frozen corpses and sandbags.

Let us turn from the horrible to the theoretical; here our author is equally at home. His discussion of the strategy of the converging march of the Japanese on Liao Yang can hardly be done justice to by quotation; all that can be noted is that the comparison with Von Moltke's march on Sadowa is of much interest, and the suggestions of a defence of the converging march based on the development of fire arms is tantalizing, because only hinted at, and not developed. Such a theory would place the question higher than Von der Golz did.

The unusual quality of the book, however, arises from the personality of the author, and it is on this note we must leave it. Just before the advance on Mukden, Sir Ian was recalled to England to command the troops at Salisbury plain. He and the other foreign attachés were entertained at a banquet before his departure, and here is the speech he pronounced on that occasion:

I felt almost overcome when I rose to reply. I said the King of England, in giving me my appointment, had probably been influenced by knowing I had enjoyed exceptional opportunities for studying my profession with the First Army. For it was first not only in its numeral. It had fought the first battle, first entered Manchuria, first crossed the Taitsuho. . . Thus, although His Excellency and his army were so modest that they did not know it, they were now the most popular military force in the world. If any of them went to London or New York they would be surprised at the warmth of their welcome. The only place in the world where they would henceforth be disliked was on Salisbury plain, for the troops there would so often hear of the virtues of the First Army that they would wish his Excellency Gen. Kuroki had never been born. I wound up, as far as I can remember, by inviting the whole 42,000 to come and stay with me in England as long as ever they liked.—It was very characteristic of Japanese tact, that when it came to the turn of the interpreter to translate my remarks he should have added to the towns of London and New York which I had actually mentioned, the names of Paris, Berlin, Vienna, Rome and Stockholm, which I had forgotten to include.

Freedom in the Church. By Alexander V. G. Allen. New York: The Macmillan Co. $1.50 net.

The clergyman of the Episcopal Church, Dr. A. S. Crapsey, who was recently condemned as a heretic in the diocese of Western New York, is not expressly mentioned in Professor Allen's defence of liberty within the confines of the Church, but it is unmistakable that the questions and difficulties arising from that heresy trial and its issue furnish the occasion for this volume. Not that Professor Allen confesses heresy on the doctrine of the Virgin birth: on the contrary, he writes:

It is accepted as the miraculous or supernatural mode by which God became incarnate in Christ, as the resurrection and the empty tomb mark the exodus of Christ from the world.

But although himself orthodox, he would find abundant freedom in the Church for men of the opposite opinion. His method of defence of liberty is historical. He has, of course, no difficulty in showing that in the mind of its framers the Apostles' Creed meant something very different from its usual interpretation to-day. The studies of Kattenbusch, McGiffert, and others on the Old Roman Symbol have made this entirely clear. In his historical study of the causes which led to the change of interpretation of Christianity's oldest creed, and the motives for increased emphasis on the miraculous birth, the author of "The Continuity of Christian Thought" again shows himself a fascinating interpreter of the movements of religious thought and a skilful advocate of his own interpretation.

In the question of morals involved in creed subscription, it may be questioned whether he is so successful. He rules out of court somewhat brusquely the judgment of ordinary mortals as to the propriety or impropriety of the use of the creed by one who does not assent to it as it is commonly understood, and declares that "the judgment of the 'man on the street' has no value, even though it find vigorous and severe expression in the utterances of the secular press." "Religion," we are told, "has its own laws, it is guided by deep motives, which only those interested or, as it were, obsessed by them can understand." The question would seem to be as to what function the reciter of the creed is supposed to fulfil. If he is a celebrant of mysteries, common judgment on the meaning of the offices he employs may be disregarded. If he be regarded as an historian or theologian, he may be allowed to quote ancient formularies in a sense known only to himself. But if the minister is a teacher, and, in reciting the creed, a leader in an intelligent act of worship, it is difficult to see how Professor Allen's claim of the privilege of employing the creed in an esoteric sense can be allowed.

As a tract for its times, however, this volume presents important considerations on a vital question, and the effort of the author to secure and establish freedom in the Church, as well as his endeavor to impart correct information as to the history of symbols now in controversy, should secure him wide sympathy.

Naturalism and Religion. By Dr. Rudolf Otto; translated by J. Arthur Thomson and Margaret R. Thomson; edited with an Introduction by the Rev. W. D. Morrison. New York: G. P. Putnam's Sons. $1.50.

The Religious Conception of the World. By Arthur Kenyon Rogers. New York: The Macmillan Co. $1.50 net.

A few years ago theologians of a certain school were saying confidently that religious doctrine could dispense entirely with metaphysics, and that faith could pursue untrammelled her even way in total unconcern as to what view of the world philosophy might establish. That such a position could not be permanent was evident to all thoughtful observers; and the vigorous essay of Professor Otto, who is in the spiritual succession of the followers of Ritschl, may be taken as evidence that a decided reaction is well under way. The German title of his work, "Naturalistische und religiöse Weltansicht," indicates his intention to set in positive contrast the naturalistic and religious interpretation of the world, and his treatise as a whole is an earnest endeavor to establish the validity of the religious view as against the counter-claims of naturalism. The notion that the spiritual is a mere accompaniment of the physical he cannot tolerate, and against all forms of sensualism, empiricism, and parallelism he asserts the creative activity of the spirit. He defends a view of the world in which there is room for the sense of mystery, the feeling of dependence, and belief in purpose, which are the three essentials of religious faith. In establishing this view, he considers at length, and with commendable fairness and thoroughness, the opinions of leading naturalists, both English and German, down to the most recent, and he shows himself at home in the discussion of scientific theories to a degree unfortunately rare in theologians. In the course of his argument, which he pursues with enthusiasm as well as with logical force, he brings to the fore important considerations which recent apologetes have been inclined to neglect; and both his work and that of Professor Rogers, which follows independently somewhat similar lines, will doubtless help to win back for the defenders of the spiritual some of the territory which they had relinquished too readily and with too little appreciation of its value and importance.

The Lombard Communes: A History of the Republics of North Italy. By W. F. Butler. Imported by Charles Scribner's Sons, New York. $3.75 net.

Professor Butler writes easily and well; he has thoroughly mastered his subject, and he possesses the rare art of adequate condensation. But, while heartily commending his industry, accuracy, and general level of attainment, we may fairly warn the reader that his treatment is such as is ordinarily characterized by the term

"popular." In other words, he has written for the general public rather than for the student. His Bibliography, which he modestly entitles "A rough list of books useful for the study of the history of the Lombard Communes," contains a bare score of well-known volumes—Cantù, Sismondi, Hegel, Leo, Ferrari, Von Raumer, and the like—while some of them (*e. g.*, Symonds's "The Renaissance in Italy" and Villari's "I Primi due Secoli della Storia di Firenze") have, at best, only an indirect bearing on the topic. Possibly a dozen other books are mentioned in the footnotes, but usually without specifying either the publisher or the date. As we learn from the preface, Professor Butler's work is largely based upon the "Storia de' Comuni Italiani" of Francesco Lanzani, an excellent book, but hardly up to date (it was published just a quarter of a century ago). Although our author has doubtless acquainted himself with the results of more recent research, he fails to give his readers the full benefit of his knowledge. Surely, such periodicals as the *Archivio Storico Lombardo* and the *Bollettino della Società Pavese di Storia Patria* deserve a place in even the most meagre list of books dealing with the Lombard Republics.

All this, however, is no reflection on Professor Butler's competence for his task. It simply means that he has chosen to write for that class to whom a citation is anathema and a foot-note an eyesore. Of actual mistakes we have found scarcely one. We may object that "parish" is hardly an adequate translation of *pieve*, and we may demur to the statement that "one can still see in Perugia the fragments of the chains carried off from Siena" (p. 224). (The chains in question were removed by the Aretines in 1799). But, when all is said and done, we have rarely seen a better book written by an Englishman about Italy.

Science.

Haeckel: His Life and Work. By Wilhelm Bölsche; with Introduction and supplementary Chapter by the Translator, Joseph McCabe. Illustrated.. Philadelphia: George W. Jacobs & Co. $4.

This is an unusually successful work in a difficult field. The hardest kind of biography to write is the life of a scientific man, because it is ordinarily lacking in dramatic action, and its triumphs are in a field so remote from common life that the average reader can hardly be made to understand them, still less to appreciate their significance. Professor Bölsche is not ashamed to explain things; and therefore the layman, who has only a vague conception of radiolaria and who does not know so much about Darwinism as he thinks he does, will be able to read the whole volume with comprehension, and even to share largely in the author's biological enthusiasm. His unstinted devotion to his master prevents him from being critical, and his Teutonic sentimentality will sometimes amuse the reader, but he certainly tells clearly what Haeckel has done, and how he did it. Most biographies contain an excess of trivial detail; this one does not contain enough of Haeckel's private life and idiosyncrasies to give us a vivid picture of his personality. So, while we must give credit to the author for teaching us a great deal of zoölogy in a pleasant manner, the most difficult part of his task, he has hardly done justice to an exceptionally interesting individuality.

Haeckel's work is far from being what one of our modern humanists defined as the ideal of scholarship—"the passionless pursuit of passionless intelligence." Nor has he followed the Baconian method of patiently accumulating miscellaneous facts, meanwhile restraining himself from anticipatory conjecture. Prof. William James came nearer defining the Haeckel type when he said that the successful investigator is one who has an intense desire to prove himself right, coupled with an equally intense fear lest he should be wrong. Haeckel has done an exceptionally large amount of unimpeachable descriptive work, involving the severest kind of scientific drudgery—forty-two volumes, many of them quartos, comprising 13,000 pages, not counting journal papers, in thirty-three years. Yet he is chiefly known to the world at large by his bold hypotheses, projected far in advance of the evidence supporting them. As early as 1866, five years before the cautious Darwin had ventured to publish in "The Descent of Man" some of the logical consequences of his "Origin of Species," Haeckel had constructed a comprehensive genealogical tree of the animal and vegetable kingdoms, guessing at all the missing links, and even endeavoring to fill the gulf between living and inorganic matter by adding a lower kingdom of "protists" and arguing for the life of crystals; and during the forty years since he has unceasingly preached his gospel of monism to both the scientific and the outside world. Haeckel is commonly called the apostle of Darwinism, but it would perhaps be more appropriate to say he is the apostle of Goetheism, for it was from Goethe that he received the aspiration toward a unifying philosophy, to which the discoveries of Darwin gave an experimental basis. His monumental work, "The General Morphology of Organisms," owes more than its title to Goethe; and it is not by accident that Ernst Haeckel Street in Jena passes close by the stone seat where Goethe and Schiller used to discuss the "Riddles of the Universe."

Professor Bölsche's biographical sketch closed in 1900; but since then Haeckel has become more widely known than before through the popularity of "Die Welträthsel," which sold by the hundred thousand, and has been translated into fourteen languages. It called forth a library of replies, most of them in very hot temper, aroused, perhaps, less by what the book contained than by the jaunty air with which Haeckel decides in a few pages questions that metaphysicians, theologians, sociologists, and natural philosophers have been discussing for centuries without coming to any conclusion. As a reply to the five thousand personal letters which he received about the "Riddle of the Universe," he dashed off during a vacation visit to the Riviera on the occasion of his seventieth birthday a similar book, "The Wonders of Life," equally provocative and discursive. The story of these latest years, and of the crowning honor of lecturing on evolution in Berlin, the stronghold of the recreant Virchow, is well told by the translator.

The *Geographical Journal* for April opens with a description of the physical geography and geology of northeastern Rhodesia, with a map and illustrations, by L. A. Wallace, chief surveyor of the British South Africa Company. Among the interesting facts given is the existence of a large tract of land with rich cotton soil. The natives have always grown cotton, and now the company has experimental plantations on which foreign and native cotton seeds have been tried with great success. The great irrigation projects of our own country, with their geographical and economical results, are described in detail by Major J. H. Beacom, military attaché to the United States embassy, with illustrations and sketch-maps. In the interesting discussion which followed the reading of the paper before the Royal Geographical Society, eminent engineers gave accounts of irrigation works in India and Egypt. Col Church called attention to the fact that the ancient Peruvians irrigated millions of acres. A new island thrown up by the action of a mud volcano in the Bay of Bengal, on December 15, 1906, is described by Lieut. E. J. Headlam. It is 307 yards long by 217 yards wide and 19 feet above high-water mark, and the temperature sixteen days after the eruption, three feet six inches below the surface, was 148° Fahrenheit. Fifteen varieties of seeds and pods which had been blown, washed up, or deposited by birds were found there, an indication of how short a time it would take for vegetation to grow on a new-born island in the tropics. The Founders' Medal of the society has been awarded to Dr. F. Moreno, a distinguished Argentine explorer, and the Patrons' Medal to Capt. R. Amundsen, who recently completed the Northwest Passage for the first time in a ship.

The *National Geographic Magazine* for April has for its opening article an interesting account, with numerous illustrations, of the work of our Reclamation Service, by its statistician, C. J. Blanchard. In the four years of its existence, ending the first of last January, it has dug 1,267 miles of canals, built 467 miles of roads, while on the irrigated land eight towns have sprung up and homes in the desert have been provided for 10,000 people. At present it is engaged upon twenty-five irrigation projects, with a force of 10,000 workmen, including several hundred Indians, at an expenditure of about one million dollars a month. The fallacy of the popular belief that the Salton Sea is responsible for the heavy rains of the last two years in the West is shown by Prof. A. J. Henry of the Weather Bureau. In some notes on Central America are many encouraging facts and statistics in regard to the various States, with the exception of Honduras. A very interesting series of pictures of women and children in the East, collected by Miss E. R. Scidmore, enable one to see something of the personal side of the Eastern peoples.

The American Philosophical Society held a general meeting in Philadelphia, April 18 to 20. The Hon. James Bryce was present, made an address, and presented the gold medal of the Royal Astronomical Society to Prof. E. W. Brown of Haverford.

The following papers were presented: "Retardation in Mental and Moral Development," Dr. Lightner Witmer; "Analogies between the Colonization of Ireland and of Virginia," Prof. Edward P. Cheyney; "Elizabethan and Jacobean College Dramas," Prof. Felix E. Schelling; "The Narratives of the 'Walking on the Sea,'" Prof. William A. Lamberton; "Early French Members of the American Philosophical Society," Dr. J. G. Rosengarten; "The Liver as the Seat of the Soul," Prof. Morris Jastrow, jr.; "Charts Illustrating the Taxonomic Relations of the Monocotyledonous and Dicotyledonous Plant Families," Prof. John W. Harshberger; "Some Experiments with Plant Nutrients," Prof. Henry Kraemer; "New Results in Electro-Analysis," Prof. Edgar F. Smith; "On the Transportation Crisis," Prof. Lewis M. Haupt, all of Philadelphia; "The Influence of Imperceptible Shadows on the Judgment of Distance," Prof. Edward B. Titchener and W. H. Pyle of Ithaca; "Chauvin (Chauvinisme-Calvin, *Cauvin*): Truth and Fiction in the Story of Its Origin," Prof. A. Marshall Elliott; "On Jonah's Whale," Prof. Paul Haupt, Baltimore; "Provisional Report of the Investigation of Foreign and Domestic Stage Micrometers," Dr. Marshall D. Ewell, Chicago; "The Bacteriology of Flax Retting,' Dr. George T. Moore, West Chester, Pa.; "Note as to the Measurement of the Action of Water upon Zinc and Lead," Dr. William Pitt Mason, Troy; "The Production of Synthetic Alcohol," Dr. Harvey W. Wiley and Herman Schreiber; "On Continental Development," Bailey Willis, Washington; "Progress of the Isthmian Canal," Dr. Elihu Thomson, Swampscott, Mass.; "Princeton Archæological Expedition to Syria," Howard Crosby Butler; "The Association Theory of Solutions," Prof. William F. Magie; "South Africa: Geography and Geology," and "Restorations of Santa Cruz Animals," Prof. William B. Scott; "Santa Cruz Typotheria," W. J. Sinclair; "Santa Cruz Birds," Marcus S. Farr, Princeton; "The Groups which are Generated by two Operators of Order Two and Four, Respectively, where Commutator is of Order Two," Prof. G. A. Miller, Urbana, Ill.; "South Africa: Scenery and People," Prof. Ernest W. Brown, Haverford; "On the Temperature, Secular Cooling and Contraction of the Earth, and on the Theory of Earthquakes held by the Ancients," Dr. T. J. J. See, U. S. Naval Observatory, Mare Island, Cal.

The National Academy of Sciences held its spring session in Washington last week. President Ira Remsen of Johns Hopkins was elected president in succession to Prof. Alexander Agassiz, who retires after five years of service; Charles D. Walcott, secretary of the Smithsonian Institution, was chosen vice-president to succeed Dr. Remsen; Arnold Hague of Washington was reëlected secretary. The members of the council are Prof. Henry Fairfield Osborn of the American Museum of Natural History; George E. Hale of Mount Wilson Observatory, California; Prof. Alexander Agassiz of Cambridge; President R. S. Woodward of the Carnegie Institution, Washington; Dr. W. H. Welch of Baltimore; and Prof. R. H. Chittenden of the Sheffield Scientific School. Sir James Dewar, professor of chemistry in the Royal Institute, London; Prof. A. R. Forsyth, mathematician, of Cambridge, England; Prof. David Hilbert, mathematician, of Göttingen; and Prof. J. C. Kapteyn, astronomer, Groningen, Holland, were elected foreign associate members.

On May 28, 1807, Louis Agassiz was born in the parsonage of Motier, Switzerland. The Natural Science Associations of the cantons of Vaud, Freiburg, and Neuenburg, have decided conjointly to celebrate the anniversary of this event in a somewhat elaborate scale.

A monument to the memory of the great geographer August Petermann, the founder of the *Mitteilungen*, is to be erected in the Grand Duke's Park in Gotha, which city was the scene of his greatest work. He is the real founder of the modern science of geography in Germany.

Franz Reinhold Kjellman, professor of botany at Upsala University, died last Monday. He was born in 1846, on the Island of Bromë, in the Swedish Lake of Wener. He studied at Upsala, in 1868, and after accompanying several polar expeditions he became a professor at Upsala, in 1883. He wrote the account of the Swedish polar expedition of 1872 to 1873, and prepared an account of the flora—the seaweeds, etc.—of polar regions.

Drama.

Dodd, Mead & Co. have issued in one volume of 277 pages, a reprint of Alexander Teixeira de Mattos's translation of Maurice Maeterlinck's "Joyzelle," together with Alfred Sutro's acting version of "Monna Vanna." The two plays, dealing with the subtlest aspects of love, are well contrasted. The influence of Shakespeare may be detected in "Joyzelle." Merlin is Prospero; and Arielle, though definitely explained as the old man's "inner force, the neglected power which slumbers in every soul," performs the same tricksy feats as the Ariel of "The Tempest." The play is wholly symbolical, and love, the rare love which Merlin declares occurs not more than once in centuries, suffers and meets even the uttermost test, and is victorious. In "Monna Vanna" love is again subjected to the test—twice subjected. Guido, the husband, fails to meet it; Prinzivalle rises to the level of greatness, and wins the respect and love which the husband by faith might have retained. All this delicate, subtle, elusive, almost illusive vision of love, is expressed by Maeterlinck in language haunting in its exquisite beauty, and impossible to transfer to another tongue. Mr. Sutro disclaims attempt at literalness. Both versions show roughnesses (such as the constant use of "as though" for "as if") which might be eliminated; but for those unable to read the originals, the beauty of the plays themselves will be unspoiled even by imperfections.

Arthur Golding is popularly known only as the author of the translation of Ovid, from which Shakespeare drew most of his mythological lore. He was, in fact, one of the most voluminous and able translators of the Elizabethan age, and we are glad to see his "Tragedie of Abrahams Sacrifice," edited by Dr. Malcolm W. Wallace and reprinted (for the first time) in the handsome series of the University of Toronto Library. "Abraham Sacrifiant," the only play written by Beza, the eminent Swiss reformer and scholar, was published at Geneva in 1550. Golding, in 1575, made a close, almost line for line, rendering of the play into English, and published his work in 1577. The single copy of the book now known to exist is in the Bodleian Library, and Dr. Wallace's present edition is (presumably) an exact transcription, with Introduction and Notes and with a reprint of the French text. The woodcuts in the English volume (they are not in the French editions of Beza) are admirably reproduced in half-tones. Dr. Wallace might be charged, possibly, with the common error of annotating where annotation seems scarcely necessary, as, for instance, in his explanation of the word "plight," meaning "state" or "condition," but in general his work shows commendable common-sense. The tragedy itself is simple and quaint—nothing more, although to Pasquier, a contemporary, it "fit tomber les larmes des yeux," and to Émile Faguet to-day it seems "forte, bien conduite et touchante."

Heinrich Conried has withdrawn from the management of the Irving Place Theatre and has been succeeded by Dr. M. Baumfeld. In a statement of his plans he says that the programme will be changed almost daily. Even the most successful pieces will not be allowed to monopolize the stage. He promises to organize an entirely new and competent stock company, capable of interpreting all the varieties of drama, old and new, domestic and foreign, including the latest products of French, Italian, Spanish, and Scandinavian playwrights. Especial attention, he promises, shall be given to the revival of classic works, such as "Wallenstein," "Emilia Galotti," "Macbeth," "As You Like It," "Der Richter von Zalamea," etc. Nor will the claims of light comedy be neglected. His season will open in October, and Thursday nights are to be devoted to "special literary productions of the modern international type." In other words, Dr. Baumfeld professes the ambition to restore the German theatre in this city to the position which it occupied some years ago, or to put it on a still higher plane. As the manager of a German theatre he will be exempt from one difficulty with which an English-speaking manager would be confronted: his actors will not be exposed to the temptation of offers from rival theatres or combinations. The chief obstacle in his path to commercial as well as artistic success will be the notorious disinclination of the younger generation of German citizens to support a German theatre.

Signor Ermete Novelli expects to return to this country next November. Two of the most important pieces which he purposes to present are the "Nero" of Signor Ceoso and "Macbeth." In the former he has, so it is reported, won triumphs both at home and abroad, but he has never yet attempted Macbeth.

Beginning Monday night, April 29, Robert Mantell will offer some of Shakespeare's plays at the New Amsterdam Theatre. "Julius Cæsar" will be given Monday, Tuesday, and Wednesday nights, and Saturday afternoon; "Richard III.," Thursday and Friday nights; "Macbeth" Saturday night; and

"Merchant of Venice" Wednesday afternoon. The plays for the second week are "King Lear" and "Othello," and Lytton's "Richelieu."

Marlowe's "Dr. Faustus" is to he given at Princeton, April 26, hy students of the university. The play was acted by students of Heidelberg two years ago, and in 1904 by the Elizabethan Stage Society in London, and elsewhere, but this, we believe, will be its first presentation in America. The text of 1605 is followed, with scarcely any ehanges either of omission or transposition.

The retirement from the Russian stage, after thirty-seven years of active work, of the tragic actress, Mme. Ermolova, resulted in a great demonstration in her honor. The artistic world of Moscow gathered at the Literary and Artists' Cluh to give her a farewell hanquet, and she was the recipient of innumerable addresses from public and private societies. Much regret was expressed that her career should have been interrupted by ill-health at an age when her artistic powers are still in their prime. Mme. Ermolova created, at the Moscow Imperial Theatre, many Schiller parts, and was an especial favorite in Shakespeare. She played almost the entire series of Shakespeare heroines, Juliet, Hermione, Desdemona, Ophelia, and Lady Macbeth being reckoned among her best achievements.

Music.

Personal Recollections of Johannes Brahms. By Georg Henschel. Boston: Richard G. Badger.

Biography does not always confirm the maxim that the style is the man. No one would ever guess from Beethoven's music what an unpolished, rude, untidy person he was. Nor would any one familiar with the austere, dignified compositions of Brahms suspect that one of the main traits of his character was humor, or rather, wit. Georg Henschel has preserved a number of his witty remarks, which usually assume the form of malicious jokes. One day, when Henschel had spoken disparagingly of certain poor compositions by a member of the highest aristocracy, Brahms retorted: "My dear Henschel, let me warn you to be more cautious when speaking of a nobleman's compositions, for you can never know who did 'em!" On another occasion, when a rather well-known composer had asked Brahms's permission to play for him his latest composition, Brahms, after the man had finished, took a sheet of the manuscript between his thumh and middle-finger, and exclaimed: "I say, where do you get your music paper? First rate!" Six years hefore his death he wrote Henschel the following nonsense letter, made up of Italian expression marks: "Menuetto grazioso da capo e poi lo stesso con variazioni elegantissimi ed ancora dal segno e da capo col repetizione, etc. Cordiali saluti." Only this, and nothing more!

It would also be difficult to find in the music of Brahms traits corresponding to his actions when on a vacation. "We had our swim in the sea together," writes Henschel, "and again found much amusement in diving for little red pebbles." Another time Brahms piloted Henschel to a bullfrog pond he had discovered: "Then we leaned over the pond, caught tiny little hahy frogs, and let them jump into the water again from a stone, which greatly amused Brahms." In such intimate hours the master seemed to permit his enthusiastic young friend a deeper insight into the workings of his mind than he allowed the rest of the world, "against which he appeared to he fortified with the *aes triplex* of irony, sarcasm, and indifference."

Henschel first met Brahms in 1874, and saw him the last time on his deathbed in 1897. For a time he saw him frequently, and was sensible enough to keep a diary in which he jotted down some of his friend's wit and wisdom. Being a composer himself, in a modest way, beside an orchestral conductor and a singer, he profited frequently hy his friend's words. In regard to some of his songs, "You seem to me too easily satisfied," said Brahms. "One ought never to forget that by actually perfecting *one* piece one gains and learns more than by commencing or half-finishing a dozen." "In writing songs you must endeavor to invent simultaneously with the melody, a healthy, powerful bass. You stick too much to the middle parts." "No heavy dissonances on the unaccentuated parts of the har, please! That is weak." There is no real creating, Brahms held, without hard work. He thoroughly believed in unconscious cerebration. After conceiving the first phrase of a song —perhaps only half a dozen notes—he could go for a week, and perhaps not think of it again for months. Then, on returning to it, he found it had taken shape.

New light is thrown by Mr. Henschel on the vexed question as to what Brahms really thought of Wagner. Evidently his feelings were undecided and vacillating. One day, with a malicious twinkle in his eye, he read to his guests the manuscript of Wagner's amazing letters to his dressmaker, which he had bought at an auction sale. He hailed the Bayreuth Theatre as a national affair, but never attended any of the festivals, partly because they came in midsummer, when he was resting. He confessed he liked "Walküre" and "Götterdämmerung," but cared less for "Rheingold" and "Siegfried." In place of the mythical Siegfried he would have preferred "young Bonaparte, or some other hero who stands nearer to our sensibilities." It is well known that Brahms was not averse to borrowing themes from Wagner and other composers. On page 33 a conversation is reported in which he said that he had incorporated in one of his songs a charming motive by Scarlatti, and wished there was a way of acknowledging his indebtedness. Henschel suggested that he should simply print Scarlatti's name at the end of the phrase in question, and this was done (opus 72, No. 5).

Considering that Brahms once wrote: "With me the moment is still to come when I shall write the first letter *with pleasure*," Mr. Henschel was lucky in getting twenty-one letters from him in eighteen years. These are printed in the present volume. They are of less interest than the diary, hut one sentence of far-reaching importance may be cited from one of them: "As far at least as my experience goes, everybody has, sooner or later, withdrawn his metronome marks."

Art.

THE UFFIZI IN TRANSITION.

FLORENCE, March 27.

The tourists who are Baedekerizing through the Uffizi are having a hard time. Hardly anything corresponds to the book, except the Trihuna, so that the ingenuous visitor is seeing his Botticelli *sans le savoir*, or only by virtue of the label. The changes that have been in progress for ten years and more have been accelerated this season by the transfer of the Venetian pictures to the newly opened galleries near the entrance; and while the arrangement is wholly a provisional one, the reform has gone far enough to reveal the spirit in which it is undertaken, and to forecast the gain and loss. It should be noted, too, that the spectacle of a museum in transition for many years is in itself a rare and instructive one. Generally there is a closing of the doors for a month or so, and then *presto!* change, so far as the public is concerned. But the Uffizi cannot close its doors, both for the humane reason that thousands have come from the ends of the earth to see it, and for the more practical motive that to shut up shop means an appreciahle loss of revenue. Hence the stages of its housekeeping are seen of men. To every one concerned with museum polity they are of interest, quite aside from the special concern of every art lover in the Uffizi.

Now the changes, whether made by Corrado Ricci or by his disciples, who are now in charge, have in the main been due not to choice, but to necessity. They do not represent, as so often, the desire to signalize a new régime, or to illustrate a new theory. One may like them or not; one must admit at least that something had to be done. When the pictures at Santa Maria Nuova were removed to the Uffizi, an already crowded gallery was forced to provide two additional exhihition halls. Then very interesting maps in fresco were found under the hangings of the Third Tuscan Hall. To show these it was necessary to move all the pictures, including such treasures as the two Botticelli *tondi*, the Filippi Lippi, and the Annunciation, attributed to Leonardo. The room itself has become a sort of resting-place, a much-needed feature in so large a museum, containing only the Montefeltro portraits by Piero della Francesca and the curious box adorned with the triumphs of Petrarch—of its old contents, hesides one or two of the newer acquisitions on easels. Meanwhile pictures had been bought or promoted from the store-room, enough to fill another gallery. In all, then, four new halls had to be found. Fortunately, there existed an unused and almost unknown suite between the entrance and the Tuscan School. It consisted of three large galleries and three cabinets, all capitally lighted, and a long hall in which the light was fair. The obvious superiority of this series of galleries to the familiar halls emboldened the authorities to move the pictures of the Venetian school out of their cramped quarters, and to undertake a considerahle rearrangement of the new and displaced pictures of the Tuscan school. One may regret perhaps that the Hall of Lorenzo Monaco was included in the plan, for it was a haven of rest, a refuge from

the harried tourist, and its three capital pictures, Lorenzo Monaco's masterpiece, and Botticelli's Adoration of the Kings and Birth of Venus, were seen there almost ideally. A far wiser change was the removal of the portraits of painters to the floor below. They were always *hors d'œuvre* in the old position, and got only the dregs of one's atention.

The changes, viewed in their broader aspect, have brought about a notable concentration of scattered exhibits. From the first landing one may conveniently visit the four new halls of portraits of painters, and gape if he will at John S. Sargent's superficially emphatic and graceless presentment of himself, the newest acquisition. At the entrance above, one will find before reaching the Tribuna practically all the pictures of importance of the Italian schools. The first corridor has given up several of its best pieces. This will seem a grievance to many, but it is after all a sentimental regret, for the light there is execrable, and the throng confusing. Enough of the old favorites—Simone Memmi's Annunciation, Lorenzo Monaco's Adoration of the Magi, and the early Giottesque pieces—have been left to make a veteran still feel at home. Beyond the first corridor there is now little of graphic consequence, except the beautiful new room devoted to the early Flemings, and, of course, the drawings, which remain as always at the far end. Evidently the visitor has been saved many steps, and is spared the baffling and miscellaneous appeal of the old galleries along the third corridor. This concentration of the finest pictures seems then to be a reform worthy of perpetuation, though presumably the mere growth of the Tuscan school may eventually relegate the Venetians to their old locality.

Before discussing the new galleries which now contain the bulk of the *Quattrocentisti* and the Venetians, we should consider the general decorative aspect of the rooms. The authorities have been wise enough not to imitate the palatial fittings of the older galleries. These new halls have merely coffered cypress ceilings in the natural color and low walnut baseboards, with a pavement of large bricks which have an excellent tone and texture. The walls are kalsomined in a slaty green, upon which panels with old gold have great value, or in several shades of terra-cotta, of which one that is reddish and one that has a bluish suggestion are effective, while a lifeless chocolate brown, more rarely used, is always either neutral or positively ugly. In general, one may commend the simple good taste of the installation. It is in keeping with the newer ideas of museum display, but it took some originality and courage to adopt these ideas in the Uffizi with the ultra-palatial Pitti only a furlong away.

As for the new halls, it would be unfair to dwell upon the arrangement of the two Venetian galleries, which is frankly temporary. It has brought us at least such a collocation as the row of early Venetians that supports the central group of three Giorgiones—the Knight of Malta, the Infant Moses, and the Judgment of Solomon. Here are also Giambellino's idyllic Sacra Conversazione, restored to him after the squabbles of the critics; Mantegna's marvellous triptych; not to mention Carpaccio, Bissolo, Cima, Licinio, and Bartolommeo Vivarini. The row affords more keen and purely pictorial impressions than can be gathered within equal space in the museum. Opposite is a radient spot, where Guardi, Canaletto, Bernardo Bellotto, and Sebastiano Ricci, flank a *plafond* and a smaller fragment by Tiepolo. These are mostly admirable new purchases, and they remind us impressively how little genuine aerial quality and luminosity in the major key depend upon the niggling technic of the modern impressionists.

In the largest of the new Tuscan Halls one may best note the merits of the rearrangement. Here are two Baldovinettis and two crucifixes by Lorenzo Monaco ideally placed against the sage green plaster. Vechietta, a recent acquisition, affords an even more precious spot in a fine triptych. The large Crucifixion by Andrea del Castagno, the battered Last Judgment by Fra Bartolommeo, and the pencil copy that is necessary to its comprehension, and a number of Soglianis are merely in storage. But in the beautiful accord of the panels by Baldovinetti, Orcagna, and Vecchietta with the background, and in the simple and pleasing proportions of the hall, one may glimpse a splendid gallery that is to be. The next room is, in spite of its sombre and unsympathetic plaster, far the handsomest of the experimental gallerics. The end walls are occupied by those old vis-a-vis: Lorenzo Monaco's lovely Adoration of the Virgin, and Fra Angelico's sadly over-rated tabernacle for the Arte di Lana. To right and left of the entrance door are polyptychs by Gentile da Fabriano and Giovanni di Paolo of Siena—both consummate and gorgeous examples of tempera technic, of cunning glazing of tints over gold. It was a sound æsthetic feeling that gave as pendants to these on the opposite wall, a Bicci di Lorenzo and a nondescript Florentine triptych, both of kindred decorative quality with the major pieces, though far less significant as art. On an easel stands the Coronation of the Virgin by Fra Angelico. The room is a joy; and one should note the good sense that has included the two splendid examples of the Sienese and Romagna schools, instead of relegating them to especial local categories, where they would be less effective.

With the three small cabinets that are named after Botticelli, Leonardo, and Michelangelo doubts begin to intrude. Gain and loss are blended perplexingly. One must admit that the Birth of Venus is well seen, but is there any real gain justifying the abandonment of its old shrine? It is an advantage to have the two great *tondi* hung so that the superiority of the Madonna with Six Angels to its more popular mate becomes apparent even to a careless eye. But what a shock to find that magnificent bit of realism, the Adoration of the Kings, cheapened by the proximity of the two idealistic round pictures! To find the Calumny effaced by the horribly repainted Adoration of the Kings, which should have stayed in the store room! To enjoy such little masterpieces as the St. Jerome and the Judith only by a painful effort of abstraction! What inert company, too, the three Virtues of the Pollaiuoli are for their more sensitive neighbors! From the point of view of art history this room has its obvious justification, from that of pleasure one could heartily wish it undone, or, at least, the smaller and miniature-like masterpieces removed to a place where their individual excellence might be readily perceived.

It is such a delight merely to see Leonardo's noble Adoration of the Magi, that one must forgive much in the new Sala Leonardo. In the old Scuola Toscana its company killed it. Now it has been cleaned and put in a perfect light, and one may study, if only in the master's intention, what was to have been, and, in a way, still is, the consummate religious picture of the early Renaissance. But alas it has been taken out of a beautiful old frame and for greater pomp installed in a hideous gold and walnut contraption of the modern cabinetmaker. Other experimentalists and precursors are present: Uccello's battle piece, as ever grotesquely and finely decorative; Domenico Veneziano's triptych, shrilly out of key; Lorenzo di Credi's charming Venus; three more of the tiresome Virtues of the worthy Pollaiuoli; Cosimo Rosselli's Adoration of the Magi, artistically a void; and that enigmatic and terribly damaged Annunciation, some portion of which Leonardo surely painted, notably the landscape which has not suffered much. As an ensemble the room is displeasing, but one will hardly cavil at any experiment that gives such salience to the finest of Leonardo's early works.

Much the same comment applies to the Sala Michelangelo, where the round Holy Family, which, like everything else, was unfavorably placed in the Tribuna, now gives its full effect of a serene nobility more classic than that of the later works. Art history requires that it be accompanied by three peculiarly unprepossessing (two adulterated) examples of Signorelli; by Ghirlandaio's magnificent portrait of a Turkish rug (the finest before Gérôme)—there are also a Virgin and Saints; by a tolerable Mainardi; and an uninspired Antonio Pollaiuolo. It should be noted that the unharmonious character of the Leonardo and the Michelangelo room is due to the partial adoption of a genealogical principle of exhibition. The aim is to show a succession of masters leading up to their supreme pupil, who is further magnified by the presence of his fellow-students. Such a plan, I believe, will almost invariably lead to unattractive galleries. It is a sound instinct that keeps works of a period together, but within this limitation it seems as if there should be wide discretion to illustrate real, that is, æsthetic, affinities. We have seen that Lorenzo Monaco, Fra Angelico, Gentile da Fabriano, and Giovanni di Paolo can live together, whereas, Cosimo Rosselli, Ghirlandaio, and Leonardo cannot. Is it not the very purpose of museums to make these subtler affinities apparent, leaving genealogy to its proper vehicle the printed book, or at least limiting it to schools in which the illustration of artistic parentèle constitutes a beautiful display?

No gallery that contained the great triptych that Hugo van der Goes painted for the Hospital Church of Santa Maria Nuova could lack distinction. And aside from its finest exhibit the little gallery in the Third Corridor, which is devoted to the early Flemish schools, is highly attractive. Van der Weyden, Gerard David, Memling, and his imitators are arranged

on three walls, as a sort of confirmation of the impression of the Van der Goes. Two windows are covered by faded tapestries, which fall to the floor. It is the most restful hall in the museum, a place where one would willingly sit and wait for a more serene vision than is generally vouchsafed in museums. Possibly these Flemish pictures, which so narrowly shave the gulf of mere literal representation, have a peculiar value in a gallery devoted to the highly abstract art of the Tuscan school. They show us how much success or failure in art is a matter of hair-breadths, and they give a wholesome reminder that the pitfall for the artist is not literal representation, but that ignoble or indifferent vision that from the first observation to the last touch of the brush cheapens the thing seen.

Of the large hall devoted to later Flemish painting, and containing Rubens, Van Dyck, Porbus, and Sustermans, there is not much to say, except that the ensemble is unpleasing, and that the great Rubenses of the Henry IV. series have been degraded by some recent repainting to mere shabby ghosts of themselves.

Space forbids anything like an analysis of the older halls, as affected by these changes. Suffice it to say that the old Tuscan School has gained a certain unity through the loss of its masterpiece, the Leonardo, and by gaining Piero di Cosimo's Assumption; but the eclectics are still sadly in the way. Why do storerooms exist if not to preserve the efforts of the Lamis, Vanninis, and Bilivertis? It would be futile to discuss that old eyesore, the Tribuna, possibly the worst lighted and most ill-arranged exhibition hall of importance on the Continent. Still, it has been consecrated by many generations of guide books and gabblers about art, and I presume no director can be expected to have the courage to lay hand upon this venerable disorder. No one who has had the good fortune to see any of these pictures removed for copying purposes can have failed to note how ill seen they were before in what Mr. Baedeker, with appropriate rhetoric, has characterized as a "magnificent collection of masterpieces." In the four little cabinets that follow the Tribuna remains that ancient hodgepodge, Italian, German, French, Dutch, and Flemish, which will some day tax the ingenuity of a reforming administration. When that hour strikes, all lovers of this great museum will hope that its tradition may be respected. The Uffizi has never tried to exemplify the history of art. For four hundred years its collections have been based, not on erudition, but on taste. It has upheld an ideal which needs merely to be accentuated and perfected, the abandonment of which would be a positive misfortune. M.

There is an unwonted modernity about the April *Burlington*. One of the leading articles is on "The Case for Modern Art," by "A Modern Painter," and another is on "The Modern House and the Modern Picture"; while the departments of Art in Germany and Art in America are devoted largely to accounts of modern exhibitions —in the latter case to the one hundred and second exhibition of the Pennsylvania Academy. Even the older art dealt with in the number is not so very old, Hals, Velasquez, Hokusai, and Copley being the principal painters discussed, while the Slip Decorated Dishes of Chirk Castle date from the eighteenth century. "The Case for Modern Art" is illustrated by four plates from paintings by C. H. Shannon, William Nicholson, and J. J. Shannon, and a drawing by A. E. John—all of them of the younger generation of British painters, and all but J. J. Shannon comparatively unknown in this country. In the article on "The Modern House and the Modern Picture," Mr. Clutton-Brock maintains that the falling off of picture buying is not as had been suggested in an earlier number, due to the fact that the modern decorated house has no place for pictures, but to the fact that modern pictures are not decorative—are, indeed, too often not pictures, in any proper sense, at all. "There can be no principle of selection without an object," he says, "and most pictures at present are painted without an object, and therefore upon no principle of selection." He urges painters, if they cannot design a picture for a particular room, at least to design it "like a good piece of china, so that it will be a reasonable ornament to a reasonable room." This is written for England, but some of our own painters might perhaps consider how much of the preference of the patrons for second-rate "Old Masters," of which they complain, is due to the fact that these old pictures, or even the fraudulent imitations of old pictures, have a decorative value, and are "a reasonable ornament to a reasonable room," while too many of their own works, whatever their scientific or psychological value, could never ornament anything.

From Lemcke & Buechner comes the announcement of a work on "Assyrische Skulpturen," designed primarily to illustrate the historical and prophetic books of the Old Testament. The work is to extend to twelve *Lieferungen*, each containing fifteen large plates with text. Nine have already appeared, the editor, after the fourth, being Dr. Archibald Paterson. The specimen plate sent to us is magnificent, but the English subscription is amusing, viz.: "Assur-Bani-Pal Pourring Libations over Dead Lions before a Altar"; nor is the French much better.

In "Studies in Pictures" (Charles Scribner's Sons), J. C. Van Dyke writes with his usual cool good sense. The book is intended as "an introduction to the famous galleries," and warns the traveller as to what he may and may not expect, putting him into the proper frame of mind to appreciate masterpieces that may appear strange to his modern sense, and clearing away misconceptions and preconceived ideas. The first part, in five chapters, deals with the modern gallery where the masters are out of place; with restoration and repainting; with false attributions, copies, and forgeries; with the themes of the masters, which meant more to them than to us; and with their workmanship, which is still as important as ever. The second part deals successively with the various departments of painting, as figure painting, portrait painting, genre painting, animal painting, and landscape and marine painting. On all these subjects Mr. Van Dyke speaks intelligently, his greatest limitation of sympathy appearing in his treatment of the classical ideal, where he seems to lump everything together, from Ingres to the bonbon box painters, as merely pretty and popular, and lacking in all strength and character. To speak of the work of Ingres as "empty," "forceless," and "insipid," is only less absurd than to speak of it as "always popular with the unthinking mob"; and such absurdity is only partly redeemed by the acknowledgment that "not all pictures are to be judged by this [the naturalistic] standard," and that "classic or academic drawing may be extremely graceful and fill space decoratively." Imagine the master of incisive line as forceless and insipid—the painter of the portrait of Bertin as merely a graceful decorator, the harsh and austere advocate of artistic probity as a complaisant caterer to the vulgar many! Of course, Mr. Van Dyke does not really mean this, but it was negligent of him to give that impression. For the rest, his book may be recommended to those concerned as generally sound and useful.

W. G. Rawlinson's catalogue and description of Turner's "Liber Studiorum," first published in 1878, is now issued, in a thoroughly revised second edition, by the Macmillan Company. It is almost a model of what such a book should be, and is likely to be indispensable to the student of Turner's great work. By the inclusion of many quotations from Ruskin and other writers, with whom Mr. Rawlinson does not hesitate on occasion to disagree, and of the correspondence between Turner and his engravers and other matter printed in the appendices, a large part of the book is even made readable, though it pretends only to be a work of reference.

Paintings by H. H. Reppert will be exhibited at the Lenox Art Academy till April 27, inclusive; recent pictures by Carleton Wiggins at Macbeth's, April 27; paintings by Orlando Rouland, Clausen's, April 30; water colors by C. S. Forbes, George Busse's, April 30; drawings and etchings by Daubigny, Frederick Keppel & Co.'s, May 1.

A collection of paintings gathered by Mrs. Anna N. Kendall of Latrobe, Ill., was sold at auction at the American Art Galleries in this city last Friday night. The following are the more notable prices: Anton Mauve, The Grafter's Cow, $1,650; Nature, $3,000; Josef Israëls, The Bashful Suitor, $1,500; the Young Mother, $1,750; First Steps, $4,300; B. J. Blommers, The New Baby, $1,550; Children of the Beach, $1,700; The Simple Life, $1,650; Jacob Maris, Barges, Ville-Girerre, $3,550; J. H. Weissenbruch, A Hazy Day, $1,800; Théophile de Bock, Approaching Storm, $1,500; Albert Neuhuys, The Latest News, $3,050; Willem Maris, Ducks and Ducklings, $2,750; Fritz Thaulow, Bridge at Verona, $2,000.

An exhibition of portraits of women, painted by leading French artists between 1870 and 1900, will be open in Paris, at Bagatelle, on May 15.

Finance.

"LOAN EXPANSION."

On Saturday, April 13, the weekly statement of the New York Associated Banks

reported an increase of $36,968,000 in loans, and Wall Street—which takes as keen interest in a "new high record" in financial statistics as the sporting community takes in a lowering of the "trotting record"—announced at once that this was the largest weekly loan expansion ever known. Only on three previous occasions, indeed, had as large a weekly increase as $30,000,000 been achieved; only in six weeks of New York's banking history—all of them falling since 1899—had a week's loan expansion run beyond $20,000,000.

Compared with the maximum weekly returns of the great state banks of Europe, the $36,968,000 increase was not a "record." There are occasions—chiefly the "year-end settlements"—when those institutions take over, for various reasons, large liabilities of the private banks of their vicinity, and show a weekly loan expansion larger than this figure. Thus, in the week ending January 3, this year, the Bank of France added $67,000,000 to its loan account and the Imperial Bank of Germany $92,000,000, both of which sums much exceeded the New York loan expansion of two weeks ago. But in the very next week of January, the French and German banks reduced their loan account, respectively, $59,000,000 and $84,000,000. In other words, the huge expansion of the week before had been only for temporary purposes. This was not the case with New York's increase in the week ending April 13. On the contrary, last Saturday's bank statement, covering the week ending April 20, reported further increase of $25,347,000.

For the fortnight, therefore, bank loans at New York had expanded $62,656,000. The nearest parallel to this remarkable two-week showing was an increase of $51,231,000, early in 1905. It will be of some interest to inquire what the reason is for such increase. On the face of things, this borrowing is certainly not less remarkable in that it followed immediately on a Stock Exchange "liquidating" movement, in the course of which bank loans in the tens of millions, previously used by speculators to "carry" stocks, were known to have been paid off and cancelled. This Wall Street liquidation had continued during the greater part of the present year; yet the total New York bank loan account, last Saturday, was $92,000,000 greater than at the close of 1906. How is this seeming discrepancy from the December figures, and how, in particular, is the record-breaking loan expansion of the fortnight past, to be explained?

Partly by certain large operations in connection with new issues of securities. In December, three great railways—the Northern Pacific, the Great Northern, and the Chicago, Milwaukee and St. Paul—offered to their shareholders new stock, amounting in the aggregate to $250,000,000. Of the Great Northern's $60,000,000 issue, subscribers were to pay 10 per cent. on January 21, and equal instalments on February 7, March 7, and April 8; but the Minnesota lawyers obtained an injunction, and payments were therefore suspended until a few weeks ago, when the injunction was dissolved. As a result, 40 per cent., or $24,000,000, became payable in the second week of April, and in the following week subscriptions to a $30,000,000 bond issue of the American Telephone Company fell due. It is the custom of large subscribers to such security issues to borrow from banks most of the money for the instalment payments, pledging as collateral on such loans the stocks which they own. In due course, loans made for such purpose are paid off from accruing income.

Although many subscriptions of the sort are made without raising money from the banks, these incidents account for much of the loan increase. They do not account for all, especially when the fortnight's $62,056,000 loan expansion was made in the face of reduction in ordinary Stock Exchange loans. The true explanation lies in two well-known incidents of the money market: the enormous borrowing by Wall Street from foreign banks and from banks at interior cities, when New York money rates were high last winter, and the paying off of such loans when money fell to low figures at New York. When the fortnight began, within which this great New York loan expansion fell, demand loans were bringing as high as 3½ per cent. in Wall Street, and short time loans 4½. When the fortnight ended, demand loans had gone as low as 1¾ per cent. and short-time loans to 3. Banks in London, Paris, Berlin, or in our own larger interior cities, could earn more than this by lending money at home; naturally, therefore, they called in their Wall Street loans.

As they did so, the loans thus cancelled were assumed by New York banks, whose increased cash reserve entitled them to do so. Many Western banks keep large deposits with New York institutions, for the use of which the New York banks pay them at the rate of 2 per cent. When Wall Street money rates rise to 6, or 8, or 20 per cent., it is clearly the interest of an inland bank to withdraw its deposits from the New York institution and lend them out for its own account at the market rate. But when Wall Street bids very low rates for money, it is equally the interest of these out-of-town banks to cancel their Wall Street loans and leave the proceeds again on deposit at the 2 per cent. rate. Naturally, the bank which receives such a deposit loses no time in lending it out again. This process, very extensively pursued in 1904, has been repeated this month.

The magnitude of this recent increase in the loan account results partly from the suddenness of the fall in New York money rates—a consequence of the Stock Exchange liquidation—and partly also from the fact that rates at interior money markets have not declined so rapidly. This last is an interesting phase of the present situation because it suggests that the West, if its own trade activity continues unabated, may possibly have less money to spare when Wall Street again tries to "finance a boom." To what extent the interior lenders helped to sustain last winter's speculation may be judged from the fact that, in November, bankers estimated that $200,000,000 "Western money" was then lent out in Wall Street.

SCIENCE

Salisbury's Physiography
By ROLLIN D. SALISBURY, Professor in the University of Chicago. (American Science Series.) xx+770 pp. 8vo. (*Ready in May.*)
This latest addition to the American Science Series is the most comprehensive work on physiography which has been published in this country. It is intended to be a text-book for an elementary course in colleges or a course in normal schools. It is distinctly readable and, like the Chamberlin and Salisbury Geology, will be interesting to the general reader as well as valuable to the student as a text-book.

Remsen's Introduction to the Study of Chemistry. *New Edition.*
By IRA REMSEN, President of the Johns Hopkins University. (*American Science Series, Briefer Course.*) xxiv +516 pp. 12mo. $1.12 net.
Professor C. F. Chandler, Columbia University, New York:—I have long regarded this book as the best one of its kind, and we use it regularly in the chemical department of Columbia University. This last edition is an improvement on the previous one because, while it retains its admirable system, it has been simplified in some respects, and it brings the subject down to date.

Kellogg's American Insects
By VERNON L. KELLOGG, Professor in Leland Stanford University. With 812 figures and 11 colored plates. 647 pp. $5.00 net. (Postage 34 cents). *New Students' Edition*, $4.00 net.

Cabot's Everyday Ethics
By ELLA LYMAN CABOT. 439 pages. 12mo. $1.25 net.
Colin S. Buell, Williams Memorial Institute, New London, Conn.:—Not often do I write a recommendation of a book, but I must say that I have been charmed with this. It makes interesting reading, and the principles are so presented that they can be easily grasped and retained. I hope to use it.

ENGINEERING

Hoskins's Hydraulics
By L. M HOSKINS, Professor in Leland Stanford University. 271 pp. 8vo. $2.50 net.

Benjamin's Machine Design
By CHARLES H. BENJAMIN, Professor in the Case School of Science. 202 pp. 12mo. $2.00 net.

ENGLISH

Fulton's Rhetoric and Composition
By EDWARD FULTON, Professor in the University of Illinois. x + 259 pp. 12mo. $1.00 net.
Represents the work in rhetoric in the freshman year at a large university.
C. F. Ausley, Professor in the University of Iowa:—It is a clean, sane, practical book and I shall be glad to recommend it to teachers

Hitchcock's Practice Book in English Composition
By ALFRED M. HITCHCOCK, Head of the English Department in the Hartford (Conn.) Public High School. xiv+226 pp. 12mo. 80 cents net.
It has already firmly established itself as a successful book, both in the first year of the high school and in the last year of the grammar grades
Kenneth Beal, Salem (Mass.) High School:—It is the first case of a book on that subject that I know of where the writer has had the courageous good sense to limit his effort rigidly to actual possibilities for the average boy and girl. The longer I teach, the more valuable seem to me some of the fundamentals that the country district school used to teach successfully, but that many a high school is failing to teach now. . . . You may put me on record as liking the wholesome, live good sense of the composition.

Lewis's The Principles of English Verse
By CHARLTON M. LEWIS, Professor in Yale University. 143 pp. 12 mo. $1.25 net.

Addison: Selections
Edited by EDWARD B. REED, Assistant Professor in Yale University. (*English Readings.*) xxxii+360 pp. 16 mo. 75 cents net.

MODERN LANGUAGES

Goethe: Faust. ERSTER THEIL
Edited with introduction and notes by JULIUS GOEBEL, Professor in Stanford University. lxi+384 pp. 16mo. $1.12 net.

Wildenbruch: Das edle Blut
With introduction, notes, vocabulary, and exercises based on the text by ASHLEY K. HARDY, Assistant Professor in Dartmouth College. *Illustrated.* viii+112 pp. 16mo. 35 cents net.

Meyer: Der Heilige
Edited, with introduction and notes, by C. E. EGGERT, Ph.D., Instructor in the University of Michigan. (*Ready in May.*)

Vreeland and Koren's French Syntax and Composition
By W. U. VREELAND, Professor in Princeton University, and WM. KOREN. (*Ready in May.*)

Hugo: Poems of Victor Hugo
With introduction and notes by ARTHUR GRAVES CANFIELD, Professor in the University of Michigan xl+358 pp. 16mo. $1 net.

Corneille: Le Cid, Horace and Polyeucte
Edited, with introduction and notes, by Prof. W. A. NITZE and Dr. S. L. GALPIN, of Amherst College. xxvii+393 pp. $1 net.

Molière: Tartuffe
Edited, with introduction and notes, by JOHN E. MATZKE, Professor in the Leland Stanford Junior University. xxvii + 169 pp. 16mo. 50 cents net.

Theuriet: L'Abbé Daniel
Edited, with introduction, notes, and vocabulary, by ROBERT L. TAYLOR, Professor in Dartmouth College. vii + 136 pp. 16mo. 35 cents net.

Pailleron: L'Etincelle
With notes and vocabulary by O. G. GUERLAC, Assistant Professor of French in Cornell University. xvii+98 pp. 16mo. 35 cents net.

Feuillet: Le Village
With introduction, notes and composition exercises by F. J. A. DAVIDSON, Professor in the University of Toronto. ix+83 pp 16mo. 20 cents net.

Renan: Ma Soeur Henriette
Edited, with notes and vocabulary, by WILLIAM F. GIESE, Associate Professor in the University of Wisconsin. (*Ready in May.*)

Ford's Romances of Chivalry in Italian Verse
Selections from the masterworks of Pulci, Boiardo, Tasso and Ariosto. With introduction and notes by J. D. M. FORD, Assistant Professor in Harvard University, and MARY A. FORD, Instructor in Modern Languages in the High School at Danbury, Conn. xxxvii+657 pp. 12mo. $2.00 net.

The Nation.

NEW YORK, THURSDAY, MAY 2, 1907.

The Week.

Congressman Theodore E. Burton's speech at Trenton last Friday night marks a new stage in the Presidential candidacy of Secretary Taft. The Secretary has so far been in the attitude of a passive candidate. His own statement was that he would not refuse a nomination if it came to him, but that he thought it exceedingly unlikely that anything of the kind could happen. Now, however, it is clear that the movement in his behalf is to be made more aggressive. Mr. Burton not only speaks for those Republicans of Ohio who hope to wrest control of the organization from Foraker and Dick, but comes East and makes a deliberate announcement appealing for national support. This can only be interpreted as meaning that Mr. Taft will from now on be an active candidate. Loyalty to his friends will compel him to stay in the fight to the end. Even if the chief justiceship of the Supreme Court should fall vacant and be offered to him, he could not well accept it before the national convention, after the commitments he has now made. Thus the contest on the Republican side grows more interesting. Mr. Fairbanks complacently describes himself as the candidate of the West against the East. The public had scarcely thought of it in that way; but if it comes to a lining up of the West, the friends of Secretary Taft will have something to say.

It is not so simple a matter after all to use the Federal offices of New York State to put down ex-Congressman Wadsworth and exalt Gov. Hughes. Collector Sanders of Rochester, when appointed, had the endorsement of two Senators and seven Representatives. All of these feel that they have as good a right to a voice in the choice of his successor as in that of Sanders himself. Wadsworth's successor, though elected by Democratic votes, has just announced his intention of acting with the Republicans in the next Congress. But are the other six Congressmen from this internal revenue district to be deprived of their recognized right to consultation when they have themselves kept the Roosevelt faith throughout? The fact is, as no one ever pointed out more cogently than Theodore Roosevelt the civil-service reformer, that no half-measure is possible in the use of patronage for factional ends. Are officials appointed and removed to help the work of one good Governor? Then there can be no legitimate reason for denying the claims of any other of the same "type." The President, having openly recognized the use of public offices as rewards and punishments for politicians other than the incumbents thereof, future selections "for merit only" will become more difficult than ever. The consistent application of the spoilsman's method in the cause of reform might be an inspiring thing, but its drawbacks must be taken with its advantages.

Secretary Bonaparte offers an interesting variant on the common argument of the standpatters that you must not remove the tariff on Trust-made articles, for fear that the small producer of the same article will suffer still more severely. In a speech before the French-American Republican Club of Boston on Saturday night he aptly likened the Trusts to hogs "which crowd their smaller and weaker fellows from the feeding trough so that they don't get their fair share of our national prosperity." He believed the real problem was so to fence off the great beasts as to give the little ones a show. He added:

> The Democrats propose to cut off the supply of swill, or, in other words, to destroy our prosperity by unsettling all our business relations. No doubt this would soon make the big hogs as thin as razorbacks, but would the small ones fare any better? Remember, we don't complain of the former because they are big and fat, but because they keep the others thin and small. The more money the Trusts make, the better for the American people, provided all dealers outside the Trusts have a fair field and the Trusts no favor.

Now, the policy of the Republican party and President Roosevelt was, according to Mr. Bonaparte, to keep "each big pig in its proper pen, where it can't crowd out any of the little fellows around it." This is a charming picture of the contented porkers, each in his particular pen, none getting a drop more of swill than his due. To argue from it is, however, like arguing from a metaphor, for the simple but sufficient reason that pigs are pigs. So long as the Republican party continues to flood the trough with swill in the form of tariff favors, so long will the big hogs crowd the little ones away. The separating partitions which Secretary Bonaparte imagines must, if there is to be even a possibility of competition in trade, always remain a mere figment of the imagination.

The recent announcement that President Roosevelt "is seriously considering the advisability of asking Congress to enact a statute providing that all campaign expenses of candidates in national elections shall be defrayed by the Government, and appropriating the funds therefor" must have startled many newspaper readers. Yet that which seems at first sight a radical departure from the theory of our politics, is in reality only an extreme application of the same principle of party recognition which has made such extraordinary headway within the past few years. For better or worse, we have given to what was originally a more or less indefinite private association, legal status, definite rights, and definite responsibilities. By comparison with what has already been done toward making the party a regular part of our governmental machinery, the mere payment every four years of a few millions of money raised by taxation, might be regarded as only an incident. For an illustration of conditions when the party had no legal status at all, it would be necessary to go back to the days when *viva voce* voting prevailed in some of the States. The unofficial ballot, still in use in some Southern States, theoretically permitted every man to make out such a ticket as he chose; in practice, the printing of ballots has always been done by the politicians. Then came the Australian ballot; and after that the movement for primaries under the same legal restrictions as the regular elections. The State, having paid the expense of printing the party ticket on the election-day ballot, was asked to pay the whole expense of what were originally caucuses wholly within the several parties. This is a long step, yet most of the States have already taken it.

No more useful gift could have been made to the colored people of the South at this time than Miss Anna T. Jeanes's million-dollar fund for the small negro schools in towns and in the rural districts, which are not part of the State school system. Their number grows from year to year; their needs are never satisfied, and ought not to be, if they are to develop along the right lines. For example, an admirable Alabama negro school, with an enrolment of 225 scholars, which takes the place of four wretched one-teacher cabin schools and has been of incalculable moral and educational value to its community, receives less than $100 a year from the public funds, about one-third of what was awarded to it when it started. In Atlanta, there are 6,000 colored children roaming the streets and headed straight for a life of indolence and crime, because there are no sittings in the public schools for them. As a result, the colored people are building up a number of private schools—misnamed colleges.

By no means all of these applicants for aid are worthy; many of their schools lack proper bookkeeping, a scientifically developed course of study, and competent teachers; while some are in unworthy hands, or are located too near other and better institutions. Here lies the great opportunity of the trustees of the Jeanes Fund. Of far greater value than the $40,000 or $50,000 they will have to dispense annually will be the influence they can exert upon all the schools Miss Jeanes wishes to aid. They can refuse to help any school which has not the bookkeeping system devised for Hampton and Tuskegee; and they can demand a standard curriculum, for the requirements of the colored people in the rural districts are substantially the same everywhere. The trustees can insist that teachers shall have proper certificates of efficiency, and can also influence the selection of adequately trained principals. Moreover, the Jeanes trustees can see to it that schools which now devote themselves only to class-room work bestow more attention upon the communities in which they are located. The Calhoun, Ala., school has fairly revolutionized the life of the colored people within a radius of twenty-five miles, by means of farmers' institutes, mothers' meetings, and by missionaries, some of whom teach the negro how to buy his farm, and how to get the best possible crops, while others enter the cabins as nurses or as teachers of domestic science, etc. Every well-established negro school should be compelled to extend its influence in this way. President Roosevelt has declared that there ought to be a manual training school for blacks in every county. The Jeanes Fund may be able to start some such schools where they are now lacking.

It is not to be supposed that Mayor Schmitz can tell the San Francisco grand jury and the public prosecutor very much that they do not know already about the reign of graft in that stricken city. Yet his reported offer to resign his office at once, and make, in return for immunity, a full confession of his relation to the trolley deal and other scandals of his administration, testifies to the state of mind that must exist among the plunderers of the city. From this time on, the prosecutions will proceed with a new moral advantage; and this is doubly true if the forces of the law are in a position to reject Schmitz's overtures, and proceed without favor or compromise. In every similar municipal "clean-up" in the past, some similar panic has marked the turn of advantage to the reformers. From the moment of Tweed's flight, the breaking of the ring in this city was no longer in doubt. But, however this may be, Mayor Schmitz's desire to confess and aid the prosecution is the logical outcome of his break with Boss Ruef. Honest men in San Francisco seem likely to come to their own, after all.

The American Museum of Natural History in this city has abandoned the plan of reserving two days each week for members and for others who will pay an entrance fee, and hereafter its exhibition halls will be open daily, and free to all. The arguments by which President Morris K. Jesup and the Director, Dr. Hermon C. Bumpus, support this change are worthy of serious consideration by all who are interested in the management of museums. When the Museum was relatively small and the halls were overcrowded, there were valid reasons for restricting attendance on certain days; but these reasons no longer exist. "The reservation," says Mr. Jesup, "really amounts to the closing of our doors to the public for approximately one-third of the time." He adds:

> Any regulation that interferes with the general enjoyment of its privileges is contrary to the spirit of its founders and opposed to the wishes of its supporters.

He believes, moreover, that the members "are not actuated by selfish motives; they contribute because they believe in the work that the Museum is doing and because they derive pleasure from being associated with it." That the new plan will increase by about one-third the efficiency of one of the greatest education institutions of the country is obvious. In connection with this new policy we may note that in Italy there is much discussion of the matter of entrance fees at museums. Some hold that it is beneath the dignity of the Government to limit the use of the galleries by demanding any fee whatever. Others maintain that a great opportunity for money-making is being thriftlessly wasted. Every foreigner, it is said, would as readily pay two francs as one to see the Uffizi, ten as readily as two-and-a-half to visit Pompeii. A compromise has also been proposed, namely, to open the galleries for several days a week at a nominal fee, say ten centesimi (two cents), abolishing the free Sunday. It is thought that this would thin out the holiday mob without excluding any one who was really interested. The experiment of a bargain-day might well be tried in this country. It seems, for example, that there ought to be some middle way between the deserted condition of the Metropolitan Museum on pay days and its overcrowded condition on Sunday.

Franz Kneisel planning to abandon chamber music! The report seems incredible, yet its mere appearance will bring grief to music-lovers the country over, until it is finally denied. Confirmed, we shall continue to believe, it cannot be. Mr. Kneisel and his fellow quartet-players have done a wonderful work, not merely in placing themselves in the front rank among musicians, but in educating the American public to a knowledge of what fine chamber music really is. More than a hundred concerts a year have they given, North, East, South, and West, in towns, cities, schools, and colleges. Wherever they have gone they have raised musical standards and created a thirst for the purest forms of string music. Other quartets have followed in their footsteps, until now five or six are able to make a satisfactory living. Not one, however, is in the same class with the Kneisels, whose reputation has long since become international. To lose "the Kneisels" now would be, for years to come, an irreparable loss. An excellent conductor their leader would undoubtedly make for the Philadelphia or any other orchestra. Surely, however, there are laurels enough left for Mr. Kneisel in his chosen field, without his having to give up his exquisite violin.

The author of "Il Santo" is naturally delighted at the honor that has come to him across the ocean in the form of a letter of praise from President Roosevelt, accompanying an invitation to visit the United States. Antonio Fogazzaro would be more than human if he failed to glow at the thought that his latest book of the spirit had gained the attention of a man whose time must be taken up by the harsh business of an intensely practical world. He would be more than human, too, if he failed to recognize what such a recommendation must mean for the circulation of his novel in this country—and in Germany. On the part of the President, it required commendable courage to take the step. Fogazzaro's book is on the Index, many good Catholics will consequently be displeased, and Mgr. Montagnini will be more convinced than ever that Mr. Roosevelt is a free-thinker. But, on the other hand, it cannot but redound to the nation's fame to have men like Pastor Wagner in France and Fogazzaro in Italy come to act as sympathetic interpreters of our spirit and our civilization to the Europeans. Other men in other countries stand for the same lofty tendencies in a materialistic age as these two men. Peter Rosegger might come from Austria, and Gustav Frenssen from Germany, if authoritatively summoned. Will some in Italy sneer at us for a prim and puritan, if not hypocritical, people, and ask why we did not invite D'Annunzio long ago? We hope not; all Italians should be grateful for what is, in all sincerity, a striking compliment from a notable man to a great writer.

The American peril is seriously alarming art lovers in Germany. Two years ago the *Zeitgeist* printed a symposium of expert opinions from all European countries on the subject of the wholesale buying of art works by American millionaires. In the meantime the peril has steadily increased. After the recent purchase of the Hainauer collection the Kaiser expressed his displeasure in language which once more brought this question to the fore. The Berlin *Tageblatt* prints a long letter from Prof. Paul Clemen of Bonn, who offers various suggestions as to the best way of thwarting the Americans. That they must be restrained is clear to him. There are in Germany and France collectors who have invested half their fortune in works of art; what would happen, he asks, if one of the American multimillionaires should follow this example? Greece made a law, as long ago as 1834, that all art treasures in the country must be regarded as national possessions. Italy has strict regulations regarding the sale of even private collections. Germany has none, and Professor Clemen doubts whether any could be enforced. What he objects to particularly is the secret sale of collections before the national galleries have had a chance to compete. He suggests a statute compelling timely publicity in cases of intended sale, and the formation of a protective alliance of German museum and art gallery directors against the designing Americans.

The reported condemnation of Baron von Puttkamer, the notorious former governor of the German Cameroons, is probably the close of an incident that has reflected discredit on the methods of German colonial administration in the past. A notorious debauchee, a spendthrift, and a tyrant of the worst sort, Puttkamer by his misdeeds while governor supplied the opponents of the Colonial Office, notably the Centre, with valuable material, which they did their best to employ in the Reichstag and before the country. The accused, we are told, "defended his policy towards the natives and complained of the attitude of the missionaries, whose motto was: Everything for the blacks, and nothing for civilization." Civilization, as typified by Von Puttkamer in the Cameroons, meant the importation of a Berlin actress under the euphemistic title of "cousin" and her installation in a luxurious residence built at Government expense; the handing over of native women to soldiers and civilians at will; the stringing up of natives by their thumbs till they died; and the instigation of violence against those missionaries who ventured to protest. The Germans, with true national passion for the abstractly scientific, have designated such cases of what is nothing less than degeneracy on the part of the white rulers of Africa, as forms of a disease which they call "tropical wrath." If, however, European ideas of morals and conduct are bound to shrivel a good deal under the equatorial heat, colonial offices can at least do better than start with ready-made gamesters and sensualists. Von Puttkamer's condemnation is apparently good proof that the German Government has taken the lesson to heart.

Without exaggerating the labor troubles in France, we may surely say that it is no sign of healthy conditions that, with the approach of every first of May, the capital should be placed under quasi-military law, and the prominent agitators arrested. As usual, fear of workmen's riots, and worse, centres about the central union organization, the Confederation of Labor. This has repeatedly come to the front as the most uncompromising revolutionary body in France. Its present ascendency is indicative of a two-fold development within the ranks of French Socialism. On the one hand, the policy of coöperating with the bourgeois parties, which began with the entry of Millerand into the cabinet of "concentration" formed by Waldeck-Rousseau in 1899, has continued to be upheld by a faction of the Socialists, with the result that the present ministry contains no less than three members or former members of that party. But the usual sobering or "reactionary" effect which office has exercised on ministerial Socialists has undoubtedly created among the rank and file of the party great dissatisfaction with the policy of opportunism, and given a decided impetus to a reversion towards revolutionary Socialism. "What, is it Clemenceau, Briand, and Viviani who arrest me?" one of the labor leaders taken into custody on Monday is reported to have cried. "What have they done to get where they are? They preached an awakening. Now they are provided for, they become reactionaries. While they were nothing, they did just what we are doing." Thus it would appear that the orthodox Marxian Socialism is waning. It stood for absolutely no compromise with the bourgeoisie, but it stood also for the peaceful conquest of political power by means of the ballot. To-day one element represented by the Independent Socialists is drifting towards a merger with the non-proletarian radical parties, while another element is headed straight for something much like insurrection.

Sir Henry Cotton, who was for thirty-five years in the civil service in the northeast of India, continues, in a revised edition of his "New India: or India in Transition," to criticise with great freedom the English administration of that country. He finds that the theory of the established land revenue system is that the land belongs to "a small minority of foreigners," or "party of foreign occupiers who choose to call themselves the state." He resents the right of interference with the criminal courts of minor degree now possessed by the local British executive officers. From these and other causes he deduces the reasons for what he terms the "increased bitterness" between the races. Believing the original conquest of India to have been highly discreditable to England, Sir Henry hopes that eventually India will consist of a number of united states, similar to those in Australia and the provinces of Canada. He would have "an organization of small states, each with a prince at its head, and a small body of patrician aristocracy interposing between him and the lower orders of working men." Obviously, Sir Henry is no democrat; but he believes in justice even to the dark-skinned. Naturally, his original views and his readiness to find fault with his countrymen have led to his being written down a crank, a "rash dreamer," and as one lacking loyalty. But his book is none the less a most useful contribution to the analysis of conditions in India—a country which is now in the throes of transition.

Peace seems probable in Central America. It is officially reported that a treaty was signed last week between the representatives of Salvador and Nicaragua at Amapala, and that the United States cruisers Boston and Chicago have left for other parts. When the police leisurely depart, swinging their clubs, trouble is presumably over for the time. The only chance of further complications comes from the side of Honduras. There the revolutionaries are reported as disgruntled at their treatment by President Zelaya of Nicaragua. No particulars are given of the nature of the treaty concluded at Amapala, but, as usual in Central America, the reverse of the logical orders seems to have been followed. We are told that "the conditions offered by Salvador [which was so badly defeated] were accepted, while the demands of President Zelaya of Nicaragua [which won a really notable victory] for reparation on account of the part played by Salvador [defeated] in the war between Honduras [likewise defeated] and Nicaragua [victorious] were rejected." Thereupon peace was concluded on "terms honorable to both parties." Opera bouffe, Central American war is often called, and opera bouffe it undoubtedly is in many phases. But when it comes to actual fighting, the mestizo or Indian displays a zeal worthy of a better cause. In the recent decisive battle near Choluteca, the reports would indicate a percentage of casualties quite as high as at Mukden.

TRULY UNDESIRABLE CITIZENS.

If it is the hit bird that flutters, the evidence is clear that President Roosevelt's shot at those labor unions which live upon violence, has gone home. Dispatches from various parts of the country speak of the amazed wrath of arrogant labor leaders that any man should dare to beard them. Their plans, in the way of protest and vengeance, are numerous. All "labor" is to stop work on a given day in May in order to register a mighty rebuke to the President. There are to be indignant parades and mass-meetings. One proposal is that organized labor adopt in a body the title "undesirable citizens," applied by Mr. Roosevelt to Debs, Moyer, and Haywood. The idea is to have another "bold type of shame to homage turned"; to imitate the "Beggars" of Holland in wearing as an ornamental badge what had been affixed in opprobrium.

These passionate outbursts prove what a word in season the President has spoken. Tyranny is always enraged when challenged; and it is the tyrannical spirit of labor unions that is leading them into these absurdities of madness. They had been coddled and toadied to and cringed to so long, and had gradually built up such an inflated notion of their power and immunity from criticism and from the law itself, that they had come to think they owned the country and held all public officers in a leash. It was high time, therefore, that some one in authority, and having the ear of the nation, should utter the truth. This the President has now done. His act is not only fine in itself, but is bound to have wholesome consequences. The entire question of the attitude and political demands of labor unions will now be discussed with a frankness to which we have long been unaccustomed. So infectious is courage!

On the merits of the immediate issue, there is no doubt that Mr. Roosevelt, if anything, understated the truth. That organized labor in this country has deliberately adopted violence and lawlessness, as among the weapons whereby to perfect its monopoly and enhance its tyranny, no one will dispute who keeps his eyes open. It is not simply that, as the President says, some representatives of labor are open "preachers of violence," but that habitually the precept is put into practice. "Incitement to or apology for bloodshed and violence" has been far more common than the President intimates. Bludgeons, dynamite, and bullets are the regular accompaniment of every great strike. In Chicago, the unions had what they called an "Entertainment Committee." Its object was to entertain every arriving non-union man by clubbing him over the head. All the important strikes of organized labor during the past twenty years have had organized thugs and murderers stalking in their shadow. This was true of the great anthracite strike of 1902. It would have been well if President Roosevelt had, at that crisis, stated with as much vigor as he does to-day the impossibility of tolerating crime, even when masquerading as organized labor. But thanks should not be grudged him now for having so sharply drawn the line between good citizenship and that which is not only undesirable, but inimical to social order and the lawful ongoing of government.

It is no chance thing that the unions all over the country have leaped to make the cause of Moyer and Haywood their own. They are aware of the deep solidarity which unites them to these "brothers." Whether the men are guilty of the murder of Gov. Steunenberg, no one can say till the evidence is produced at the trial; but that is not the point. The accused men are felt in a peculiar way to stand for that policy of intimidation and brutality which has marked the career of the Western Miners' Confederation. And the thing which makes organized labor cry out and band together on this issue is that the law has presumed to interfere. Arrests have been made, the highest court in the land has upheld the legal processes invoked against union terrorism, and alarmed labor leaders fear that if this is allowed to go on, the vitality will be taken out of their organizations. Unless these can erect themselves above the law, and make themselves so dreaded a power that juries and judges and, above all, elected officials will not dare to meddle with them, their whole plan of conquest and aggrandizement will be in peril. This is the real secret of the movement to identify the cause of organized labor with that of two men indicted for murder.

The political consequences of President Roosevelt's bold stand and plain speech are already a subject of concern to timid Republicans. He has actually dared to fling his glove in the face of the labor vote! What disasters to the party may we not expect now? A President, even if not desiring reëlection himself, should not have been so reckless. Well, those may be right who see in Mr. Roosevelt's flat defiance of the labor men a sure sign that he does not mean to stand for office again. But that is neither here nor there. We have at last got, what we ought to have had long ago—a clear, unflinching definition by the President of the United States of the irrepressible conflict which must exist between labor unions and American institutions, until the former give up their proud claim of being not only superior to fair play, but above the law.

MONEY MARKETS AND PROSPERITY.

James J. Hill's admission that nothing more than a "slowing up" of business activity is to be expected, and that "the relaxation will be healthy," is an interesting sign of the change which has occurred, if not in the actual financial situation, at all events in the common view taken of it. People have not forgotten with what suddenness the flood of pessimistic prediction swept over us at the opening of the present year. All the indications pointed to a prosperity at the high notch of the generation. Producing and transportation enterprises were reporting unexampled profits. Volume of business, as shown by checks passed through the banks, was equally unparalleled; dividends of corporations were increasing; labor was in demand as at no previous stage of the "boom." The complaint most often heard concerned conditions which might themselves be construed into evidence of prosperity—the fact that the railways could not enlarge their facilities rapidly enough to provide for the astonishing volume of merchandise demanding transportation. When Mr. Hill phrased his diagnosis as "commercial paralysis, which, long continued, means slow commercial death," most people read his words with perplexity.

Presently it appeared that Mr. Hill was not alone in his opinion, nor was the absence of adequate transportation facilities the only ground of foreboding. The "turn of the year," which is usually, in this country at any rate, the occasion for hopeful forecast, was marked by a chorus of dismal prophecy. Not only transportation facilities, but the supplies of accumulated capital on which the business world depends for its various projects, were declared inadequate. For evidence, people look habitually to the bank reports and money rates of the large markets, and nobody could deny that the signs which they furnished were somewhat alarming.

The rate here, even for high-grade merchants' paper, had been the highest ever exacted in early autumn. The New York bank position was the weakest reported at any time in a quarter of a century, except in actual panic. The Bank of England had raised its discount rate to a figure not reached for twenty-five years except on the eve of either war or financial panic. The Bank of Germany made the weakest showing with which it had ended any year in its history. Along with this, came perfectly well-authenticated news that Wall Street financiers had incurred on foreign markets a possibly unprecedented floating debt; and, although ingenious arguments have been constructed to prove that this could not be so, because our "balance of trade" is so enormous,

nevertheless those men in a position to know bore witness that it was true; and the fact that such a debt had been incurred, in the face of the country's unusual command over the world's real capital, made the phenomenon all the more startling. The most experienced financiers looked with apprehension to the next few months.

Those months have now passed, and the situation differs singularly from what had been foretold. One after another the discount rates, fixed at high figures for protective purposes by the great European banks, have come down to normal figures. Wall Street itself, far from being in the throes of panic, with capital impossible to procure, finds its money rate distinctly lower than it was a year ago this week, and its bank position similarly stronger. It cannot, perhaps, be said that the world's markets have yet reëntered a period of easy money, because foreign discount rates are still much above the usual spring-time level. Nor would it be quite safe to say that supply and demand, in the market for capital, have yet returned to normal relations, when corporations raising money still have to pay high rates for short-time loans and cannot find a satisfactory market for their bonds. But merchants are able to borrow at reasonable rates, and of the acute strain which had been foreshadowed for this time there is no trace whatever. It is not, therefore, surprising that many people should ask whether the whole series of phenomena on which last January's pessimism was based, were not really an illusion, a product of needless fright.

To such a theory nobody who has studied our great cycles of financial uplift and depression is likely to listen. Even when prophecies of disaster were most numerous keen observers remarked that this very apprehension was the best guarantee that the predicted results would not follow. Serious financial catastrophe is not often foreseen with such unanimity. Most of our actual panics have been preceded by a general blind optimism. In this case, the warnings had immediate and practical results; a structure of Stock Exchange speculation, raised to reckless heights, conducted by capitalists who seemed to expect that their names and prestige would crown it with success, was hastily pulled down. Until this was done, few persons understood how great a part this extravagant Wall Street speculation had played in absorbing the surplus capital of the world.

Whether the remedy may be regarded as permanent, is another question. The answer would be easy, if one could assume that the past season's lesson would be remembered more than a few months, and that experiments of the same sort would not hereafter be undertaken, except with due regard to existing requirements of capital by legitimate trade. Unfortunately, these are assumptions which cannot be safely made in a speculative era. The stage in the "cycle of prosperity" when the speculation which results from abundance of unemployed money runs into speculation carried on without regard to the condition of the money market, is perfectly familiar. The outward sign, equally notorious, is the change from money markets which no strain seems to ruffle to a succession of convulsive movements such as have distinguished 1905 and 1906. These experiments are obviously full of danger, both immediate and remote. What the situation of the present moment indicates, however, is that predictions made last January of a swiftly approaching industrial collapse were too hasty.

TWO MONTHS OF THE DUMA.

At Plymouth Church, Brooklyn, Sunday night, Alexis Aladyin, one of the leaders of the Group of Toil in the first Russian Duma, is reported to have declared:

> If our conciliatory attitude to the present Government bears no fruit, and we are pushed to the wall, we shall fight. We pray that it shall never come; but if it does——

Mr. Aladyin's words sum up admirably the character of the present Russian Parliament as distinguished from its short-lived predecessor. The first Duma came to St. Petersburg spoiling for a fight; the second Duma has been as anxiously avoiding one. This Occidentalized Oriental people, which, according to proverb, we have but to scratch to find the Tartar, which is given to idle vaporing instead of fruitful action, which surrenders itself to millennial dreams, to be accomplished in a day, and which positively will *not* wait, has refuted the last named slander as it has done the others. Fairly patient this second Duma has been in the face of intended or unavoidable provocation. Indeed, at times it would seem as if the crisis of the "back-against-the-wall," anticipated by Mr. Aladyin, was evaded only by the Opposition's taking instruction from Poe's story of the Inquisition chamber, and causing the wall to move backwards.

With such unmistakable evidence of a desire on the part of the deputies to avoid a parliamentary collision, we can find scant reason for the rumors and alarums of "dissolution" which have been the order of the day since the first meeting of the present Duma. "The Social-Democratic leader has bitterly insulted the Ministerial bench. The Duma will be dissolved." "The reference of the budget to a committee has pleased M. Stolypin. The Duma seems assured of a long life." "The Prime Minister has written a sharp letter to M. Golovin, and the troops in St. Petersburg have received double rations. The Duma is on the eve of dissolution." "The Czar has received M. Golovin graciously, and gave no encouragement to the reactionary peasant deputies. The Duma's prospects seem excellent," etc. The actual facts of the situation are these: The Duma is at this moment fifty-nine days old, or within fifteen days of the total lifetime of the first Duma. Up to the present, it has weathered crisis after crisis with respect to the Government, whereas its predecessor, from the first day, plunged into a legislative deadlock. It has shown itself ready to recognize, or at least to accept in silence, constitutional limitations; whereas the first Duma was determined upon starting with a clean slate by resolving itself into a constituent convention. It can show on occasions an actual majority for the Government, whose support last year was restricted to a mere half-dozen of mild Octobrists. Above all, it has given no indication of resorting to any such revolutionary step as the projected appeal to the nation, which was the immediate cause of last year's dissolution.

But the question arises whether the Duma will not be dissolved in spite, or rather because, of the absence of all serious provocation; whether its complaisant attitude will not be taken as a confession of weakness, and an opportunity for reëstablishing in practice, if not in theory, the old autocratic rule. The cable reports announcing the imminent dissolution of the Duma generally represent the Government as "looking for trouble." Now, passing over such general and often vague arguments as may be founded on the personality of the Czar or his prime minister, we find that the very motive for the summoning of the first Duma ascribed to the Government by its opponents still holds good—namely, the need of raising a foreign loan. The subject has not yet been broached in the Duma, and, even conceding that the refusal of the deputies' sanction would precipitate a deadlock and dissolution, weeks, if not months, must pass before such a situation is brought about.

As to the make-up of the second, or "conciliatory," Duma, it is difficult to speak with precision, because parties have not as yet crystallized into definite form. Thus, an official classification made by a committee on organization, appointed by the Duma in March, has been called into question by the Constitutional Democrats, who object to being formally catalogued with the "Right Centre." The official classification is on the basis of complete lists, and accounts for five hundred and twenty-nine members. We may compare with it the analysis of the actual five hundred deputies, made by a leading correspondent. Giving the latter estimate in parentheses, we find at the extreme left the Social Democrats, 69 (51), led by

the St. Petersburg workman Alexinski and the Caucasian Prince Tseretelli, and in their attitude, irreconcilable. After them come the Social Revolutionaries, 41 (31), with the closely allied group of 19 Social-Populists. As with the Constitutional Democrats, their real leaders are not in the Duma; their parliamentary head is Dr. Gobunof, representative from the territory of Terek. The Group of Toil, 96 (61), under the leadership of Mr. Karavaef, closes the ranks of the Left. The Centre begins with the Mohammedan deputies, 37 (36), who are followed by the Poles, 46, and the Constitutional-Democrats, 88 (102). Octobrists and Monarchists, forming the Right, constitute about 100, according to both estimates, of which the second gives also some 30 deputies as without party affiliation. Thus, out of the 470 classified deputies, this correspondent gives about 170 to the Left, 100 to the Right, both wings being split up among themselves, and a "working" centre of 200, comprising Constitutional Democrats, with their allies from the partyless ranks, the Mussulmans, and the Poles.

This, then, must be counted as the record of the Duma's work for the past two months—that it has evolved a practical Centre, which can generally command a majority, and which has shown its willingness to "talk business." To the parties of the Left, the Duma is still a "centre for carrying on the revolutionary propaganda," as one of their leaders has expressed it. They avow it openly in Parliament through the mouths of such men as Alexinski and Tseretelli. If they refrain from extreme measures, it is solely for prudential reasons. But, on the other hand, the Constitutional Democrats, who last year undoubtedly held the same view of the Duma as an organ of revolutionary agitation, seem to have abandoned this plan for one more consonant with the usual functions of a parliamentary body. To that extent the second Duma has moved forward.

THE LAW OF PRIVATE LETTERS.

A recent judicial decision in England throws light upon a vexed problem of biographers and literary executors—who so often, as Coleridge said, make sad work of the testators' brains. What is a private letter? How can you draw a broad line of distinction between private and public letters? The question is partly what is lawful, partly what is expedient. An executor or biographer may be within his legal right in publishing a private letter, yet may thereby outrage good taste and even decency. On the other hand, the private letters of a great man, about whose life it is of interest to learn as much as possible, must at some time become fair matter for publication; and the question is, when?

All these queries, and others like them, were laid before an English judge in a friendly suit brought by the heirs of the late Duke of Rutland. He, as Lord John Manners, had played a part in public life, and by will left to his son "all private and family letters written after 1862." But there was also in the Duke's papers a classification of "letters upon political and public affairs written to the testator while holding office and at other times by his colleagues in the Government, and by Her Majesty the late Queen." The question was whether this class of letters should be adjudged "private." If so, they would go, under the will, to the present Duke; if not, to his brother. Mr. Justice Joyce held that they were not private letters. In his judgment, he pointed out that all letters not written for immediate publication may, in a sense, be held to be private; but that the lapse of time necessarily makes a difference in their legal status. The letters in dispute were undoubtedly private at one time, and their publication could have been prevented; but with the flight of years, and the changes in politics, they had lost their private character and might now be printed.

This decision, it is obvious, was purely legal. It related merely to the proper distribution of papers under a will. But it is clear that the question of literary propriety is also involved. Upon this the learned judge did not and could not pronounce; yet it falls within the scope of his distinctions. No point has been more mooted in biographical squabbles. Was it a crime for Froude to put into cold type so many of the personal revealings of Carlyle? Or was it an act of the finest loyalty and literary good conscience? The answer will plainly depend upon one's idea of how long the right of privacy ought to persist, and be respected, after death. In a somewhat different way, the same question was sharply argued at the time of the publication of the Browning letters. Nothing was disclosed not to the honor both of Mr. and Mrs. Browning; yet many felt that those intimate breathings of their very souls had a private quality which never should have been violated. Still another aspect of the dispute is suggested by the controversy over the Hohenlohe memoirs. It will be recalled that the Emperor was indignant at the publication of even a diary account of conversations with himself. This shows that the more public a character is, the more sacredly private it may be necessary to keep some things that concern him. President Roosevelt has shown the Kaiser how to do it by repudiating in advance any report of what he may have said in the loud and breezy confidences of the White House.

The general rule for the biographer to follow is simple. In the exercise of his discretion, what to publish and what not to publish, among the letters placed in his hands, he should be guided by both truth and charity. What would give needless pain to the living, or to their close friends, should not be allowed to get into print from the pen of the dead. Here is where we see the application of the principle laid down by Justice Joyce—that of the lapse of time. Sufficient time cannot be said to have elapsed to make a private letter public property, when its publication would unnecessarily lacerate the hearts of people whose feelings it is right to consider. A cruelty which a great man gone would not commit while alive, should not be inflicted in his name after he is dead. Of course, the vindication of character, the setting right of history, may sometimes require the disregard of personal susceptibilities. Sir Robert Peel's biographer, for example, was quite right to publish the fact that Disraeli had made his envenomed attack upon Peel only after he had first written to him, begging for office, and had been refused.

Judicial decisions in these matters will not help us much. The judgment of the English court we have cited, reasonable as it sounds, might be used as an excuse for a most unreasonable violation of private correspondence. Our own courts have a good deal whittled away the right of privacy. All the more reason, then, for insisting upon a standard of literary delicacy and consideration in all this affair of breaking lock and seal and bringing too rashly or prematurely to light letters of which their authors, if they could speak, would protest against the publication.

"ICHABOD" AND THE NEW THEOLOGY.

A dispatch from London last Friday reports a religious sensation in connection with the City Temple. Two grave and well-dressed men, with the solemnity of British middle-class citizens setting out to "bear testimony," mounted a long ladder and inscribed the word "Ichabod," in staring white letters a foot and a half high, over the portico of the famous church where Dr. Joseph Parker used to preach. This pious demonstration was, of course, directed against his successor, the Rev. R. J. Campbell. That clergyman's teachings, especially the publication of his recent book, "The New Theology," have scandalized many. They have, however, become the great topic of the hour in religious circles in England. So wide a sale and discussion of a theological treatise are probably unexampled. More nearly even than Canon Farrar's "Eternal Hope" in its day, has Mr. Campbell's book succeeded in doing what Macaulay hoped for his history. It has displaced the latest novel on the boudoir table, and is made the universal theme of dining-room chat and salon gossip.

To dub such a man "Ichabod" seems to the outsider something of a misnomer. This is hardly the time to ask, "Where is the glory?" Mr. Campbell's glory appears to be coming full. No man in England is more eagerly sought after to make addresses, preach sermons, and write articles. In the last *Hibbert Journal* he holds first place with a paper on "The Aim of the New Theology Movement." Such an Ichabod as he can afford to smile at his detractors. They, of course, simply desire in their odd way to express their disapproval of Mr. Campbell. Steeped in the Puritan tradition, they awkwardly use the old Puritan weapons of controversy. Having dutifully chalked up their "Ichabod," they doubtless went each man to his merchandise, and in their shops became once more modern Englishmen.

Turning from all this external flurry to Mr. Campbell's book itself, we find ample reasons for its vogue, but not many to justify either the acute alarm or the intense admiration with which it has been alternately regarded. One gets from it a pleasing impression of Mr. Campbell's personal qualities. He is evidently a man of very warm sympathies, not at all lacking in courage; he has a strain of poetry in him; he is a moving preacher, and his heart is filled with the largest aspirations for the good of mankind. Not so much can be said for his intellectual ability. Principal Fairbairn has delicately hinted at Mr. Campbell's deficient training in the subjects he discusses. This is manifest in every chapter. He attacks the oldest and toughest problems of theology and metaphysics, and has his little offhand solution for each one. This is the courage of conviction, no doubt, but it is also the courage of ignorance—or, at least, of lack of sufficient reading and thought. It is, no doubt, Mr. Campbell's easy dismissal of world-old difficulties which has led an eminent theologian, himself very liberal-minded, to say of his book that it is "a farrago of nonsense." It is something more than that on the human and religious side, but it is philosophically very weak. Indeed, where Mr. Campbell's new theology is not merely old heresy, it is too much a thing of shreds and patches. We have in him not a coördinating thinker, but an impulsive and emotional reformer.

Mr. Campbell is heart and soul a pragmatist. We hope our instructed readers know what "pragmatism" is. It is the reigning philosophical sensation. Harvard has been convulsed with it for months, and has sent missionaries to benighted Columbia to expound the new doctrine. It has been defined as really meaning: "It doesn't matter what you think, if your heart be in the right place." A fuller definition has been given by an old-fogey Cambridge professor: "Pragmatism is the system by which you hold one opinion to-day, and a contradictory one to-morrow, but with the comfort all the while of knowing that the other fellow is surely wrong." Such gibes must stand for what they are worth. What the serious pragmatists are driving at is indicated in one of Mr. Campbell's phrases. The New Theology, he writes in the *Hibbert Journal*, "discards" every theological doctrine "which has not a practical ethical value." Now, whatever may be said about this, it is certainly not "new." To go no further back than Albrecht Ritschl, we have in his voluminous theological writings a complete development of this idea that the only test of creeds is their "cash value," so to speak. And some of our New England theologians might smile at Mr. Campbell's enthusiasm as a discoverer of doctrines that they expounded before he was born.

But all this is only the accidental dress of the New Theology. If it is a little uncertain in history and logic, its moral aim and social programme are clear and fine. What concerns these earnest and devoted men, who are attaching themselves to the new movement in Italy and France, as well as in America and England, is the need of making the Church again the leader in reform, in binding together the hearts and hopes of the great masses of the people, and in restoring a real spiritual brotherhood on earth. It is not so much a formal Christian unity for which they labor, as a "practical concentration of all the Christian forces." They want to see the working classes won back to the churches. Their aspiration is to seize upon all the large moral and humane agitations of the day, give them the touch of religious faith, and make them contribute to the glory and usefulness of the Christian Church. It is not possible to withhold admiration from such zealous and unselfish souls. The gap between their thinking and their striving some one may one day rise up to bridge; but for the present, all can see that the fire of humanity burns within their breasts, and that they feel themselves inwardly called to a ministry of conciliation. Progress, whether in theology or society, may not come in the ways they count upon, but it cannot fail to be hastened by such labors as theirs.

THE KAISER'S MUSICAL MONUMENT.

Four years ago the leading male choirs of Germany had a contest at Frankfurt for a prize offered by the Emperor. He was present, and made a speech in which he expressed his gratification at the skill displayed. But, he added, he missed the best kind of *Männergesang*, such as we find in the German folksong. "It would have been a relief for all had one of the choirs sung Mendelssohn's 'Wer hat dich du schöner Wald.' I shall arrange for a collection of folksongs, in order that the *Männergesang* may be diverted to its proper sphere."

Naturally, such a criticism caused momentary irritation; but it was soon forgotten in the interest in the Kaiser's preparations for not only carrying out his promise, but doing it in regal style. Three months after the Frankfurt contest the Ministry of Public Worship had, at his instigation, worked out a plan for supplying the German singing societies with a collection of the choicest specimens of German folk music of several centuries. Funds were provided, and the leading musicians of the country invited to lend their services. The list of the men—composers, conductors, professors, critics—who helped to collect, sift, edit, and arrange, is a most imposing one; among the names included in it are Humperdinck, Richard Strauss, Max Bruch, Carl Reinecke, Ludwig Thuille, Robert Radecke, Georg Schumann, Thomas Koschat, Eduard Kremser, Hermann Kretzschmar, Max Friedlaender, Friedrich Hegar, Siegfried Ochs, Edler von Schuch, Hans Sitt, Fritz Vollbach, Eusebius Mandyczewski, Julius Röntgen, Bernhard Scholz, Leopold Schmidt, Philipp Wolfrum, Friedrich Gernsheim, Max Kalbeck, and others of national or international repute. More than forty composers engaged in the task of arranging the songs for male voices. As a result, no other country has anything like this "Volksliederbuch für Männerchor"; and, thanks to William II., Germany has once more asserted her musical supremacy.

The greatest difficulty confronting the commission of musical experts was the choice of the songs. Altogether about 17,000 came under consideration, and out of these, 610 were finally selected. They have been printed in two handsome volumes by the well-known firm of C. F. Peters. Although these volumes contain 1,515 pages of music and 87 pages of notes (with an admirable historic introduction by Freiherr von Liliencron), they are not unwieldy, and the price, too, is popular—only $2 for the two volumes—a sum which can hardly cover the cost of production. From this point of view, too, the "Volksliederbuch" is a present from the Kaiser to the musical world.

No less willing to coöperate in this monumental work than the musicians were the publishers, who readily granted permission to reprint copyrighted songs, reserving, however, the right of public performance. There are, of course, no rights in the folksongs, of which in most cases, even the creators are unknown; but the "Volksliederbuch" includes much beside the actual folk tunes. The Germans make a distinction between *Volkslieder* and *volksthümliche Lieder*, the first being songs of the people, by the people, the others art-songs

by known composers, which have been adopted by the people. Among the great composers who have written for male choirs are Weber, Schubert, Loewe, Mendelssohn Marschner, Kreutzer, Schumann, Franz, Brahms; and these are liberally represented. Bach, Handel, and others are represented by arrangements. The pilgrims' chorus from Wagner's "Tannhäuser" is included; nay, the commission was sufficiently catholic to welcome that leader of secessionists, Richard Strauss; doubtless on the ground that, as this "Liederbuch" was intended to give a bird's-eye view of the development of German music, its latest phase could not be consistently excluded. It cannot be denied, at the same time, that the Strauss contributions do look like black sheep in the fold. They are neither *Volkslieder* nor will they ever become *volksthümlich;* they lack all the elements of folk music—simplicity, tunefulness, spontaneity, sincerity, cordiality.

The wide range of folk music is indicated by the twelve sections into which these six hundred and ten songs are divided—religious; serious and devotional; songs of the fatherland and home; of nature; of travel and parting; songs of soldiers; of hunters, sailors, farmers, miners; festival songs; social and drinking songs; love-songs; ballads; comic and derisive songs. Under each head, the numbers are arranged chronologically, so far as possible, which makes the "Liederbuch," with its vivid poems, also a history of manners and morals during the last four centuries. Variety of color, too, is provided, the collectors having wisely included many choice specimens from other countries in which German is spoken, notably Austria, the Tyrol, and Switzerland; also the Netherlands, at the Kaiser's special and urgent desire.

The one thing to be regretted regarding this collection is that it should be available only for *Männergesangvereine.* American cities and colleges have their glee clubs, but, on the whole, the male choir is a much less conspicuous phenomenon in other countries than in Germany. However, Liliencron promises further editions, in which the songs will be issued arranged for mixed choir, or for solo voice, with pianoforte, with special volumes for use in church and school. When this has been done, it will be impossible to overestimate the importance of the "Volksliederbuch" for the cause of universal musical edification.

Especially from one point of view must it be welcomed. Folk music is, above all things, melodious, and the creation of new melodies is the one thing in music which cannot be taught. As early as the twelfth century, the European church composers began to adopt folk melodies and weave them into their contrapuntal fabrics. Martin Luther rejuvenated church music by bodily adopting many of the best folk tunes; and ever since that time the composers, secular as well as ecclesiastic, have sought to strengthen their melodic sense by contact with folk music. Now at no time, perhaps, since music became an art has there been such a melodic drought as there is at present. It would be too optimistic to hope that the study of the Kaiser's monumental collection will make original melodists of present-day composers; but, until they do become such, music-lovers may turn for consolation to the "Volksliederbuch."

RECENT GERMAN BOOKS.

Among the admirable little volumes edited by Georg Brandes, and published under the collective title Die Literatur, by Bard, Marquardt & Co., Berlin, there has recently appeared a complete review and just appreciation of German poetry of the present time: "Die deutsche Dichtung seit Heinrich Heine." The author, Karl Henckell, groups the poets according to tendencies, and supplements each sketch of a poet by selections from his verse. Henckell's language is at times too florid, but his metaphors are always apt and pithy, and convey a remarkably vivid image. When he calls Platen the sword-bearer of beauty, Heinrich von Reder the tough and knotty Rodensteiner of lyric verse, and Heinrich Leuthold the posthumous sovereign of beautiful form, little else is needed to assign to them their place. The book is illustrated by facsimiles of letters and manuscripts, and twenty-five portraits.

"Emile Zola," by Michael Georg Conrad, forms the twenty-eighth volume of the series. It is meet that the prophet of naturalism in Germany should add to the literature about Zola his estimate and personal impressions of his master. Conrad was one of the first Germans to join in Zola's cry for truth; and, not satisfied with preaching the theory of the new art in his periodical, *Die Gesellschaft*, he applied it to his fiction. The book takes its cue from conversations with Zola, which the author had during his sojourn in Paris, 1878-1884. There is the strong and intimate charm of a portrait sketched by one who profoundly understood and sincerely loved the original. There are many interesting glimpses of Zola in the privacy of his study. At one time Conrad writes:

> Zola is easily fanned into flame when the right wind comes along. His tongue, at other times rather heavy, then becomes singularly voluble, and his voice gives a resonant ring to his sentences. The whole man has a power that carries you away, and when his sacred convictions are touched, an impetuous heartiness. . . . He is one of those great personalities whose every fibre is filled with their mission, and who would risk their last drop of blood to realize their work. He is the incarnate conscience of his nation.

One of Conrad's most interesting chapters is devoted to Prof. Francesco de Sanctis, who, in the summer of 1879, delivered a lecture on Zola and "L'Assommoir" at the Circolo filologico in Naples. There is an appendix containing a complete bibliography of the French and German editions of Zola, and of the literature about him, which mentions only three books in the English language, those by Burrows, Dowden, and Vizetelly.

"Das Nibelungenlied," by Max Burkhardt, is a recent addition to the same series. In the Introduction the author emphasizes the necessity of a history of art which should prove that every work of art is not so much the product of an individual as a manifestation of something created by a whole generation, perhaps by many generations. Such is the "Nibelungenlied," the earliest traces of it dating back to those days, when the tribes which later developed into separate entities had not yet segregated. If we knew all the intermediate links in the evolution of the "Nibelungenlied," written at different times in different countries, we should have thousands of Nibelungen songs, each almost imperceptibly passing into the other. By way of illustration, Burkhardt traces the story of Troilus from its first appearance in Homer through the literature of ancient Greece and Rome to the mediæval French romance by Benoît de Ste. More, the versions by Guido of Colonna and by Bossaccio, the poem of Chaucer, and, finally, the play of Shakespeare. Burkhardt maintains that there is no other example in literature which so clearly demonstrates the evolution of one theme in the literary work of many centuries. The history of the "Nibelungenlied" admits of the same treatment, although the chain is not so unbroken. The author follows the story of the love of Siegfried and Kriemhild, Gunther and Brunhild, from the earliest poems in which it appears to the modern versions of the old theme by Geibel, Hebbel, Wilbrandt, and Jordan. The latter reproduced it in epic form, but, laboring under the curious delusion that the old faith of those prehistoric heroes foreshadowed the intellectual achievements of the present time, permitted himself anachronisms which were too palpable not to detract from the beauty of some portions of his work. While Jordan lowered the old hero-myth to the level of a romantic fairy tale, Richard Wagner in his "Ring des Nibelungen" raised it to the dignity of a work of art, which combines the Germanic story of the guilt and the defection of the gods with the saga of the heroic race of the Nibelung, and infuses into both a new life. Burkhardt does not claim completeness for the bibliography appended to his interesting treatise. The book is illustrated by reproductions of rare old woodcuts and facsimiles of manuscripts.

"Kant und Goethe," by Georg Simmel, is a volume in the series called Die Kultur, edited by Dr. Cornelius Gurlitt and published by Bard, Marquardt & Co., Berlin. The author refers to the spiritual currents and counter-currents in Germany, which in the fifties and sixties of the last century turned from the abstract idealism which characterized its beginning, to materialism. According to his thesis, the demand for a synthesis of these two contrasting views culminated in the seventh decade in the cry, "Back to Kant!" But the scientific solution which Kant could give, demanded, by its very onesidedness, to be supplemented by an æsthetic one; the strongly reawakened æsthetic interests, striving for the reintegration of spirit and reality, crystallized into the call, "Back to Goethe!" Simmel admits that Goethe cared

little for philosophy as such, and forces upon us the conclusion that as Kant was a philosopher by intention, Goethe was one by intuition. When Goethe says to Schiller, that the materialistic philosophers do not reach the mind, as the idealistic do not reach the body, and suggests that it is well to remain in the philosophical state of nature, and to make the best possible use of one's unseparate existence, he gives a key to his monistic view of life. It enters even into his relation to the ethics of Kant, for he says in a letter to Carlyle:

> Some have accepted selfishness as the motive of all moral action; others saw in the desire for contentment and happiness the only effective motive; again others ranked supreme the apodictic demand of duty; and none of these could be generally recognized—at the end one had to admit that it is best to evolve the moral and the beautiful from the whole complex entity of healthy human nature.

Simmel calls attention to Goethe's idea of the all-human, which he could discern at the bottom of every individual nationality and personality. It is this which made him a cosmopolite in the noblest sense of the word. The author also resents the charge that Goethe was an aristocrat, recalling a passage, in which Goethe declared that there was very little difference between an ordinary man and a genius, if it is compared with all they have in common. "The poetical gift is the peasant's as well as the knight's; all depends upon the individual's power to realize his state and treat it with dignity." There are thirteen illustrations, among them "The Thinker," by Rodin, to whom the book is dedicated, portraits of Erasmus by the younger Holbein, Carlyle by Whistler, Kant by Doebler, and a splendid profile of Goethe after a drawing by Jagemann.

"Aus der Zeit des Humanismus," by Ernst Borkowsky (Jena: Eugen Diederichs), is a book on the German renaissance, containing appreciations of Dürer, the Holbeins, Hans Sachs, Erasmus, Celtis, and other noted men, and ending with a study of two typical cities of the time, Nuremberg and Augsburg. The difference between the Italian and the German renaissance is strongly brought out. The author admits that the German renaissance lacked the sensuousness and the strong lights and colors of the Italian; but it was filled with youthful energy and the powerful desire to break the social, intellectual, and artistic barriers of the Middle Ages. While the Italian humanism was founded upon an æsthetical principle, Germany's was based upon ethical values of life. As the eye of the poets and the artists of the time rediscovered nature and recognized the pictorial value of the landscape, so the inner eye of man discovered the individual traits in human nature. The literature of the period shows a remarkable increase of letters and memoirs; the portrait severs its connection with historical painting; "the cult of personality becomes a momentum of social and intellectual development." Of the ten men portrayed in the book, each is a personality standing for the spirit of progress which characterized the period, for consummate scholarship, or for artistic achievement. The attitude of these men was hopeful; they were all looking towards the coming of the one who was to realize their dream of humanity. The preface closes with these words: "He for whom they waited came much later than they expected; the great humanist of Weimar—he was their Messiah." This book, of 250 pages, has twelve illustrations, among them Dürer's portrait of himself, and Holbein the Younger's, both exquisitely reproduced.

The appearance of Hutchins Hapgood's "Spirit of Labor" in this country calls attention to literature of the same class which has recently sprung up in Germany. A few years ago a volume of memoirs, called "Denkwuerdigkeiten und Erinnerungen eines Arbeiters," caused a mild sensation; it was the story of a skilled laborer of a type rapidly becoming extinct, who had long passed the zenith of his life and belonged to an older generation. Now the editor of that book, Dr. Paul Goehre, has prepared another which is called "Lebensgeschichte eines modernen Fabrikarbeiters" (Jena: Eugen Diederichs), and which pictures the life of a typical workingman of to-day as he himself has written it. Not only the story, but even the form of it, justifies the editor's use of the word "modern" in the title. A comparison of these two human documents is of vital interest to the student of sociology. While the ideas of social-democracy barely rose above the horizon of the first book, they are the very essence of the life told in this volume of 368 pages, with a simple truthfulness of detail which is at times pathetic. It is a mine of valuable information.

Among recent translations must be mentioned the third volume in that beautiful edition of Lafcadio Hearn's works, which are being remarkably well translated by Berta Franzos and published by the Literarische Anstalt of Fraukfort. "Izumo" is the title of this rendering into German of "Glimpses of Unfamiliar Japan." Like the preceding volumes, it has been illustrated by Emil Orlik, among modern German illustrators the one who has most deeply entered into the spirit of Japauese art.

The complete critical edition of Wilhelm Mueller's "Gedichte" (Berlin: B. Behr) is interesting to American readers, because the editor, Dr. James Taft Hatfield, is an American recognized abroad as an authority upon the work of the poet, whose verse has been rendered immortal by the music of Schubert.

NEWS FOR BIBLIOPHILES.

On May 6 and 7 the Anderson Auction Company of this city will sell the library of S. B. Matthews. The books illustrated by Randolph Caldecott, Kate Greenaway, and Walter Crane are notable. The illustrations by these artists are attracting more and more attention among collectors. On the evening of May 8, the same firm will hold a sale of engravings, mezzotints, color prints, etc., mainly from the collection of Miss Eleanor Barry, the actress. Included also is a considerable collection of play-bills, among them a number showing first appearances of Edmund Kean.

Part 5 of Dr. Kopetschny's collection will be offered by the Merwin-Clayton Sales Company of this city on May 6 and 7. This part includes some rare first editions of early English books, among them Baron's "Mirza," about 1650; Brewer's "Love-Sick King," 1655; Fielding's "Tragedy of Tragedies," 1731; Heywood's "Hierarchie of the Blessed Angels," 1635; Chaucer's "Works," Kele's undated edition, about 1542; an unusual series of books by Pope, including the first edition of the rare "Windsor Forest," 1713. The first editions of modern authors include: Charlotte Brontë's "Villette," 1853, cloth; Browning's "Bells and Pomegranates," the eight parts in one volume (Part 5, as usual, being second edition); Edward FitzGerald's "Six Dramas of Calderon Freely Translated," 1853; Emerson's "Poems," 1847, original boards, uncut. The books on natural history with colored plates include some works seldom offered in this country. Among them are: "The Birds of North America," by Baird, Cassin, and Lawrence, 2 vols., 1860; Batemau's "Orchidaceæ of Mexico and Guatemala," 1843, a superb work with colored plates, of which only 125 copies were printed; Blume's "Rumphia," 4 vols., containing colored plates of East Indian plants; Catesby's "Natural History of Carolina," third edition, 2 vols. folio, 1771; Edwards's "Histoire naturelle d'oiseaux peu communs," 8 vols., 1751-64; Ferussac and Deshayes's "Histoire naturelle des molusques," 4 vols., folio, 1821-51; Harris's "Aurelian," 1778; Smith's "Lepidopterous Insects of Georgia," 2 vols., 1797; Sweet's "British Flower Garden," 7 vols., 1838.

On May 7, 8, and 9, C. F. Libbie & Co. of Boston will sell some of the books, manuscripts, and broadsides which belonged to the two Boston historians, Samuel Adams Drake and his father Samuel G. Drake. The collection of revolutionary broadsides is especially rich, there being more than one hundred lots. Included is a specimen of the two-page single-sheet printed by Holt in New York, giving an account of the Boston massacre. A similar sheet brought $300 in the Proud sale in 1903. The series of American colonial newspapers is very long, nearly one hundred and fifty lots. There are numerous works on Boston, on American genealogy, and the Indians, several editions of the New England Primer, and early American almanacs.

On May 6, Sotheby, Wilkinson & Hodge of London sell part of the library of the late Henry Charles Harford. Several rare pieces of Americana are included. Among them is a copy of the first edition of the "Journal of Major George Washington," Williamsburg, 1754. Other important lots are: Roger William's "Bloudy Tenent of Persecution," 1644, and his "Bloody Tenent Yet More Bloody," 1652; Ashe's "Carolina, 1682, a nearly uncut copy; the first edition of Eden's translation of Peter Martyr's "Decades of the Newe Worlde," 1555; the second and enlarged edition issued with the title "The History of Travayle in the West and East Indies," 1577; Hakluyt's "Voyages," 1589, first edition; James's "Strange and Dangerous Voyage," 1633, with the rare map; Monardes's "Joyful Newes out of the New-founde Worlde," translated by John Frampton, 1577; John Smith's "True Travels, Adventures, and Observations," 1630; Gabriel Thomas's "Historical and Geographical Account of Pensilvania and West-New-Jersey," 1698 (McKee's copy sold in 1902 for $805). Among other books are Langland's "Vision of Pierce Plowman," 1550; "The nyne fyrst Bookes of the Eneldos of Virgil," translated by T. Phaer, 1562; "Hamlet," the undated edition (about 1636), "Printed by W.

S. for John Smethwicke" (the Perkins copy sold in 1889 for £60); Milton's "Paradise Regained," 1671; Coryat's "Odcombian Banquet," 1611; Chapman's "May-Day," 1611, and "The Widdowes Teares," 1612; a fourteenth century manuscript on vellum of that early English poem, "The Pricke of Conscience," by Richard Rolle of Hampole. On May 10 and 11, Sotheby offers part of the library of W. Bromley-Davenport. A manuscript "Speculum Humanæ Salvationis," of fifteenth Century German execution, several manuscript Books of Hours, and a manuscript Breviary are included. Among the printed books are several original issues of Savonarola's writings, early editions of the classics, and an imperfect copy of the rare first edition of the Book of St. Albans. On May 16, Sotheby sells the collection of book-plates formed by the late W. W. Robinson. An American plate of Steph: Apthorp, engraved by N. Hurd, not mentioned by either Allen or Fincham, and not in the Franks collection, will be offered.

At the sale of Part IV. of Ex-Gov. Pennypacker's library by Stan. V. Henkels in Philadelphia on April 24 and 25, a copy of Loudon's "Narratives of Outrages Committed by the Indians in Their Wars with the White People," 2 vols., Carlisle, Pa., 1808, Vol. I. fine and clean, but Vol. II. somewhat worn by use, brought $270; a Tory tract, printed in New York, probably by James Rivington, 1774, with the title "A Dialogue between a Southern Delegate and His Spouse, on His Return from the Grand Continental Congress," $100.

At Sotheby's, April 20, the Mildmay First Folio Shakespeare, a small copy, the title cut around and mounted, the verses and three other preliminary leaves lacking, brought £680; the second folio, the rare Richard Meighen imprint, £230; Spencer's "Faerie Queene," 1590-96, both parts, £150.

Correspondence.

HOW TO LEARN TO SPELL.

To the Editor of The Nation:

Sir: I hope that no Gentleman of the Old School—of the District School that was—will chance upon that tragic catalogue of errors, the "Report on the Examinations in English for Admission to Harvard College." We have heard it so often—the story of the "spell down"; and we know how scornful the Old Gentleman would be of the list of 120 words "commonly misspelled by candidates for Harvard." "*Exaggcrate! separate!*" he would scoff. "What words are these! Give me to spell *phthisic, ecumenical,* and *metempsychosis!*"

The Old Gentleman himself was a wonderful speller, no doubt; for there were good spellers then as there are good spellers now. There may have been, as he would have us think, better spellers then than now, and if there were, there were poor spellers also. How could it have been otherwise in the days of the "spell down"?

What must necessarily have been the effect on the sensitive ear of the countless misspellings heard in the course of an afternoon given over to the spelling match? A difficult word spelled correctly once would be misspelled a dozen times. The good speller of those days was truly a "survivor." He clung with desperation to the correct spelling, repeating it over and over to himself until "his turn" came, and stopping his ears to the misspellings about him. But what of the "unfit"? Did they ever learn to spell, or only to misspell? Unfortunately, we have no report on the Examinations in English for Admission to Harvard College for the year in which the Old Gentleman and his fellows presented themselves.

How are we to teach spelling? I think the question should be supplemented by, How are we to avoid teaching misspelling? The generous old "spell down" taught both! I have a suggestion to make, for the value of which I cannot vouch. To me, however, in the flush of invention, it appears reasonable.

If I were a teacher of spelling, I would never ask a pupil to spell a word which had not been spelled for him, and I would not expect a pupil of mine to write correctly words which he had not thoroughly learned by copying them in his own handwriting. Once let a student spell a word *incorrectly*, once let him have *in his own handwriting* an incorrect image of the word, and he is lost. I spelled the word *perhaps* with a final *e* for months, simply because the idea once got into my head that the word was so spelled. And the knowledge that it really had no final *e* had very little to do with the case. Spelling is a matter of first impressions and of habit, not a matter of "knowledge." So, if I were a teacher of spelling, I would pronounce and spell each word for the pupil, and then I would ask him to pronounce it and spell it. Before taking up a new word I would write the other on the blackboard in a conventional round hand (no teacher of spelling should write a "lawyer's hand"), and then I would ask the student to write down the word in a notebook, copying it from the blackboard, with the sound of the word still in his mind and associated with the visual image. Once let the student *hear* a word *correctly*, once let him *see in his own handwriting* a correct image of the word, and misspellings will find it difficult to gain entrance. In *his own hand* is, I think, highly important. We *recognize* a word by its word-sound and by its visual printed image, but in *creative* work it is the visual image of the word in our own handwriting which should immediately suggest itself. And, we may add, the hand as well as the eye learns this particular form of the word.

It follows that I am opposed to early original composition. To ask a child to write essays before he has the words, as visual images, to use, is as stupid as to ask him to write before he has ideas to express. In place of the original composition I would have him copy short, suitable essays. Indeed, there is no hurry about composition work. The student might far better learn to read well before attempting to create. Certainly, he should not be permitted to write ambitious misspelled themes.

I am aware that much of what I have said is heretical. I am as fully aware that up-to-date methods and devices are unsatisfactory. Has any teacher of spelling attempted to get his pupils to learn words *as imaged in the pupils' own handwriting?*

Richard R. Kirk.

University of Michigan, Ann Arbor, April 15.

WASHINGTON AS A UNIVERSITY SEAT.

To the Editor of The Nation:

Sir: It might be of some interest to add a few words to your comprehensive summary, of April 18, of Washington's fitness as the seat of a great university. Observation for several years here in connection with educational work brings some modifications of view as to the special advantages that this city might offer in the way of valuable collections and repositories. As you clearly indicate, while these aids for study are abundant here, it is not at all apparent that they will generally be of special service to a university, as they can hardly be utilized by any except the most advanced graduate students. For regular teaching purposes there would have to be university museums. The public ones, as at other points, would have to be opened to the general mass, and no special class could be accommodated. There are finely equipped laboratories here but they are usually devoted to applied science in the solution of some definite problem. Even if open to the classes, could these young men and women get any good from them? Such students will be learning principles, not the technical applications of them. It is hardly more probable that beginners would be allowed to use the apparatus than that the political science seminary would be admitted to cabinet meetings as an object lesson in government.

On the humanistic side, there are vast stores of books, but every educational plant has to have its own working library for the daily use of its force. It would be impossible to rely upon the public libraries for such purposes. The law library of Congress, one of the completest in existence for our statutes, is already restricted to members of the bar. As for the manuscripts and unprinted documents, of which, as you said, there are many thousands here, a student would not be in much superior position to his fellow at Harvard or Yale or Chicago. Use of such original sources scarcely comes until towards the end of the graduate period and is largely carried on during vacation. After a trip of a few hours a man from a distance would be placed on a level with the one here. Furthermore, as you point out, there are data of the most important sort in New York, Boston, San Francisco, and other places. It is just as likely that an investigator here would have to go to some other point as a man from elsewhere would have to come here.

It would minister to our national pride and stir our patriotism to have at our capital a great university such as at Berlin and Paris and Vienna, but the need of a costly outfit would be all the sharper because of location here. There is something to be said in the way of creating an impression upon the ordinary person. What would make an institution architecturally prominent for the average city would scarcely be a respectable beginning in Washington, with its imposing governmental edifices. The movement for creating a great institution here is one to be heartily commended but

it requires large sums to make it worthy of the city. Nothing less than $10,000,000 should he considered and the aim should rather he for $20,000,000 or $30,000,000 if the result is to he in keeping with the demands. Above all other of our centres, Washington can nationalize us, and broaden our outlook. There is no other equal body of people so representative of every nook and corner of our land. The public buildings and their contents of course cannot he duplicated elsewhere. All students visit them, and a few would get raw material from them for a thesis or other contribution to knowledge, but the solid, substantial elements of education, both for equipment and instruction, will have to he supplied by the institution just as at any other institution in a large city, and that means an enormous endowment if the first rank is to he attained. "E. O."

Washington, April 25.

AIMS OF THE CARNEGIE INSTITUTION.

To the Editor of The Nation:

Sir: One would naturally suppose, and as a matter of fact the opinion is widely held, that the Carnegie Institution of Washington is, or was intended to he, a great democratic foundation, to which scientists from the whole country might apply for assistance in carrying out projects with which for financial reasons they were unable to cope unaided; and that applications would he considered and granted with the same impartiality as is shown by the Civil Service Commission in making its appointments. As a matter of fact, according to the policy outlined in his last report, practically the only applicants that President Woodward proposes to favor are "eminent investigators" of established reputation; that is to say, scientists who from the very fact of their eminence already have at their disposal the best libraries, the best laboratories, the most efficient assistants, in a word, the best facilities that the country has to offer. The institution, the report goes on to say, cannot he "hampered by a host of applicants backed by endless recommendations of doubtful validity." In accordance with this sentiment the institution does not hesitate to inform applicants, even before a description of the project and a statement of the amount desired have been received, that their requests will hardly he granted, "no matter what the merits of the project." It is with something of a shock that the great scientific public, which supposed that the benefits of the foundation were to accrue to all, finds itself referred to as "hampering" the administration by sending in applications which it believed the institution would welcome, even though the lack of unlimited resources might render the rejection of many worthy projects necessary.

The arguments brought forward against the less known investigator and the applicant for a minor grant make it clear that the favored class is to consist of those who ask for large appropriations and those who need no further recommendations than their own names. The applicant for a minor grant is informed:

> These periods [of affiliation] will be from two to five years, or more, since few investigations well worth undertaking by the institution can be brought to satisfactory conclusions in shorter periods of time.

If this utterance is to be taken seriously, it means that the person who completes more or less of the preliminary work of his project before applying to the institution is a less desirable candidate than the person, who, by virtue of having done no preliminary work, can extend his affiliation with the institution over a period of from two to five years; and that, likewise, the man who defrays himself a part of the expense attendant upon his investigations and who accordingly asks for a comparatively small amount, is less worthy of assistance than the one who proposes to do all his work at the expense of the institution.

Research and not education must remain the primary object of the Carnegie Institution. But this principle presents a strange appearance when converted into an argument against any one class of applicants. Neither the size of the appropriation, nor the length of time required to complete the investigation nor yet the possible educational effect of the grant will appear to the public as considerations of any great weight in comparison with the simple merit of the applicant and his project. H. Z. Kip.

Cambridge, Mass, April 23.

THE STATE UNIVERSITY OF MAINE.

To the Editor of The Nation:

Sir: The Maine Legislature, having made an appropriation for the support of a college of liberal arts at the State University, has temporarily disposed of a question of broad educational interest. That question is whether a State should employ public funds to found and to maintain institutions to compete with those already adequately supplying the needs of the State on private endowment. The State College, which was one of the many established on the funds from the Morrill land grant, at first confined its teaching to agriculture and technology, for which it was founded. Later, after having induced the Legislature to change its name from college to university, the institution declared that it should live up to its name, and called on the State to make appropriations for the support of schools of forestry, pharmacy, education, and law. To all this there is no widespread objection. But in demanding the public funds for a college of liberal arts leading to the degree of A.B., the State University has met determined opposition. The Committee of the Legislature on Education reported against the A.B. course 7 to 2. The House favored it by a large majority, and the Senate at first opposed it by a small minority. The case against the contentions of the university is based on the generally admitted fact that the three colleges, Bowdoin, Bates, and Colby, all older than the Orono institution, are adequately supplying the needs of the State without resort to public funds. Many college authorities throughout the country maintain further that it is impossible to tack onto an agricultural and scientific institution, at the slight additional expense called for by the Maine University, a course in liberal arts which is at all equal to that provided at an institution with an endowment of over a million dollars, which devotes its whole life and resources to that one purpose.

The opposition is not based, as has been asserted, on the jealousy of the colleges, and it is unfair to charge them with obstructing the progress of higher education. They have held aloof from united opposition, although agreed on principles, and from that kind of lobbying which, in the history of State universities, has been a sorry spectacle. President Hyde of Bowdoin particularly has held consistently by his declaration that such questions are State matters, to be decided by all taxpayers, and not petty conflicts between institutions which should be working together for common ends.

The State of Maine cannot afford to spend the meagre funds now available for education in supporting a college of arts which, at the very best, can only duplicate what is already offered freely in other and older institutions. The State has crying need in her common and normal schools for all available funds. Her own teachers are publicly deploring the fact that the State has not yet paid the office of State superintendent of schools enough to secure a man who is both honest and efficient; that, in salaries paid to teachers, she competes for last place with four States in the black belt of the South; that the average salary paid to women in the elementary schools is less than $200, about half the amount paid for unskilled labor in her cotton mills. Maine has not a dozen men in her public schools receiving even the average salary paid to men teachers in Massachusetts. In view of these facts, it is no wonder that there is some bitter opposition to the officers of the university, lobbying for public funds, and advertising in the papers of Massachusetts to secure boys to take an A.B. course at the expense of the taxpayers of Maine.

Those who oppose the present policy of the university and the Legislature hold that the State should first take care of its public schools; second, that it should spend all that it can spend wisely in strengthening the agricultural and technical departments, now insufficiently supported at its State University; that it shall thus make what restitution it can for the misappropriated funds of the Federal Land Grant. The contention is, in short, that a State should be liberal in its support of all kinds of educational institutions which the people need, which they can afford, and which are not already provided freely and adequately through private enterprises.

William Trufant Foster.

Bowdoin College, Brunswick, Me., April 19.

THE CHRONOLOGY OF MASOLINO

To the Editor of The Nation:

Sir: Three prejudices have, I believe, darkened the problem of the relationship between Masolino and Masaccio: the acceptance of the dates 1428 and 1435 for Masolino's frescoes at Castiglione d'Olona, the search for the origin of his art only in and around Florence, and the general assumption that he taught Masaccio without being in turn taught by him.

Of these misconceptions the most disastrous has been the first. His earliest known frescoes have been regarded as his very last. This has prevented the per-

ception of the sure and gradual growth of one of the most studious, far-travelled, sensitive, and winning painters of the Renaissance. The date of 1428 in the famous inscription on the tympanum of the portal of the church at Castiglione, it may be said once and for all, neither refers to the frescoes within nor represents the time in which they were painted, nor yet the time when the church was built. The important word in the inscription (see Crowe and Cavalcaselle) is *perfecit*, which normally means "completed," and not "erected." The rose window, the tympanum—one too suspiciously new-looking to be contemporary with the date it bears—and, indeed, the whole doorway, are later than the façade, as is evident from the manner in which the portal-head cuts sharply across the segment of masonry representing a wheel-window still older than the present one. Finally, ancient records of the Branda family at Castiglione prove beyond question that the present church, as the restoration of an older one, was ready for consecration as early as January 7, 1422—the probable date of the vaulting frescoes. And at this time, it may be said in passing, Masolino had already reached the respectable age of thirty-eight.

As for the numerals MCCCCXXXV in the apex of the interior arch of the baptistery, no alleged date ever had less in its favor; it is in ugly modern letters and ugly modern house-paint, is clumsily set on one side of the arch crown, and is in character wholly contradicted by the authentic signature of Masolino in the church: the latter is a signature without date, in fair, large lettering, artistically and conspicuously placed, as though with a kind of honest pride; the other is a detached date without signature, in small, unpleasant letters, smuggled into an out-of-the-way position. Perhaps the modern restorer who ruined the coloring of the baptistery frescoes, finding faded traces of an inscription, reconstructed the date erroneously, it may be by inserting an additional X; or, if he did so correctly, it must refer to an early repainting or restoration, perhaps by Masolino himself. This latter theory has considerable support from two facts: certain figures in the scene of St. John Preaching were manifestly altered soon after the original painting; the fine nude figures in the scene of the Baptism, besides destroying the primitive symmetry of the composition, show an art far in advance of all the other frescoes, and equalled only once in the lower and later scenes of the church, by unknown authors.

Surer, however, than these external evidences are the internal ones. To those who, like myself, believe that Masolino about 1428 painted a part of the frescoes of the Brancacci Chapel at Florence, after executing most of those in the Capella della Passione at S. Clemente, Rome, no date ought to seem more preposterous than this 1435. For we should then have the unparalleled case of an artist who had mastered the proportions of the human figure, attained sure and pleasing effects of relief, subdued the extravagances of a decorative and picturesque style, achieved truth of composition and a sure knowledge of perspective and spacial effects, and arrived at an art mature in every way, suddenly relapsing to primitiveness in the very simplest elements, not merely of expression, but also of his craft. That a painter's hand may fail him in his dotage, and his work become slovenly and weak, is natural enough, but so sheer a regression is impossible. Besides, the frescoes at Castiglione, though relatively very inexpert, show not the hand of age, but the fresh, firm touch of a young man eager to learn, who had made enormous advances upon his work in the choir-vaulting of the church. The baptistery frescoes must therefore be somewhat later, several years perhaps, but both must antedate both the Roman and Floreutine works of Masolino. This, I think, nobody who discards the dates which have been unhappily attached to the Castiglione d'Olona frescoes and studies the work in itself, will deny. That Masoliuo's long sojourn in Lombardy was not without decisive influence on his later art, is a theme that the writer means to develop elsewhere. PHILIP J. GENTNER.

Rome, April 4.

T. A. TROLLOPE ON VITTORIA COLONNA.

TO THE EDITOR OF THE NATION:

SIR: T. Adolphus Trollope's essay on Vittoria Colonna and his translations from her poems are, to my thinking, quite worthy of the favorable comment bestowed upon them by S. W. Hatheway in the *Nation* of April 25. Trollope does not give the impression of having delved long and deep, but he seems to have lived a while in Vittoria's age, and, on returning to his own epoch (1859), to have recorded his observations before they had had time to be dulled by excessive meditation. Trollope is one of the many writers on Vittoria whom Mrs. Jerrold has not mentioned in her book, "Vittoria Colonna"; if this were not proved by her index, it would be evident from the fact that she has not assailed his heresies or attempted to impugn the authenticity of various pleasant anecdotes over which Trollope lingers with a fine sense of what is delightful, whether it's true or not. Brilliant books are certainly not always truthful, but it is equally certain that dull books never are; they seem simply to prove that some one has erred as to his (or her) capacity. Mrs. Jerrold's biography of Vittoria Colonna contains, as the *Nation* has said, some excellent translations. H.

Bryn Mawr, April 28.

THE LESSONS OF SELF-GOVERNMENT.

TO THE EDITOR OF THE NATION:

SIR: In your issue of April 18 you suggest that Lord Cromer's wonderful success in Egypt "may become the best object lesson the world has had that no goverument, however admirable, is so good as self-government." It seems to me that this lesson is human as well as national. The George Junior Republic, for instance, demonstrates that with boys, as with races, character is better formed by liberty of choice and the natural consequences of mistakes than by the military methods of most reformatories.

A militant civilization is as bad as a militant Christianity. Civilizaton by contact and civilization by commerce are good, but civilization by compulsion or by conquest develops dependence, as well as rancor and reaction. For this reason India and Egypt, under the most intelligent tutelage the world has ever known, seem to be less fit for self-government than the republics of Central America and South America. FREDERIC ALMY.

Buffalo, N. Y., April 22.

Notes.

McClure, Phillips & Co. will publish this spring a new work on William Blake, "The Real Blake," by Edwin J. Ellis, who with W. B. Yeats edited the first full edition of the poems. It is an elaborate biography and contains many illustrations. Mr. Ellis pays his compliments to his predecessors in the study of Blake, not omittiug John Sampson, the recent editor.

The Macmillan Co. will soon have ready Frederic Harrison's "Creed of a Layman: Apologia pro Fide Mea."

Wilfrid Blunt will soon publish, through Fisher Unwin, "The Secret History of the English Occupation of Egypt: a Personal Memoir of Events." The work is said to be notable for its candor. It gives, from confidential native sources, an accurate account of the national Egyptian movement of 1881-2, aud also lays bare the political and financial intrigues in Europe which led to English intervention and the military occupation of the Nile.

To the list, already long, of important French studies of English literary topics must be added Dr. Maurice Castelain's life of Ben Jonson with a critical edition of the "Discoveries" (Hachette & Cie.).

New editions of Fiona Macleod's early books, "Pharais, a Romance of the Isles" and "The Sin Eater and Other Tales and Legends," will soon be issued by Duffield & Co.

The alumni of the City College of New York will publish some time in June, through G. P. Putnam's Sons, a memorial history of the institution. There will be contributions by such graduates as Everett P. Wheeler, Russell Sturgis, Adolph Werner, President Ira Remsen, Robert Abbe, and Julius M. Mayer. President Finley and Edward M. Shepard write of the present state of the college and of its future. The general editors are Philip Mosenthal and Prof. Charles F. Horne.

Scribners issue a volume of "Baccalaureate Addresses and Other Talks on Kindred Subjects," by President Hadley of Yale. Most of the volume is made up of talks to students, but at the close are added three talks addressed to a wider range of hearers, on moral questions connected with educational work. The tone of the book is wholesome and optimistic, but one must confess that it deals largely in platitudes.

The first number of the *Albany Review*, a successor of the *Independent*, is now published by John Lane Company. It is largely political, with a department of Current Events, and with such articles as "The Lords and the Referendum" by Harold Spender, "Ritualism and Disestablishment" by G. W. E. Russell, and "The Work of

the Health Visitor" by G. F. McCleary. Literature is represented by poems of Thomas Hardy and G. K. Chesterton, aud by Andrew Lang's paper on Mark Twain's Autobiography.

The second volume of "The Oxford Treasury of English Literature," edited by G. E. Hadow and W. H. Hadow (Oxford University Press), continues the plan of the first. The subject is the Growth of the Drama, and, under the heads of Tragedies, Comedies, and Histories, selections are given ranging from the Miracle Play of "Abraham and Isaac" down to Ford's "Perkin Warbeck." A few long, rather than many short, extracts are chosen, aud this method, where the drama is to be represented, is almost necessary. There are general Introductions and brief biographies for the use of students. Though there is nothing of the common textbook in the external appearance of the book, its place is in the schoolroom rather than the library.

Arthur C. Benson's latest book, "Beside Still Waters" (Putnams), is tbrown into the form of meditations and recollections of a man who, after a busy life, settles down into a kind of epicurean seclusion from the world. "He found a small, picturesque, irregularly-built house crushed in between the road and the river, which, in fact, dipped its very feet in the stream; from its quaint oriel and gallery, Hugh could look down, on a bright day, into the clear heart of the water, and survey its swaying reeds and poising fish. The house was near the centre of the town; yet from its back windows it overlooked a long green stretch of rough pasture-land, now a common, and once a fen, which came like a long green finger straight into the very heart of the town [Cambridge]." Could a better lodge be found for a recluse who likes to season his days of solitude with an occasional dinner in Hall with his old college friends! And presently the college takes him back into its fold, while the house by the waters is kept as a place of retreat and quiet work. As for his printed reminiscences, they bear the stamp of being in considerable part autobiographical, and are but a continuation of Mr. Benson's "Upton Letters" and "From a College Window." They remind one of "The Private Papers of Henry Ryecroft," graceful and wise and sober, a delightful refreshment in the bustle of modern literature, but lacking the last incalculable touch of style and insight that make Gissing's book so memorable. It would be a pleasure to point out some of the passages that show Mr. Benson at his best, passages on religion and life that are filled at once with a brave skepticism and a kind of wistful faith. Perhaps the page on which he compares the Platonic and Aristotelian types of mind to the great centripetal and centrifugal forces of nature, would be the worthiest of quotation, if there were space for that pleasant art.

"Ireland," described by Frank Mathew and painted by Francis S. Walker (The Macmillan Co.), which was noticed in these columns two years ago, is now issued in a slightly smaller edition with half the illustrations and at less than half the price of the first edition. Mr. Mathew's text is pleasant reading for one who prefers the picturesque side of Irish life to its problems. Mr. Walker's pictures are admirably reproduced, but their coloring gives no true impression of Ireland's tender greens and browns and grays. The Irish sun shines cold or not at all. Under such glowing skies as Mr. Walker imagines, with such southern color and warmth, with her bleak gray coast towns vivid as Naples, Ireland would be the playground of Europe and America, and her troubles would wear a very different complexion.

In "The Tariff and the Trusts" (The Macmillan Company) Franklin Pierce, of the New York bar, deals vigorously with the subject of our Trust-breeding tariff. For a decade past there has been so little incisive discussion of the subject that one is disposed to welcome any book that speaks plainly concerning the abuses of Dingleyism. Mr. Pierce shows clearly that many of the Trusts owe their very existence to the tariff, and that most of them profit greatly by the high duties imposed on competing foreign products. Particularly instructive is his account of the manuer in whicn the Dingley act sneaked into an innocent looking paragraph in the "free list" a duty of from 150 to 250 per cent. upon Russian petroleum. And yet we suppose that our politicians and their "experts" will go on proclaiming that there is no connection between the tariff and the Trusts, and pointing to the Standard Oil Company as proof of that proposition. It caunot be said that Mr. Pierce's book is of great value to the student, but for the general reader it should serve a useful purpose. The author is at his best in the chapter which discusses the relation of protective tariffs to public morals.

"The Federal Power over Carriers and Corporations," by E. Parmelee Prentice (The Macmillan Company), is a vigorous onslaught upon the constitutionality of current proposals for Federal control of corporations. Mr. Prentice believes that the Constitution, in the year of grace 1907, "speaks not only in the same words, but with the same meaning and intent with which it spoke when it came from the hands of its framers." He contends that the right to engage iu foreign and interstate commerce is not derived from the Federal Government, but is "part of the inalienable liberty which . . . has a higher source than the Constitution itself." The "commerce clause" of the Constitution, in this view of the case, merely gives to Congress "the simple power of regulating trade" for the purpose of police control, and to attempt more than this is declared to be usurpatiou, pure and simple. Upon this theory Mr. Prentice reviews recent legislation and proposals for legislation, aud finds much occasion for alarm. He has stated his case with great vigor, but we believe that his argument will not carry conviction to many readers. That our Constitution to-day means, as a matter of fact, precisely what it meant to its framers, may be a convenient legal fiction, but it is very far from being true. That both Congress and the States are impotent to deal effectively with corporations engaged in interstate and foreign commerce may seem to accord with the intentions of the framers of the Constitution, and may be a comforting doctrine for our great financiers; but there is not the least prospect of its being adopted as a working theory of constitutional construction for the twentieth century. Mr. Prentice's arguments, in fact, remind one of the arguments advanced fifty years ago to prove the unconstitutionality of every effort to limit the growth and power of slavery. For some students of constitutional theories they may have their interest; but to the elucidation of the practical questions now before the country they contribute substantially nothing.

The chief reason for the preparation of "American History and Government" (Longmans, Green & Co.), is stated by the authors, Professors James A. Woodburn and Thomas F. Moran, to have been the desire to combine in a single grammar-school textbook the related subjects of American history and civil government. We are unable to discover, however, that the combination consists of much more than the interpolation, just after the account of the adoption of the Constitution, of seven chapters descriptive of the skeleton of national and State governmental forms. The government of cities, towns, and counties is not described at all, though chapter xix., on "The States and Local Government," constantly refers to its importance; and the abundant opportunities presented by the constitutional period for instruction in civics are little availed of. So far as the announced purpose of its authors is concerned, accordingly, the book cannot be adjudged successful. The historical narrative, while devoid of literary merit, is, as a whole, accurate and well proportioned, and shows skill in selecting important incidents. We note a few errata that should be corrected. The Acadians were not "governed in an oppressive and tyrannical manner" by the English (p. 106). The order of events in the paragraph, p. 132, treating of North's conciliatory resolution, is mixed, the rejection of the resolution by Congress following some time after the other incidents mentioned. The paragraph on page 137, purporting to be a quotation from the "Declaration of Causes," is not "the words of Congress," as the succeediug paragraph asserts, but a crude jumble of paraphrase and excerpt. Of course, the authors are aware that we have the common law in this country, and not simply Federal and State constitutions and statutes (p. 220).

Prof. Gonzalez Lodge of Teachers College has presented before the Classical Association of the Middle States and Maryland the result of his investigations of the vocabulary required for the easy reading of secondary school Latin, in the form of an annotated list of two thousand words occurring five or more times iu the usual secondary school texts. The list, together with suggestions for its use, as the best means of attaining an ability to read Latin at sight, is being printed. Professor Lodge has completed for publication by Teachers College an exhaustive vocabulary not only of these two thousand, but of all the words used in secondary Latin texts. It will be remembered that Professor Lodge first presented his general plan in the *Nation* of August 30, 1906.

Prof. Albert Harkness, a veteran editor, has published, with the help of two competent assistants, Prof. J. C. Kirtland, jr., of Exeter and Prof. G. A. Williams of Kalamazoo, an edition of nine orations of Cicero (American Book Co.). The notes are

terse and helpful; a useful feature is the suggestion of special topics, grammatical and historical, to be considered with each chapter of the text. The introduction is somewhat too long; the account of Cicero's philosophical works goes into needless detail. Most of the illustrations accompanying the text might have been relegated to the notes; one of them presents an object that archæologists will be interested to see —the "Wall of Romulus."

A recent publication of Longmans, Green & Co., is an "Illustrated First Conversational French Reader," edited by T. H. Bertenshaw of London. The method of the author is founded on common-sense: to supply, as in the old-fashioned spellers, a "list of words for learning by heart," and to arrange the material so that teacher and pupil may begin with simple phrases, pass to simple sentences, and by questions and answers hammer repeatedly on a dozen of the commonest irregular verbs. The text is equipped with diacritical marks indicating *liaisons*, there are many interesting illustrations, but much of the subject matter is not French.

A good deal of praise should be given "Karl Heinrich," by Wilhelm Meyer-Förster, edited by Herbert Charles Sanborn, and published by Newson & Co. To begin with, the story, a tale of student-life, at Heidelberg, is wholesome and refreshing, and in its mechanical make-up—the most beautiful of modern German type, many vignetted illustrations cleverly set into the text, a good autographic portrait of the author, and a cheery cover in colors—it is a radical and good departure in text-book manufacture. There is a carefully marked vocabulary, and not such an avalanche of notes as Mr. Sanborn put in his "Trompeter von Säkkingen." It is a question, however, whether notes at the foot of the page are desirable, and the German vocabulary should have been printed in full-face letter. There is a long introduction on student-life in Germany; and if numbers count for anything, the book should be well edited; for Mr. Sanborn acknowledges his special indebtedness to no less than nine persons, including Meyer-Förster, together with a *Schar* of students!

David Mair's "School Course of Mathematics" (Henry Frowde) is chiefly notable on account of its method. It undertakes to carry the pupil from arithmetic through the elements of algebra, plane and solid geometry, and trigonometry, by means of a sort of dialogue between the teacher and the pupil. Every discussion begins with some concrete problem of life, whether of work or of play, and the propositions are arrived at by a mingled process of guessing, measuring, and thinking. It differs as much as possible from the usual method of building upon a set of postulates explicitly chosen in advance. As a preliminary or auxiliary to the established way of teaching mathematics, Mr. Mair's procedure is very valuable or even indispensable, but as a substitute for the old way it must be regarded as a failure both on scientific and on pedagogic grounds. The book contains a vast multitude of ingenious hints, exercises, and devices that should be helpful to any teacher of secondary mathematics.

The Carnegie Library of Pittsburgh has issued in three bulky volumes a "Classified Catalogue" of all acquisitions down to 1902. It employs the decimal system, with fiction in a separate class after literature, and in many cases gives a brief description of the book. A general author and subject catalogue by alphabet follows. Later acquisitions will be included in supplements, and two additional volumes bringing the work down to January 1, 1907, are already in type. The library at that date contained about 242,000 volumes. These well-classified and descriptive catalogues are of great use to students and investigators throughout the country.

A supplementary volume has just been issued to the "Subject Index to Modern Works added to the Library of the British Museum since 1880," bringing the index down to the end of the year 1905. The original index, in three volumes, covered works added from 1880 to 1900. The preface announced that the work would be continued by the issue of three volumes in the years 1906, 1911, and 1916, and that in the year 1921 these would be incorporated in a complete index in a single alphabet for the period 1901-1921. The volume just issued is thus the first of the series then announced. It contains 51,800 entries and as the main work contains 155,000 entries, students have now at their disposal a classified list of 206,400 books, representing the recent literature of European and Western civilization.

The Association of French Librarians, organized about a year ago, has issued the first number of its official organ the *Bulletin de l'association des bibliothécaires français*. It is to be published bi-monthly, and its purpose is "to become the natural means of communication between librarians," to which end "it will receive with keenest interest the communications and articles which librarians will send; will publish studies by professionals in library economy and bibliography and help to bring about the success of reforms that are undertaken; it will endeavor to give all the news concerning libraries and librarians."

The sixth meeting of the Bibliographical Society of America will be held in Asheville, N. C., May 25-27. The programme includes an address by the president, William Coolidge Lane, librarian of Harvard; and reports of the committees on Incunabula, Americana, Colonial Newspapers, Colonial Laws, International Catalogue, Bulletin of the Society. The papers and discussions are "The First Presses of the Southern States," Florida, Mississippi, and Alabama, by Dr. Thomas M. Owen, director of the Alabama Department of Archives and History; North Carolina, by Dr. Stephen B. Weeks; South Carolina, A. S. Salley, jr., secretary of the South Carolina Historical Commission; Tennessee, Edwin Wiley, Library of Congress; "The Bibliographical Work of State Libraries," discussion opened by J. L. Gillis, president of the National Association of State Librarians, and California State librarian; T. L Montgomery, Pennsylvania State librarian; and G. S. Godard, Connecticut State librarian; "A Handbook of Special Collections in American Libraries," discussion opened by the president of the society, joint author with C. K. Bolton of "Notes on Special Collections in American Libraries," Cambridge, 1892; C. W. Andrews, librarian of the John Crerar Library, Chicago; N. D. C. Hodges, librarian of the Cincinnati Public Library; and Dr. E. C. Richardson, librarian of Princeton. The American Library Association and the National Association of State Librarians will also meet in Asheville, May 23-29.

A circular of the Delegation for the Adoption of an International Auxiliary Language states that representatives of more than 250 learned societies and professional associations are already enrolled, and that in the course of the present year they will proceed to choose an auxiliary language. They request the appointment of delegates from all learned societies and chambers of commerce. The committee for the United States consists of Dr. Percy M. Dawson of Johns Hopkins University, Dr. E. V. Huntington and Dr. Harry W. Morse of Harvard, and Dr. G. B. Viles of Ohio State University.

The report of the Ontario Ministry of Education for 1906 records 376 libraries in the province as reporting to the department. The total number of volumes is 1,157,696 and their annual circulation 2,481,080. The libraries have a gross annual income of $227,408, and gross assets valued at $1,596,639. Readers enrolled number 152,907. The report as a whole is confessedly imperfect, inasmuch as 108 libraries failed to send in any statistics. One unfavorable feature noted is the excessive proportion of current fiction purchased by library boards. To remedy this evil, it is recommended that the present loose method of classification whereby many works of fiction are classed as history, sociology, literature, juvenile books, etc., be abolished, that all novels of whatever kind be classed strictly as fiction, and that the amount of fiction to be purchased with Government grants be limited to 45 per cent.

The German Archæological Institute in Jerusalem, established a few years ago by the Eisenach conference, a convention representing all the different state churches of the empire, has made its announcement of the work mapped out for the coming season. Lectures are to be delivered by the head of the school, Prof. G. H. Dalman of the University of Leipzig, and by his assistant, Dr. Hugo Gressmann of Kiel, to be connected with tours for archæological research and special excavations on the site of ancient Jericho. For this latter work Prof. E. F. M. Sellin of Vienna, who has been the leader of the German researches in Palestine, has secured the necessary permission in the shape of a firman from the Sultan. The German school in Jerusalem has as its students chiefly graduates of German universities preparing themselves for an academic career, mostly for Old Testament chairs.

The Rev. John Fulton, D.D., died April 24 in Philadelphia. Dr. Fulton, who was editor of he *Church Standard* and professor of canon law at the Philadelphia Divinity School, was born in Glasgow, Scotland, in 1834, and educated at Aberdeen University. He came to the United States early in life, and at New Orleans in 1857 he was ordained priest of the Protestant Episcopal Church. In the course of time he came to New York and engaged in editorial work on the *Churchman* In 1892 he went

to Philadelphia. He was recognized as an authority on canon law, and was author of "Letters on Christianity" (1868), "Index Canonum" (1873), "Laws of Marriage" (1883), "The Chalcedonian Decree" (1890), and "Palestine." He had received honorary degrees from various colleges.

The death is announced of Max Haushofer, professor in the Technical High School of Munich. He was born in Munich, in 1840, and educated in the schools and university of that city. He was the author of more than thirty volumes, including "Lehr- und Handbuch der Statistik," "Industriebetrieb," "Der kleine Staatsbürger," "Grundzüge der politischen Oekonomie," "Der moderne Sozialismus," and "Die Landschaft," besides several volumes of verse.

BABYLONIAN ARCHIVES.

The Babylonian Expedition of the University of Pennsylvania. Series A: Cuneiform Texts. Edited by H. V. Hilprecht. Volume XX., Part I. Mathematical, Metrological, and Chronological Tablets from the Temple Library of Nippur. By H. V. Hilprecht. Volume VI., Part I. Babylonian Legal and Business Documents from the Time of the First Dynasty of Babylon, Chiefly from Sippar. By Hermann Ranke. Philadelphia: Published by the Department of Archæology, University of Pennsylvania.

Columbia University Oriental Studies, Vol. III. Old Babylonian Temple Records. By Robert Julius Lau. New York: The Columbia University Press.

From the beginning of their excavations, in 1889, the explorers of Nippur hoped to discover at that site an ancient Babylonian temple library. From time to time quantities of clay tablets were found scattered here and there through the mounds, and at some places collections or deposits of tablets; but these always proved on examination to be archives, the books and papers of some business house or of some department of the temple administration. Finally, early in 1900, the then field director, Dr. J. H. Haynes, discovered in the northeastern part of an isolated mound, separated by a canal from the ancient temple of Bel, a deposit, or collection, of tablets of such unusual size that he was led to hope that the library was at last laid bare. Dr. Hilprecht, "scientific director" of the expedition, arrived on the scene after these tablets, with the exception of a very few specimens, had been boxed for shipment. Without examining them, he forthwith wrote to the *Litterarisches Centralblatt:* "We have definitely found the Temple Library," and proceeded to describe the contents of the tablets, which he reckoned at 17,200. In his later, fuller, and more official publications he reckoned the number of tablets from this place, which he called "the school and the technical library," at 23,000 or 24,000. These were the "more scientific works, the tablets for religious edification and books of reference—mathematical, astronomical, medical, historical, and linguistic tablets—hymns and prayers, omens and incantations, mythological and astrological texts." To these he added, in his final reports on "the library," 28,000 tablets of archives from another series of rooms in the southwestern part of the same mound, which he called "the business and administrative department established in the 'library.'" He published eight specimen illustrations from the material found in "the school and the technical library," and one from "the business and administrative department." These two sections of the library were, according to him, destroyed somewhere about the close of the third millennium B. C. In the neo-Babylonian period a new library was established on the ruins of the older institution; and Professor Hilprecht described his discovery in this later library of a jar containing "about twenty inscribed objects, mostly clay tablets, which constituted a veritable small Babylonian Museum." Of the most striking and important object in this collection, an ancient clay map of the city and temple of Nippur, he published a photograph.

These publications aroused a violent controversy, which found its way into the discussions of the American Oriental Society, in 1905 and 1906, in formal papers impugning the honesty of Professor Hilprecht's statements. It was shown that not one of the nine objects represented in his specimen illustrations of the temple library had been found at the time or in the place stated by him. Three had been bought in Baghdad eleven years earlier and the other six had been dug up in other parts of the Nippur complex of mounds at periods varying from ten years to a few months before the supposed discovery of the library. The clay map which Professor Hilprecht asserted that he found in a jar in the "new library" was shown to have been found a number of months before he came to Nippur, in another part of the ruins. It was further proved that at the time of all these publications a large part of the tablets supposed to constitute the library had never been unpacked or examined; and that Dr. Haynes had packed all together the objects dug up by him at different times and in different parts of the ruin mounds, so that the determination of the exact locality of discovery, on which would depend the location of school rooms, technical, administrative, and business departments, was uncertain, if not impossible.

Such misrepresentations not only discredited the temple library theory and rendered it impossible to rely upon any statements in Professor Hilprecht's publications which could not be verified from the texts themselves, but also, in view of his official position, discredited American scholarship. Accordingly, no answer having been presented by him, in April, 1906, a number of the leading Orientalists of the country united in a letter, inviting him to make "a frank statement of the facts"; since the "recent controversy in the matter of the Nippur expedition has been left in a state which allows the gravest imputations upon the integrity of American scholarship to rest uncleared." His answer was to refer them to a volume which he was about to publish, and which would contain his answer to these charges. That volume is the one before us. From beginning to end it contains no answer to the charge of false statements and misrepresentations with regard to the library, but rather, bases its conclusions upon, and continues those misrepresentations.

On its title page the volume purports to be "mathematical, metrological, and chronological tablets from the temple library of Nippur," material which, according to Professor Hilprecht's former publications, was contained in the large "find" of tablets made by Dr. Haynes in the northeast portion of tablet, or library, hill. Plate I. represents the "school and library of the Bel Temple, east section," the rooms in which Dr. Haynes actually found the large collection of tablets referred to above. The apparent intention is to create the impression that the "mathematical, metrological, and chronological tablets" of the older period published in this volume were found at that place. The larger part of the tablets published in this volume belong, in fact, to this older period, the third millennium B. C. Of these, approximately one-half, as proved by their museum dockets, were found ten and eleven years before this "school and technical library" was discovered, and in another part of the mound, that which Professor Hilprecht has designated in his former publications as the "business and administrative department of the library." These tablets did not constitute one collection, but were found singly or in small groups scattered about in a number of different rooms, occupying a considerable space. As to the other half, we should like greatly to see any proof that they were actually found in the place represented on the plate. Somewhat less than half of the tablets published in this volume belong to a later period, the Cassite, in the second millennium B. C. According to their dockets these were all found in another group of hills still further removed from the temple, and across a very deep and broad canal from the hill which Hilprecht first called the library. (This group of hills he now seems to claim constituted the temple library in the Cassite period). These later tablets were discovered at different times during a period of ten years, and at a number of different places, scattered over a considerable extent of ground. They do not belong to any one large collection, or deposit, of tablets found in one place. As to the contents of the tablets here published, they consist of school exercises and examples, multiplication and division or common-divisor tables, with one fragment of a chronological tablet or calendar.

It is profoundly to be regretted that suspicion has been thrown on the value of the University of Pennsylvania explorations in Babylonia in general, as a result of the method pursued in the publication of the results of those explorations. The value of the entire material is impaired because of the lack of frank and honest statements with regard to the place of discovery and the environments of that material. Absolute good faith is an essential condition of scientific work. If that good faith is lacking in one particular, confidence in the whole is destroyed. One does not know what may be believed, or where the records may have been tampered with to change results. With this word of caution we must, unfortunately, preface our review of this volume.

So far as the actual publication of texts

is concerned, Professor Hilprecht's work seems to be admirably done. He is a master in the art of copying cuneiform inscriptions, albeit his efforts to represent accurately the injured portions are occasionally carried so far that the shading unnecessarily obscures the signs. The plates which reproduce a number of the more important tablets are beautiful specimens of photography. We could wish that, following the admirable example of the French explorers at Susa, the texts were accompanied by transliterations and translations. We could wish, also, that these volumes were somewhat more honestly and less grandiloquently numbered. This volume, which bears the number twenty, is in fact number seven.

The chapters of the text which precede the publication of the plates appear to contain material of much value, and especially Chapter II. With great ingenuity Professor Hilprecht has worked out the real meaning of the so-called multiplication tablets, which are actually division tablets, giving the common divisors of the number 12,960,000, the fourth power of 60, and the square of 3,600, the two fundamental Babylonian numbers already well known to us. But this number, 12,960,000, "which underlies all the mathematical texts here treated," is the famous number of Plato, which he calls "the lord of better and worse births," and which he derived, with part certainly of the theory connected with it, from Pythagoras. It is impossible here to follow out Professor Hilprecht's treatment and explanation of this number, and the part which it played in relation to the days of the year. The important fact is that he has established a new and far-reaching dependence of Greek thought and science on the thought and science of Babylonia, and traced the latter back to a remote period. This chapter seems to be a real contribution to the history of civilization, on which we heartily congratulate the author.

Another chapter of much interest is that which deals with the new chronological list, or calendar, mentioned above, only one side of which, however, has been so far deciphered and published. This gives us the names of some new kings and furnishes Professor Hilprecht with an opportunity to discuss the early chronology of Babylonia. He formally gives his adherence to the chronological theory now held by the great majority of Assyrian and Babylonian scholars, viz., that the proper date of Sargon I. is approximately 2800 B. C., not 3800. In other respects his chronological system as here developed is quite unique. He still maintains his belief in the immense antiquity of Babylonian literature, art, and science. Almost everything that was valuable belonged to the pre-Semitic period.

> Ancient Sumerian art and science have gradually degenerated under the Semitic invaders . . . compared with that highly developed civilization on the threshold of the fifth and fourth millenniums, the new shoots [that is, the developments of the times of Sargon, Hammurabi, Ashurbanipal and Nebuchadrezzar] are only miserable after-growths of a great period of independent creation long past (pp. 9-10).

Besides the tablets obtained by its own excavations at Nippur, the University of Pennsylvania has acquired Babylonian tablets from time to time by purchase. From these collections, Dr. Ranke, formerly curator of the Philadelphia Museum, publishes fac-simile transcriptions of 119 tablets, with thirteen plates of photographic reproductions, a list of the cuneiform signs used, a descriptive list of the tablets themselves, a concordance of proper names occurring on them and a brief introduction treating of their character and contents, with transliterations and translations of nineteen specimen tablets. From a study of the contents of these collections of purchased tablets, the gods mentioned, the names of contracting parties, witnesses, etc., and a comparison with similar collections of tablets in Berlin and London, it would appear that certainly the great bulk of them belonged to the archives of the temple of Shamash at Sippara; but as they were dug up by "thieving Arabs" it is impossible to determine exactly where they were found and how they were filed or stored.

They consist of contracts for the purchase of slaves, fields, houses, etc., leases, loans, adoptions, and the like, of court decisions, and of memoranda of various sorts, receipts, and lists. They are in general of a private character, but not a few of the contracting parties are temple officials, and this relation to the temple may account for their deposit in the temple archives. All date from the period of the first Babylonian dynasty, covering a period of about 250 years before and after 2000 B. C. Incidentally the names occurring on these tablets show a change in the governing element in Babylonia at that time. A people closely akin to the Western Semites of Syria and Palestine had obtained control of Babylon and were gradually undergoing amalgamation with the former population. At the beginning of the period the names are largely Western Semitic; at the close they have become Babylonian. Dr. Ranke notes a marked development in the character of the script during the period covered by these tablets. The language of the tablets is the Semitic-Babylonian, Sumerian surviving only in a few legal phrases. Among the most interesting of these documents are those dealing with the affairs of certain priestesses of Shamash.

Of a somewhat different character are the temple archives from Tello, the ancient Sirpurla, published by Dr. Lau. In the winter of 1894-95 DeSarzec, the explorer of Tello, unearthed two groups of galleries, containing large collections of inscribed clay tablets, estimated to number about 30,000, arranged in five or six layers, one above the other. In some manner these were plundered by the natives and a large number sold to the leading museums in this country and Europe, Columbia University acquiring 258 of them, which Dr. Lau has published in this small and handy volume. A little more than one-third of the tablets he has transcribed. These appear in fac-simile reproduction with a sign list and glossary. Prefixed to this is a catalogue of the entire collection, containing a description of each tablet and its contents. The introduction comprises translations of specimen tablets of the different categories which make up the collection. These tablets are genuine temple records, belonging to the administration of the temple. They give lists of temple officials, income lists of various properties, accounts with shepherds and herdmen, the number of sheep, cattle, and other animals cared for by each, the increase of flocks, loss by death, etc.; similar farming accounts; expense lists, showing the sums paid for the service or maintenance of various officials, the amount of grain, oil, wine, and the like requisitioned for messengers, weavers, and others; receipts for stores delivered to the temple, and much more of the same sort. The whole reveals an astonishingly minute system of accounts and records in connection with the temple administration, implying a high development of civilization. It is evident that the old Babylonian temples were great landed proprietors and business corporations, if one may use the latter term of what was pre-eminently an agricultural community. These tablets all belong to the time of the dynasty of Ur, when that city had the hegemony in Babylonia, somewhere about or after 2700 B. C.

These three volumes taken together cover a period of about 1,400 years, and the documents contained in them not only throw light on the administration of ancient Babylonian temples, but also illuminate the domestic and economic history of the country, admitting us as it were into the intimacy of the scholars, priests, judges, merchants, farmers, herdsmen, and artisans of the land. Intended primarily for Assyriologists, they contain material of the first value for the student of the history of mankind.

CURRENT FICTION.

The Country House. By John Galsworthy. New York: G. P. Putnam's Sons.

English fiction time and again busies itself afresh with a fruitful theme unknown and impossible in America—the modification of character resulting from long generations of entail and right of primogeniture. To this condition we owe such excellent comedy as Mr. Meredith's "Egoist" and the grotesque tragedy of Mr. Snaith's "Broke of Covenden." In "The Country House" Mr. Galsworthy enters the same field. The skeleton of his theme, however, is clad by a just and lively humor which softens his satire, and redeems his arraignment of society from an excess of bitterness. The scene lies in conventional London, and a dull county neighborhood, with its usual house party, cricket matches, and village church. There is shooting racing, hunting, the folly of young men; the usual setting, in fact, out of which such differing pictures have been evoked by Thackeray, Trollope, and the whole race of stable English novelists. As English society to-day is faster than in Thackeray's time, Mr. Galsworthy's young man and woman move at a quicker pace, but he treats their misdeeds with a reticence equal to that which veils the climax of Becky Sharpe's career, giving rather the effects of their actions upon the lives which they touch than baring the detail of a commonplace enough intrigue. George Penndyce's adventures merely form reflectors to show the characteristic development of his parents in time of stress. His racing debts really interest us far more for the sake of his father and mother than for himself, and for this there is classic precedent, since do we not all, on a like occasion, suffer with Plantagenet Palliser, Duke of

Omnium, rather than with his son, Lord Silverbridge?

The book contains some edifying comment upon English divorce laws, some delightful touches upon animals and country, and an undercurrent of sharp hostility to the rights of landed gentry and the cruel stupidity of sport. Nothing could be funnier than the lightly burlesqued picture of a whole community, which never moves without "the dear dogs" at its heels, or more delicately ironical than the hinted bond between master and spaniel—the unreasoning Conservative's attempt to keep himself in countenance by unbroken companionship with an uncritical admirer. The development of the story is workmanlike, plausible, and full of that moderation from which arises so much of the real irony of circumstance, the eternally collapsing heroics which make actual existence at once disappointing and plausible. And the whole is unfolded in a brisk, competent narrative, with savor and discretion, through the medium of a perfectly satisfactory style.

The Whirlwind. By Eden Phillpotts. New York: McClure, Phillips & Co.

Naturalism, in the hands of Mr. Phillpotts, is not content till it has discovered a sombre beauty in events however sordid, in characters however unpromising. "The Whirlwind" is a study of womanhood, as contrasted with feminine propriety or impropriety. The Sarah Jane of the story is, as judged by her fellows, simply a country girl who marries a good man and besmirches his honor. But Mr. Phillpotts interprets her as a woman whose purity and innocence of nature, whose very devotion to her husband, leads her to be what we are forced to call "unfaithful." She is pursued by a man who is in a position to give the husband rapid advancement of a material kind. Being half a gentleman, as well as half an invalid, he has no difficulty in winning the woman's regard. Her husband is her mate, and her love for him is strong and steadfast, but as she is herself neither passionate nor imaginative, she has no painful sense of sin in giving herself to a man whom she feels to be her own friend, and her husband's benefactor. Not that she yields out of mere Trilbyish goodnature, but out of half-maternal tenderness for one man and mistaken ambition for the other. The momentary sacrifice of her own preference seems a small matter. The man, having gained his point, begins a long penance of anguished remorse, from which a religious conversion finally releases him. The woman looks upon his sufferings with pity and a kind of wonder. He is as powerless to lift her to his religious ecstasies as he has been before to shake her simple faith. She has, indeed, that unconscious healthiness of nature which we are fain to call Pagan. She has a bounty, a massiveness of Mother Earth; she is not Eve, nor Magdalen, but Ceres. It is not she who has sown the wind, it is not she, one feels, who reaps the whirlwind. When, after many years, the ancient fault is brought to light, and she kills herself, the deed is done not in guilt or fear, but to spare her husband the torture, which she knows his stern nature will impose upon him, of being her executioner. As a study of these three characters—especially of this one, since seducing gentlemen and avenging yokels are so much more common—this is a remarkable book.

It is to be regretted that the writer did not more nearly confine himself to the main theme. The supernumerary persons—clodhoppers, dairy-maids, publicans, comic villagers—are too many and too much in the way. One talkative lady, a Mrs. Weekes, is to be added to the glorious company of Poysers. But the very full reports of rustic meetings, such as those of the committee on the "water-leat" celebration, are like George Eliot at her dullest. They give the impression of having been introduced less to round out the local setting than to serve as cheering interludes, to relieve the strain of the real narrative. But the strain of such a narrative does not need relief. The effect must be of cumulative horror, of firm-built tragic beauty, if may be. This at least would seem to be the method natural to Mr. Phillpotts. He should beware of flying kites upon his whirlwind.

The Quest. By Frederik van Eeden; the authorized translation from the Dutch of "De Kleine Johannes," by L. W. C. Boston: John W. Luce & Co.

The three parts of "De Kleine Johannes" were written at three different periods. The second part is all that a sequel may be, the third nearly all that it should not be. During his later years the author has more and more committed himself to propagandism, distinguishing himself as a writer upon socialism, and himself founding a socialistic brotherhood which now numbers several thousand members. All this has not served to increase his imaginative power. There is much jog-trot indeterminate narrative as well as much didacticism, in the third part, which to give a final edge to one's distaste for it, is nearly as long as the other two put together. But then it may very comfortably be ignored. The second part completes the tale—surely one of the most beautiful parables in modern literature. The quest of little Johannes inevitably suggests that other pursuit of Meister's, nor are minor points of similarity lacking. But the treasure which Johannes seeks is spiritual rather than intellectual, and he is guarded by a kind of pristine innocence, a purity born of idealism, from injury in his wayside encounters. His comrade and feminine complement, Marjon, though like Mignon, only a little circus girl, is able to protect him from herself as well as from the Philinas who cross their path, until the hour comes for their already wedded lives to be bound yet more closely. They are Youth and Hope setting forth upon the ancient pursuit of truth, and hardly conscious, in their ardor, of the fleshly impediments which oppress all but the purest of the sons and daughters of men. Yet these two are human. They embody, not merely suggest, and are engaging in their own persons. Marjon, to be sure, is not involved in the first part of little Johannes's adventures, and she is never admitted into that dream world which is the better half of his early experience, at least.

They are a wonderful company, these fairy creatures who arouse and discipline the child's eager quest: Windekind, the gay sprite, who sees no problem in the joyous face of things; Wistik, the philosopher goblin, always himself on the verge of the discovery of pure truth; Pluizer, malignant spirit of rational skepticism; nay, Death (a civil person), the Devil (an official who does his best), and Pan himself. In such terms the adventures of the boy-soul are recounted. Gradually, as time passes, human figures begin to appear more distinctly in the picture. The death of the father whom in his preoccupation Johannes has almost ignored, frees him from the domination of Pluizer; and Windekind, for whom he longs, leads him to one who walks upon the waves, and who promises to be his guide. So begins his contact with the every-day world, for (here Part Second begins) the guide leads him to a squalid town, where Johannes discovers him to be a scissors-grinder. A fair is going on, and he finds Marjon among the company of a wretched little circus. Thereafter she and Johannes, Markus the scissors-grinder, and a fourth, Marjon's monkey, are almost inseparable. Markus is, of course, a modern representative of the carpenter's son, and throughout the second part of the story a figure of dignity and sweetness. In the third part he becomes sententious, fanatical, a human being with a theory, not a divine guest. The scene in which he takes the occasion of a coronation ceremony to deliver a socialistic harangue is little short of ridiculous. We may better take leave of him, and of Johannes, with the impressive chapter in which, returning for the last time to the dream-world, we pay final honors to the dead Pan.

From Libau to Tsushima. By Eugene S. Politovsky. New York: E. P. Dutton & Co. $1.50 net.

As the Hague Ordains: Journal of a Russian Prisoner's Wife in Japan. New York: Henry Holt & Co. $1.50 net.

Eugene Politovsky was chief-engineer of Admiral Rojestvensky's fleet and went down with the Russian flagship Suvaroff in the battle of the Sea of Japan. His diary, faithfully kept from the October day in 1904, when the fleet set out on its ill-fated voyage, to within four days from the May afternoon when Togo's ships hove in sight near the Tsu Islands, has deservedly been called a valuable contribution to the history of the great struggle in the Far East. It holds material, however, which should be subjected to careful interpretation, in spite of the simple and straightforward manner in which the story is told. We have seen the book cited as authority for the utter incapacity and disorganization which is supposed to have reigned in the squadron that Rojestvensky guided to the Pacific as Russia's last desperate hope; and on the face of the narrative all that critics of the Russian naval campaign have brought forward against this "aggregation of naval junk" would seem to be justified. But bad as conditions undoubtedly were, there can be little doubt that we have, in the writer of the present diary, an officer of exceedingly nervous constitution, in whom the Russian gift for self-aspersion appears in exaggerated form. Where the Anglo-Saxon temperament would record a three hours' halt for the purpose of repairing a piece of defective steering gear, our Russian sees

doom, desolation, and vast abysses of inefficiency and corruption. There is no denying that nerves on the Baltic Squadron were in a bad state from the first day out. Even after the amazing Dogger Bank episode, they saw Japanese torpedo boats in the south Atlantic and Japanese balloons not far from Madagascar. But nerves did not keep the fleet from being worked well on the whole, or the officers from approaching what they knew to be their fate with a quiet courage totally at variance with their anticipatory hysteria over comparatively trifling things. Politovsky, after much peevishness and sick imaginings, writes under date of March 25 in a pleasing matter-of-fact way:

To-night a torpedo attack and to-morrow a battle are almost inevitable. I must put on clean clothes and lay in a stock of wool, so as not to be deafened by the firing.

To repeat, then, this armada which Rojestvensky led eastward, half through the Suez Canal and half around Africa, scarcely deserves the ridicule which has been bestowed upon it by judges after the fact. Hastily organized and badly equipped it undoubtedly was; its equipage consisted largely of insufficiently trained men, and—it was disastrously defeated. But to argue from this sole fact of total defeat is scarcely just, for the conditions of naval warfare, and especially modern conditions, are such as to render defeat generally synonymous with annihilation. The Russian admiral's inferiority to his Japanese opponent may be readily acknowledged, but Rojestvensky should receive full credit for the manner in which he brought his ships face to face with the enemy. From his chief-engineer's figures it would appear that, from the North Sea to the Sea of Japan, the division that went around Africa steamed about 18,000 miles in 107 sailing days. This for an agglomeration of all sorts of fighting craft is not far inferior to the famous record run of 13,500 miles in sixty-six days made by our own Oregon.

The inspiration for the title "As the Hague Ordains" was probably not unconnected with certain recent happenings in Carnegie Hall. The book offers a marked contrast in sincerity to the preceding volume. It purports to be written by the half-English wife of a Russian Colonel Von Theill, who is on the General Staff in Manchuria, and gets himself taken prisoner early in the war. His wife goes to Matsuyama, on the inland sea of Japan, to nurse her wounded husband back to health. She starts out as an intensely patriotic Russian, who almost forgets her sex in her hatred of the Japanese. But rapidly enough Japanese courage, kindliness, devotion, self-sacrifice, modesty, laboriousness, bodily cleanliness, artistic refinement, and sundry other virtues, work an amazing change in her, and she comes to see her dear Russians for the uncouth, loud-voiced, unwashed, uneducated, misgoverned, and vanquished creatures that they are. The device is clever, but rather too transparent; and we suspect that the wife of the Russian prisoner is more than half-English and wears trousers. Nevertheless, the "diary," which was demonstrably written after the facts which it foresees with remarkable clearness, makes vivacious reading, and there are bits in it of the traditional Japan of fine pottery and miniature gardening which are distinctly charming.

Science.

Herman von Helmholtz. By Leo Koenigsberger. Translated by Frances Welby. New York: Henry Frowde.

This volume, of absorbing interest, outlines a life which was intimately bound up in the life of the scientific world during the last century. To-day it is difficult to understand that when Helmholtz began his work on the functions of the nerves, and on the physiology of the eye, a well-known professor of physiology invited to witness a demonstration of retinal images could have said, "A physiologist has nothing to do with experiments, though they may be well enough for the physicists." Probably nothing was better calculated to dispel this idea than the discovery of the ophthalmoscope by Helmholtz in 1850.

He had previously made an investigation of the time required for any muscular or nervous stimulation to be transmitted over a measured distance. He was also prominent in developing the consequences of the principle of the conservation of energy, although he freely acknowledged in this as in other cases the priority of others who had independently reached the same result. During the latter part of his life Helmholtz gave most of his attention to mathematical studies in electricity and magnetism. Some of the most distinguished workers in this field were students in his laboratory. Among these was Hertz, who first found the conclusive experimental proof of the existence of electric waves, and pointed the way to the wireless telegraphy of to-day.

Some of his work aroused criticism. It was an age of polemics. But while he did not hesitate to give reasons for his own conclusions, he never allowed himself to play the part of an advocate. His own mental attitude is well represented by his remark:

It is unworthy of a would-be scientific thinker to forget the hypothetical origin of his propositions. The arrogance and vehemence with which such masked hypotheses are defended are, as a rule, the usual consequence of a sense of dissatisfaction which their champion feels in the depths of his consciousness as to the validity of his contention.

Not the least interesting feature of this book is the human element which it contains—the conditions under which this man lived and worked. At twenty-eight he was made professor and director of the Physiological Institute at Königsberg at a salary of £120. At this time he married. When he afterwards left Heidelberg, at the age of fifty, to accept a position at Berlin, it was to accept a salary of £600. Measured by the standards of the business world, his life was a failure. But his name will be held in reverence as one who has made the world his debtor. The possession of millions can never secure for any man the place which this man's inspiring life has given him. The account which Helmholtz gives, in a letter to his wife, of his visit to Faraday, shows what it was that appealed to him:

Those were splendid moments. He is as simple, charming, and unaffected as a child; I have never seen a man with such winning ways. He showed me all there was to see. That indeed was little enough, for a few wires and some old bits of wood and iron seem to serve him for the greatest discoveries.

Dr. Luther H. Gulick is nominally a physician and a director of physical training; in reality, he is by inheritance and practice a preacher, and a very good sort of preacher, too, as is shown by his little book on the "Efficient Life" (Doubleday, Page & Co.). A dedication to a great apostle of strenuosity and the presence of eight pictures of him may lead the reader to expect praise of this kind of life, but the author cares more for efficiency, happily defined so that each reader finds a personal application and opportunity, and he is careful to note that "sometimes the quiet life is more efficient than the strenuous one." Those who happen to have been brought up on the older books concerning the conduct of life—a certain book, whose reverend author shall pass unnamed, darkens even now the memories of the reviewer—will rejoice that a very different kind of advice is offered to the young men of this generation. Here is the praise of cheerfulness, of moderate and interesting exercise, of the joy of living; and a recognition of the right of the body to be duly considered. Dr. Gulick has no hobbies, and sees clearly that the things to be commended are those which the hearer may reasonably be expected to do and not over-refinements of bodily care and personal conduct impossible of general attainment. While his explanation of the physiological basis of his advice is not always quite sound the advice itself is usually eminently sane. His views on slouchiness as a common fault of American men, the folly of "predigested" things, the insidiousness of indigestion and its congeners, the danger of introspection, and the perniciousness of symptom-swapping, the importance of preserving a just balance between work and rest, the fundamental distinction between vitality and muscularity, these and many others deserve to be widely known and pondered. The author has even a kind word for stimulants and the "rarebit," with which, except for the spelling, we are in hearty accord.

"Nature's Craftsmen," by Henry C. McCook, is just published by Harper & Brothers. Dr. McCook is familiar to many of us as the author of "Tenants of an Old Farm," a book which, in some ways, makes the lives of the lesser creatures more real to us than does the work of any other writer on nature. As that book was adapted to boyhood, so "Nature's Craftsmen" appeals to more mature minds, and in a delightfully sane way recounts the joys, the sorrows, and the occupations of divers species of ants, bees, wasps, and spiders. The love of true men and naturalists for the objects of their study is shown in Dr. McCook's account of a visit to the house of Sir John Lubbock in 1887, when a queen ant which had been carefully studied for thirteen years had just died. After the interchange of greetings Dr. McCook asked Sir John about his royal pet.

"I have sad news to tell you," he answered.

"What! is the queen dead?"

"She died only yesterday. I have not

had the heart to tell the news as yet even to my wife."

After reading this book, we realize as never before the marvellous diversity of instinct among ants. There is much information concerning the treatment of their royalty, their flocks and herds, their toilet habits, their slaves, and their crops. With all the continued interest, all the exciting adventures and tragedies recounted of this under-world, there is throughout a strict adherence to truth and a spirit of careful research. The two concluding chapters treat of "Insects and Civilization" and "Beneficial and Injurious Insects." The latter deals with the economic aspect of entomology, hut the former is of especial interest in presenting a résumé of the rise and development of the insecta and the part which these multitudinous forms of life have played in human folk-lore. In a word, "Nature's Craftsmen" is close to the idcal type of nature book, well written, well printed, and well illustrated.

The two hundredth anniversary of the hirth of Linnæus will he celebrated not only by the University of Upsala, hut also hy the Academy of Sciences in Stockholm, heginning May 25. The name of Linnæus is closely connected with the Stockholm Academy. Before he was appointed to a professorship in Upsala he lived in Stockholm as a practising physician, and together with five other men founded the Swedish Academy of Sciences, of which organization he was the first president. In connection with this celehration the Academy will issue a number of publications, among these important writings of Linnæus which are out of print, and also a series of discussions of Linnæus's work in different branches of natural science, notably hotany and zoölogy, geology, mineralogy, and medicine. In addition the Academy is having a set of Linnæus medallions struck in gold, to he given as special prizes for noteworthy work in the natural sciences.

"Air Compressors and Blowing Engines," by Chas. H. Innes, lecturer on engineering at Rutherford College, Newcastle-on-Tyne (The Technical Puhlishing Company, Ltd.), is English both in plan and treatment. Some little attention is, however, given to American practice, but this is confined to the description of some detail parts of American compressors. The hook hegins with the application of thermodynamics to the compression of air under various circumstances; and formulas are developed for each of the important cases. The second chapter is concerned with experiments on compressors, an important topic, treated too hriefly in seven pages. The critical comparison of details, a valuahle feature in any hook of this kind, is entirely omitted. The steam end of the compressors and hlowing engines is almost entirely passed over, as are also the quantitative results so important to engineers concerned either with building or using machinery of this class; and there is no attempt to reduce formulas to tahles or curves for quick computation.

The Lowell expedition to the Andes Mountains to observe the apposition of Mars and the eclipse of the sun in July next will be in charge of Prof. D. P. Todd of Amherst. He will be accompanied hy Mrs. Todd, A. G. Illse, mechanician, and E. C. Slipher of the Lowell observatory, an expert photographer. The party will sail May 11.

Drama.

The sixth and seventh volumes, numbered seven and nine, respectively, in the set, have appeared of Scribner's new edition of the collected works of Henrik Ibsen. They contain "An Enemy of the People," in Mrs. Eleanor Marx-Aveling's translation; "The Wild Duck" and "The Lady from the Sea," translated by Mrs. Frances E. Archer, and "Rosmersholm," translated by Charles Archer. Each play has an introduction by the editor, William Archer. Of the translations, that by Mrs. Marx-Aveling, already familiar to English readers, is by far the most successful, both on account of its greater virility and its more faithful rendering of the subtle shadings of Ibsen's language. It is to be regretted that she hesitates to put the fanciful and amusing oaths of Dr. Stockman into adequate English. Thus she lets the full-blooded and impulsive reformer's *Forbandede* degenerate into a mild and inoffensive "confounded." But much more serious are the objections to the other translations, and particularly those of Mrs. Archer, all of which show unmistakable kinship to those undertaken by William Archer himself. There is in them the same stiff and stilted language, the same conventional artificiality, the same failure to make the tone of the original audible. In Mrs. Archer's version, the reckless Relling himself, perhaps the hest drawn figure in that wonderful gallery of character studies, "The Wild Duck," speaks unassailably proper parlor language even in his cups. Under these circumstances it is not at all surprising to find that the translator has wholly misunderstood, and consequently misinterpreted, Dr. Relling's famous final remark hefore the curtain fall in the fifth act. When Gregers Werle sentimentally exclaims that his mission in life thereafter will be to act as the thirteenth guest at the tahle, the cynical manufacturer of serviceahle "life-lies" for broken-down idealists regards this as another one of the man's empty phrases, and shouts after him: "The devil believe it!" Mrs. Archer makes him say mildly and apparently in surprise: "The devil it is." For his introductions Mr. Archer has familiarized himself with the very latest in Ibsen literature, including the valuable material contained in the Ibsen number published by *Die Neue Rundschau* in commemoration of the playwright's death, and the leering, tactless, and not always reliable gossip brougbt out hy John Paulsen in his "Samliv med Ibsen." The matter selected from these sources by Mr. Archer does not shed much new light on the plays. Pages are devoted to fruitless discussion of alleged or actual models used hy Ibsen, or of events which are supposed to have furnished him with suggestions. On the other hand, Mr. Archer comes nearer the truth than George Brandes in his estimate and classification of "Rosmersholm," placing it, as he does, with the psychological rather than with the social plays. In quoting some of Ibsen's own letters, Mr. Archer has found chance once more to display his peculiar misunderstanding of Ibsen's most characteristic expressions. For instance, he goes out of his way to explain why he has translated the Norwegian word *Galskaber* as "whimsies," instead of rendering it literally as "mad notions." That the word, as used time and again by Ibsen, has a complete and very descriptive equivalent in the English "crotchets," does not seem to have been suspected by Mr. Archer.

Full details are given in the London papers of "The Lily of France," Louis N. Parker's play about Joan of Arc, which is to be presented at His Majesty's Theatre in London by Beerbohm Tree. In the order of its incidents it seems to hear a rather strong resemblance to Percy Mackaye's play on the same subject, hut it is chiefly in prose. Mr. Parker is credited with the most scrupulous attention to the facts of history wherever possible. He has divided his work into five acts entitled respectively "The Maid Mystic," "The Maid Marvellous," "The Maid Militant," "The Maid Triumphant," "The Maid Martyred." The first act is at Domrémy. The first scene of the second act is at Vaucouleurs; the second scene at Chinon. The third act is at Orleans. The fourth act is at Rheims, outside the Cathedral. The fifth act is at Rouen. The great spectacle—and Mr. Parker is an expert in pageantry of this sort—is to be provided hy the Cathedral scene. The whole stage opening will be occupied by a reproduction of the doors of the Cathedral—almost in fac-simile—which will be swung open to reveal a vision of the interior, with its blazing lights, ecclesiastical splendors, clouds of incense, and masses of spectators in all the richness of mediæval array. It is not difficult to believe, in view of what has been accomplished already, at His Majesty's Theatre, under Mr. Tree's management, that this will be one of the finest stage pictures ever exhibited.

In the Neues Theater in Leipzig both the first and second parts of "Faust" have just been successfully given in a single evening—a dramatic event heretofore reserved for the famous old Bühne of Goethe and Schiller at Weimar—with a new arrangement of the text by Prof. G. Witkowski. The first part of the tragedy was considerably shortened, various stage traditions were abandoned, and the scene in heaven was unusually elahorate. The new music of the young composer, Feldweg, however, proved less attractive than that of Lassen.

Maude Harrison, who was one of the most popular actresses in the city twenty-five years ago, died here Sunday at the age of fifty-four. She had a natural gift for light comedy, playing mischievous, provoking or coquettish parts with delightful archness. At her best she exhibited a delicacy of method worthy of the French stage. One of her greatest successes was won in the part of the gay young Mrs. Brown in Bronson Howard's "The Banker's Daughter." It was during her engagement with A. M. Palmer, in the most prosperous days of the Union Square Theatre, that she accomplished her best work. After the dissolution of the Union Square organization her appearances in this city were at longer and longer intervals, and she never regained the position to which her abilities entitled her.

Music.

Anthology of French Piano Music. Edited by Isidor Philipp. Boston: Oliver Ditson Co. 2 vols. $1.50 each.

Perhaps the greatest of all musical puzzles is the fact that England, so prominent in all the other arts, has never produced a composer of the first rank. Almost equally mysterious is the failure of France and Italy, two of the world's three leading musical countries, to give birth to a first-class pianoforte composer. Not only Germany, with her Bach, Beethoven, Schubert Schumann, and others, but Hungary with Liszt, Russia with Rubinstein and Tchaikovsky, Poland with Chopin and Paderewski, Norway with Grieg, the United States with MacDowell, have all given to the world greater music for the piano than have France and Italy. Doubtless the preponderating interest in opera in these two Latin countries has had some effect. Yet if Mozart and Weber could write not only good operas, but also splendid pieces for pianoforte, why should not Rossini and Verdi, Auber and Bizet have done the same?

These remarks refer only to pinnacles. But if there is little or nothing in French pianoforte literature that quite reaches the best work of the above-mentioned masters, there is nevertheless a good deal that is excellent, with a charm of its own which grows with familiarity. Indeed, it is quite likely that persons born in France, or brought up on French music, may dispute our remark regarding pinnacles. Possibly Isidor Philipp is one of these. Though born in Hungary, he was reared in Paris and became a naturalized Frenchman. He has long been famed as a pianist as well as a composer, and was therefore well qualified to edit an anthology of pianoforte music for the Musicians' Library of the Oliver Ditson Co.

There is no lack of candidates for honors. The first volume is devoted to the early composers, twenty-three of them, including Lully, Couperin, Rameau, Dandrieu, Gossec; the second to twenty-nine writers of the nineteenth century, including Alkan, Franck, Saint-Saëns, Bizet, Chabrier, Massenet, Widor, Fauré, Godard, D'Indy, Delibes, Pugno, Chaminade, Philipp, Pierné. The editor contributes an introduction and brief biographic sketches to each of the volumes. He thinks that among French composers Saint-Saëns is certainly the one "whose influence has been the most considerable, the most perceptible"; and that Alkan is without question one of the most original among writers for the modern piano, "one whose Études Mineures will some day be included among the works which are indispensable to every pianist." Certainly his prelude in B major, which opens the second volume, is one of the most charming pieces in the "Anthology." That the cacophonous side of modern French music is not represented, few purchasers of these volumes will regret.

The Vienna Male Choral Society (Wiener Männergesangverein) is to give two concerts here on May 7 and 9, which will give local music lovers an opportunity to hear that kind of singing at its very best. The Vienna Male Choir was organized in 1843. Its importance is evidenced by the fact that Schumann, Meyerbeer, Mendelssohn, Liszt, Wagner, Bruckner, Johann Strauss, and other composers have dedicated works to it.

There will be a Bach festival from May 26 to 28 in Eisenach in connection with the opening of the Bach Museum in the Bachhouse. The choir of St. Thomas in Leipzig (Bach's own church) and the court orchestra from Weimar will take part.

Art.

European Enamels. By Henry H. Cunynghame. Pp. xvi., 188; 62 illustrations. New York: G. P. Putnam's Sons. $6.75 net.

The study of enamel has a peculiarly personal interest. The collectors—and by that term is meant all those who study the pieces which they see in the hope, if not in the expectation, of making them their own—the collectors of enamels are full of their subject. Few are these enthusiasts, but their enthusiasm is not diminished by that fact; and even the study of ceramics is languid and perfunctory, compared with the ardor of the student of this form of glass. Something of this warmth appears in this book. It is one of a well-conducted series, the Connoisseur's Library, edited by Cyril Davenport, of which we have reviewed other volumes, as those on Porcelains, on Furniture, and on Ivories.

In the Introduction, the manufacture of enamel is considered at length. The glass itself, its composition and preparation, the application of it to the surface of metal, glass vessels, or ceramic ware, are all explained with care, and still more, with an affectionate attention to details which comes near to satisfying even the critical judgment of the practical workman. This Introduction occupies twenty-four large pages, the last two or three of which are devoted to a perhaps uncalled-for essay on the character of art and of decoration; but it is easy to see how the author came to feel that his remarks were in place. He is an enthusiast for propriety and nobility of design in his favorite art, and he feels strongly the almost insuperable difficulties which attend decorative work in the twentieth century. On page 23 he is considering the chronological sequence of enamels at South Kensington, and the too obvious fact that from the fifteenth century on, while workmanship improves, the art declines, with the worst objects of all in the latest compartment. He is thus prompted to a few words of meditation upon the causes of such discouraging conditions.

The 150 pages which form the body of the work are historical in a true sense, giving not dates and facts merely, but the essential characteristics of decorative enamelling. Chapter ii. deals with that most elusive subject, the enamels of antiquity; and chapter iii., with the more easily grasped Gaulish enamels of pre-Roman and post-Roman times, a paper too brief but very suggestive. Chapter iv. treats the Byzantine enamels; chapter v., "Mediæval Enamels." The 50 pages of these two chapters are probably the most important division of the work. There is much, but not too much, allusion to the social conditions of the periods, and their effect on the artistic productions of the workmen. The consideration of the way in which these brilliant and unfading color-compositions must have appealed to a twelfth-century Christian, of the importance of small but brilliantly effective pieces of religious art, is well presented. The illustrations, too, in these chapters are closely allied to the text, and the text leans upon them for the completion of its thought.

From page 89 to the end of the book the later enamels are treated with more minute description of exact processes, as indeed is natural. The topics are the transparent enamel applied upon bas-relief (*émail en basse taille*), the painted enamels of Limoges, the miniature paintings on enamel, which we associate with Petitot, the enamelled snuff-boxes and watches of the eighteenth century, the British "Battersea" enamels, and the enamelled jewelry of still more modern times.

We close the volume with the feeling that enthusiasm for the art and knowledge of its character are to be gained by a faithful study of these pages. The not very attractive photographic plates are at least useful. It is altogether a good book for the beginner.

Doubleday, Page & Co. will begin their series of Primers of Art with Prof. Edwin A. Barbor's monograph on "Pottery," which includes the Majolica of Italy, Spain, and Mexico, the Delft wares of Holland and England, and the Stanniferous Faience of France, Germany, and other countries. Professor Barbor is curator of the Pennsylvania Museum School of Industrial Art.

In our issue of February 28 we stated that the existence of the New Umbrian periodical *Perusia Augusta* was imperilled, after only one year of life, by the removal of its editor to Rome. We are glad to inform our readers that our fears have not been realized, and that arrangements have been made for continuing publication. Numbers I. and II. (January and February, 1907) have just appeared; and the fact that the committee of the Mostra d'Arte Antica in Perugia has chosen *Perusia Augusta* as its official organ, gives a peculiar interest to the forthcoming numbers.

At Perugia, on Monday, King Victor Emmanuel inaugurated in the Municipal Palace, a large and beautiful edifice built in 1271, a complete exposition of antique Umbrian art, arranged chronologically and comprising a thousand pictures and thousands of other objects, including sculpture, miniatures, jewelry, arms, porcelains, etc.

Charles Scribner's Sons bring out a second edition of Miss Florence Simmonds's translation of Salomon Reinach's "Apollo," which is an improvement upon the first. It is announced as "revised by the author," but it is difficult to know, without prolonged study of the two editions, in just what this revision consists. The original title is restored, and the additions, concerning British art, are now enclosed in square brackets, so that one may know when one is reading M. Reinach and when one is reading Miss Simmonds. This is a distinct gain. One significant omission, of which, as we remember, M. Reinach complained, has not been repaired. On pages 315 and 316 of the original French edition

M. Reinach speaks of "B. Leader, author of the picture, In the Evening There Shall Be Light, which will one day, perhaps, be reputed the *chef d'œuvre* of modern landscape." This passage the translator boldly excised, and it has not been restored; the name of Mr. Leader nowhere occurs in the index of the present volume. We do not know the picture in question, and it is quite possible that M. Reinach's enthusiasm for it is mistaken, but since he alone is responsible for his opinion this suppression of it seems a trifle high-handed.

The Corporation of London is holding its fifteenth exhibition in the galleries of the Guildhall; and in popularity no other exhibition in London is such a successful rival of the Academy. These shows in the past have been, as a rule, interesting artistically and important historically—of real use to artist and student alike. If this year interest and importance are less obvious, it is because, after all, there are limits to the art even of the world. The particular subject is Danish art. The collection includes names seldom, if ever, heard out of Denmark, but the only notable work comes from men like Kroyer and Hammershoi, who are often represented not only in the big modern exhibitions of the Continent, but in London at the shows of the International Society. Kroyer is an extremely accomplished painter. His big group, The Committee of French Artists for the Exhibition in Copenhagen in 1888, is a vigorous piece of work, full of observation and suggestion of character; there are not many artists to-day who can paint a group of the kind without falling into the woodenness of, for instance, Tuxen in The Anointing of Queen Alexandra at The Coronation of King Edward VII. on the opposite wall. Again, Summer Evening at the Skaw is a good study of light and atmosphere, well observed and true. But Kroyer, in these and all his pictures, is the fine craftsman rather than the great master. It is the same with Hammershoi, whose renderings of quiet, simple interiors are delightful in tone and effects of light, who can see beauty in absolutely bare rooms with nothing to break the monotony save a series of open doors, but who never reaches the exquisiteness of Dutch masters like Ver Meer and Terburg. Beyond the pictures of these two men, there is little to give distinction to a commonplace show. The examples of the earlier Danish artists are respectably dull; the artists of to-day, with the two exceptions, have apparently done nothing to interrupt the tradition of dulness. Judging from the collection at the Guildhall, the daring, the boldness, the vigorous expression of individuality frequently conspicuous in collections of Scandinavian work, are the characteristics of the artists of Sweden and Norway rather than of the artists of Denmark. Had a place been found in the collection for the illustration of the country, it probably would have gained in both distinction and interest.

The fortieth annual exhibition of the American Water Color Society is now open at No. 215 West Fifty-seventh Street. There is an exhibition of members' work in painting and sculpture at the National Arts Club, No. 119 East Nineteenth Street. Examples of early American art will be shown at Ehrich's till May 10. There are some modern Dutch water-colors at William Schaus's; and Robert Grier Cooke has on private view for a short time a collection of original catalogue proofs of a famous collection of Chinese porcelains. The plates in color are noteworthy as fine examples of lithographic facsimiles.

Thomas S. Noble, a painter and for thirty-five years head of the Cincinnati Art School, died on Saturday in this city. He was born in Lexington, Ky., seventy-four years ago, and studied in Munich and Paris. Soon after his return to the United States he was selected to head the Cincinnati Art School, a position from which he retired five years ago.

Howard Helmick, an artist of some repute and professor of art at Georgetown University, died in Washington on Sunday. He was born in Ohio in 1845, and when about twenty years old went abroad to study. He became known through his scenes of Irish peasant life. His works have been exhibited at the Paris Salon and at the Royal Academy of London. At the time of his death he was employed as an illustrator for the *Century Magazine*.

At the recent sale in Paris of pictures collected by the late Georges Charpentier, Renoir's group, La Famille Charpentier, exhibited at the Salon of 1879, brought 84,000 francs, the highest price yet paid at auction for an example of this artist. Other prices were: Renoir, Le Pêcheur à la Ligne, 14,050 francs; Charles Jacque, Moutons à la Lisière d'un Forêt, 34,000 francs.

Finance.

THE MONEY MARKET IN EUROPE.

Six or eight weeks ago, three predictions were made in European financial circles: the first, that the Bank of France, having already raised its official discount rate from 3 to 3½ per cent., would advance it again; the second, that the Imperial German Bank would not be able to reduce its rate from 6; the third, that, if New York were to import gold from London, the Bank of England would restore its rate to the 6 per cent. figure, from which it was reduced on January 17. All these predictions have turned out erroneous. The Bank of France has not raised its rate again; last week the German bank rate went down to 5½; and although New York actually did take gold in the interim from London, the Bank of England has twice reduced its rate, which now stands at 4. Such a sequel has started general inquiry as to whether markets were not wholly mistaken as to the financial situation generally.

Outside of the markets, these European "official bank rates" are regarded as much of a mystery. Even financiers who understand the purpose of a rise in the rate—to attract from abroad capital needed at home, or to prevent movement of capital from the home market—are likely to view the changes as purely arbitrary. In a sense, they are; the vote of a single board of directors fixes a new "official rate." But to its maintenance, there is a limit in the ordinary developments of banking. If, as lately happened at Berlin, all other lending institutions are putting out money at 4½ per cent., while the State bank stands for 6, the probable result is that the State institution will lose the great part of its business. Now these institutions, though enjoying peculiar privileges from the Government, are nevertheless joint-stock enterprises, paying dividends to their proprietors. They naturally do not wish to go out of business, even for a time; and, furthermore, unless there is thought to be urgent need (as in London last October), the business community, all of whose borrowings are made more costly through the maintenance of such rates by the largest lender, protests against the action. Hence there is strong inducement for a lowering of high official discount rates, as soon as the general market seems disposed to lend more cheaply.

But why, if the apprehensions of six weeks ago had a reasonable basis, should the money rate have fallen, even on the open market? Two answers may be made. Stock speculation, at London, Berlin, and New York, has been checked; speculators have closed out their bank loans; demands

on the world's money market have therefore greatly decreased. But aside from this, New York, to whose expected "demand for gold" all Europe was lately looking anxiously, has ceased to draw on Europe. For this outcome, the reduced needs of our banks, through the Stock Exchange liquidation, partly account; the Treasury's release, through deposit with the banks, of $30,000,000 surplus revenue, perhaps accounts for more. At all events, it is certain that the fall in money rates at New York itself has been more rapid, during this period, than at any European market. This decline in Wall Street money rates was equivalent to New York's ceasing to bid for European capital and European gold; exchange on London, which in March sold at a rate admitting of exceptional profit from import of English gold, has now risen to a level as near the gold export as to the gold import point. There was, therefore, little reason for maintaining the high protective bank rates at London and Berlin.

It is a natural query, under such circumstances, whether the strain on capital is now definitely past. It would be rash to say so; much depends on what the American speculative markets do, between now and the always critical period of autumn. Late spring and early summer are traditionally seasons when trade demands on a market's supply of capital are light, for the reason that trade itself is relatively inactive. This is, however, no assurance of what conditions may be a few months later. Last July, two-months loans in Wall Street went at 3½ per cent., or much lower than the rate which prevails to-day; yet the extreme stringency of the autumn came in spite of midsummer semblance of easy money. As lately as last September, the Bank of England's official rate was 3½ per cent., or less than the present rate; yet it went to 6 per cent. hardly a month afterward.

The Nation.

NEW YORK, THURSDAY, MAY 9, 1907.

The Week.

It is a dull day which does not see at least one Roosevelt third-term story. Henry Watterson tells a specific renunciation uttered by the President last winter in presence of "a company of journalists." "Upon my honor," it ran, "if the next Republican convention nominates me and adjourns, it will have to reassemble, because I will not accept the nomination." The other contribution is Paul Morton's declaration that, "if he would run again, there is not the slightest doubt the Republican National Convention would make his nomination by acclamation." Both men assume that the decision lies solely with Mr. Roosevelt himself. If he says the word, or authorizes any one to say the word, the nomination is his. But the efforts to induce him to take this action do not appear to make headway. There is, for instance, the theory that, because Roosevelt was elected in his own right for the first time three years ago, this is only his first term, and he ought to have a second, as a matter of course. Not only did the President himself brush this reasoning aside, but the press and public have absolutely refused to accept it. A League in Chicago has been incorporated with "third-term" in its title. Both advocates and opponents speak of the additional four years by that name. But, amid manifold counsels, we have looked in vain for any suggestion that Mr. Roosevelt's tenure of office can be shortened by anything but his own volition. Renominated Republican Presidents have been defeated by Democrats, but nobody thinks of that possibility any longer.

Details of the tariff agreement with Germany, made public last Saturday, show that our exporters are to get the minimum rates of the German tariff, while German exporters are to be benefited by a relaxation of our severe administrative regulations. Our Government undertakes to modify or abolish some of those rules which have gone upon the supposition that importing is a crime, and that all importers are perjurers. We can but hail the improvement, though we must note that the abandonment of the old policy is really to pull down one of the pillars of the protective system. Furthermore, by the agreement, President Roosevelt undertakes to "recommend" to Congress an amendment of the Dingley act in the matter of undervaluations. But will not this be doing that horrible thing—to "open" the tariff question? How could the nerves of the country endure that shock? We forbear to suggest what would happen if the President should also go on to recommend amendments of the Dingley law of a sort to draw the fangs of the oppressive monopolies which take shelter behind it. That would be too terrible even to contemplate from a distance.

Beyond all question, one of the most effective arguments for restriction of immigration is the recent activity of Italian and other alien criminals in this country. A few weeks ago two New York policemen were killed in the pursuit of an Italian assassin. "Look at the list of outrages," say the restrictionists. "Are we to allow men of this kind to continue entering our country by hundreds of thousands every year?" A drastic restrictive measure, with an educational test as its chief feature, failed of enactment in the last Congress by the narrowest of margins; while a compromise bill, carrying an increased head-tax, became law. That efforts will be resumed in the next Congress to put through all the eliminated provisions is certain. It is therefore most significant that the friends of reasonable immigration are preparing to abandon a purely negative programme and offer constructive legislation of their own. The Liberal Immigration League, the influential organization which led in the opposition to the narrow bills of the last two years, has already suggested a method of dealing with the pressing problem of the alien criminal which deserves consideration. The idea is, in effect, to extend to criminals the principle of deportation already applied to the dependent classes. Under the present law, if an immigrant for any reason becomes a public charge before becoming a citizen, he may be sent back to the country from which he came. The Immigration Bureau has developed a system of coöperation with the poor authorities of various localities and kept its records in such a way that the operation of this law is now comparatively certain. Under this provision several hundred deportations are made from this city alone every year. If a foreigner commits a crime, however, we not only put ourselves to the expense of his punishment, but, after he has served his term, let him continue to live in this country. It is cited as an illustration of present conditions that 132 Italian "confidence men" are now in Sing Sing. If the same men, within a certain period after their arrival, had merely applied for public aid, Italy could have been compelled to take them back.

The decision which Justice Gould of the Supreme Court of the District of Columbia has rendered in the case testing the right of the Government to pay for the education of Indians at sectarian schools, naturally concerns only the legal, and not the political, side of the question. The decision that the Government *can* pay money to the Roman Catholic and Lutheran schools does not at all mean that it *should*. At the same time, Justice Gould's decision establishes the principle that out of the three sources of Indian funds, two are definitely unavailable for the sectarian schools. When Congress declared in the acts of 1896 and 1897: "It is hereby declared to be the settled policy of the Government to hereafter make no appropriation whatever for education in any sectarian schools," this inhibition, according to the decision, applied not only to the money paid from the general treasury, as army or river and harbor money is paid, but also to the sums paid in fulfilment of treaty obligations, known as "treaty funds." It did not apply, however, to the "trust funds," interest paid by the United States Government on sums specifically set aside for consideration given long ago by the Indians. These can still be laid out at the discretion of the Secretary of the Interior. While the withdrawal of the treaty fund money will reduce the incomes of the denominational schools, the total available for Indian education will be as large as ever. If the various denominational authorities decide to support their own institutions adequately in future, it should be even larger.

The latest accident bulletin of the Interstate Commerce Commission, covering the three months ending December 31 last, shows that the total number of railroad casualties during that period was 20,944, an increase of 1,094 over those reported during the preceding three months. The number of passengers and employees killed was 494, an increase of 207 over the previous three months' figures; the passengers killed being 180. These figures prove conclusively that the discussion of railway conditions ought not to stop for one moment until public sentiment can be brought to bear to correct existing conditions. Hence we can but welcome, in the current *Atlantic*, Frank Haigh Dixon's article on "Railroad Accidents." Mr. Dixon goes with great detail into the various causes—overwork, negligence, inexperience, etc. His conclusion is that the "fundamental weakness of American railroading, from the standpoint of safety, is the widespread and almost universal lack of discipline." This, he feels, extends all the way from

the speculative Wall Street type of director to the humblest employee. He does not dwell upon the part played by the labor unions in bringing about this weakness; yet this phase of the question is in pressing need of immediate and unbiassed investigation.

In rejecting the bill for taxing residential property belonging to colleges and universities, the Massachusetts House of Representatives has shown itself true to the best traditions of the State. The Senate had passed this measure by a small majority, although there was no reason for supposing that the growth of exempted property was imposing a burden which was not more than outweighed by the advantages flowing from the presence of an institution of learning. Only last summer the whole question was studied by a special committee of the Legislature, which came to the conclusion that "the financial conditions of all the college towns are as satisfactory as those found in the great majority of our communities." The action of the Senate, therefore, came as an unpleasant surprise to the friends of education. But in the House, the proposal was defeated by a vote of 142 to 14, after a debate which made it clear that the historic policy of the commonwealth is not likely to be changed at the behest of a few demagogues and malcontents. It was sufficiently discreditable that the proposal could even be seriously considered.

Dr. John Watson, who died on Monday at Mount Pleasant, Ia., was a lecturer of distinction and the author of several books of education, but he will be remembered longest as the "Ian McLaren" who was largely responsible for the vogue of the prettily humorous and pathetic kailyard fiction. If we remember correctly, it was Dr. Watson's "Bonnie Brier Bush" which rivalled S. R. Crockett's "Lilac Sunbonnet" for first place in a schedule of genius created not long since by the professor of English in a large State university. His system was beautifully simple. Out of 100 per cent. set apart, say, 20 per cent. for the height of pathos, 15 per cent. for humor, and so on through the list of sublimity, picturesqueness, etc. The result of such a test brought the kailyard fiction high above Shakespeare, for it was demonstrable that ten tears were shed over the "Bonnie Brier Bush" for one over "Hamlet." The system had its value as a striking example of what may be called the fallacy of the present; and it showed how small a part is played in great literature by the more facile emotions. The kailyard has already grown a little stale to us, but we can afford to remember Dr. Watson's stories with kindly affection.

Next we are to have an S. P. C. Q.—or Society for the Prevention of Cruelty to Quotations. The *Academy* urges its founding, and points out some of the cogent reasons for it. If the maiming and flogging and overworking of horses have become an offence in civilized eyes, why are not the same things cruel when done to a poetical citation? Surely, a merciful man will be merciful to quotations. When he hears some one dropping easily into "fresh *fields* and pastures new," his sensations cannot be very different from those of a sensitive man seeing a horse's tail docked. The inaccurate quoter is much more abroad than the schoolmaster, and a great number of excellent quotations are abominably ill treated at every public dinner. As for overloaded dray-horses, they are not to be named beside certain quotations. When a political orator begins: "You can fool some of the people——" the universal groan which arises from the audience betokens the same sort of sympathy that is called out by the sight of a man trying to flog a worn-out animal along the road. Of course, it is difficult actually to prevent such cruelties to quotations; but it should be possible, as the *Academy* says, to inflict "severe penalties on malefactors who misquote or distort to base uses the words of wiser men."

If a legislative measure is to be reckoned blessed when men speak evil of it, the bill which Mr. Birrell introduced into the Commons Tuesday, carrying an instalment of Home Rule for Ireland, must be accounted fortunate. It is already variously reviled as preposterously moderate and outrageously revolutionary, unspeakably timid and recklessly daring. But they cannot have it both ways. The truth lies between. To establish an Irish Council, as the Liberal Government propose, with varied administrative but no legislative powers, is not to grant Home Rule. It is, however, to give the Irish a much larger control of their own affairs; and if they prove faithful over that which is little, they may hope to be made rulers over much. And the great point is that this bill is brought in by convinced Home Rulers. Both the Prime Minister and the Chief Secretary have openly declared themselves to be such. If they could, they would give Ireland absolute Home Rule outright. But they know they cannot; and hence their tentative measure is to be judged in the light of what is now wise, because practicable. The Ministry could undoubtedly put through the Commons a bill as drastic as either of Mr. Gladstone's; but it would be contemptuously thrown out by the Lords. Thus the true friends of Ireland may well pause to consider whether a substantial step in advance is not better than a passionate rush that would only result in being thrown further back than ever.

The situation that now confronts Great Britain in India calls for skilful handling. The disorders in the Punjab have an element of seriousness which is lacking in the anti-British agitation in Bengal, since the inhabitants of the Punjab have by no means the unwarlike reputation of the Bengalese. The province is the home of the Sikh, and is not unacquainted with Kipling's Pathan. In Bengal, demonstrations have been confined to speechmaking and boycotting. In Lahore, there has been ominous rioting. Now, the Punjab is not far from the northwest frontier, that tenderly sensitive nerve in the line of the British defence. What will be the effect of sedition on the restless tribes of the frontier? What on Habibullah Khan of Afghanistan, who has just returned from a visit to his good friend, Lord Minto? What will be the effect further still across the Pamir in Russia's Transcaspian territories? The London *Times* calls the events at Lahore an "unpleasant reminder of certain disquieting features in the condition of India," and calls for strong measures. "We are bound to enforce respect for British authority and to give protection to the law-abiding majority, which is still prepared to uphold that authority, but which we are apt to disregard, because it is too loyal to be clamorous." A much more moderate view is that of the Calcutta *Englishman*, which speaks in a deprecating tone of the immense expense connected with "the reforms now loudly advocated."

Both papers admit the necessity of reform, even as Secretary Morley has admitted and promised it. On the chief cause of discontent, the insufficient participation of the natives in the government of the country, the *Englishman* will not admit that the Hindus are lacking in high capacity for self-government. "We all know," it says, "that there is a great fund of dormant political wisdom in India, and it only remains to devise some expedient by which it can be tapped." It will hear nothing of suppression, and counsels that in each province a conference between leading reformers and chosen representatives of the administration be called for the discussion of existing difficulties "in a practical and friendly spirit." This would be living up to the best traditions of British colonial government. The difficulties that would have to be discussed are undoubtedly many. One is the heavy cost of British rule. In the Viceroy's Council the representatives of advanced native opinion have been demanding a reduction in army expenditure, in view of the admitted immunity of the peninsula now from

the danger of invasion. Under the caption of "The Sword in India," the *Englishman* writes: "Roughly speaking, the Government spends 35 out of every 100 rupees of its revenue on military and defensive operations. This is undoubtedly a very large sum to pay for insurance against disaster." A large sum, indeed, considering that military-ridden Russia and Germany spend only 15 per cent. of their revenue for the same purposes.

The refusal of Germany even to discuss the limitation of armaments at The Hague is bound to create widespread distrust. Granted Prince von Bülow's contention in the Reichstag last week, that Germany has never misused her military forces, the reason why she should join now in a movement to limit them would seem all the more cogent. The really peace-loving nation looks forward to the time when it can lay aside its arms as the frontiersman does to the hour when he can give up carrying his revolver. What possible harm can Germany suffer from participating in the Hague discussion? The Chancellor announced that if any practical result is achieved in the debate on limitation, "Germany will conscientiously examine whether it harmonizes with the protection of her peace, with her national interests, and her peculiar situation." But if the outcome of the debate is worth considering, why not take part in it, and strive to direct it into a practical channel? The surprising thing about the Reichstag discussion is the apparent unanimity of all parties in support of the Chancellor. Reduced in representation as the Social-Democrats are, they still speak for one in every three German voters, and their party has always stood out against the crushing military burdens which the laboring men have to carry. They should have been prompt to protest against the Chancellor's attitude. As Mr. Carnegie said at the Peace Congress, the Kaiser has to-day the greatest opportunity of any mortal man to bring near the day of universal peace. Thus far that opportunity seems not to appeal to him.

The conclusion of an agreement between France and Japan providing for the maintenance of the *status quo* in the Far East is announced as imminent. Such an arrangement was bound to come, after Russia's overwhelming defeat. The attitude of the French Government during the war was not such as to arouse peculiar gratification at Tokio, and politicians could scarcely be called timid if they regarded with apprehension the possibility of a day of reckoning in Indo-China. That peninsula represents, as yet, the only instance of appreciable success in colonial administration that France can show. Its loss would undoubtedly mean the end of the republic as a colonial and, possibly, as a world-power. Undoubtedly, the common understanding with Great Britain will facilitate the settlement of all points of difference between the two contracting Powers, and the satisfactory progress of Russo-Japanese negotiations must also help. That Russia is planning a war of revenge is not improbable, but it is evident that the influence of France with its European ally will now be exercised to prevent or delay such a war, which itself would be costly in the extreme. In so far as regards China, all fear of foreign attack should now be completely at rest, and real progress towards internal reform should begin.

The authoritative announcement of the Russian Government's decision to proceed immediately with the double-tracking of the Siberian Railroad will be taken, of course, as one more illustration of the rather hackneyed truth that Russia never retreats but to come on again. Putnam Weale, who of late has become for us undoubtedly *the* light of eastern Asia, emphasizes the truth in a series of studies in the *North-China Herald*, dealing with "The Present Position in Far Eastern Affairs." In his concluding article he points out what great progress Russia has been making, since her expulsion from Manchuria, in the devolpment of her neighboring Amur Province. The shattering of the foolish and alien policy of naval adventure has enabled her to concentrate her strength on land, which Mr. Weale regards as her only proper field. Vladivostok, in the southern corner of the Amur Province, has enjoyed unexampled prosperity since the war. Still more marvellous has been the growth of Nikolaievsk, in the extreme northern corner of the province, at the mouth of the Amur:

> Five years ago it may have had at the full season only two or three thousand inhabitants; to-day, including the military, there are supposed to be more than twenty thousand Russians in the town.

A "forgotten" Amur railway scheme has been revived, and surveys are already under way from Blagovyestchensk and Khabarovsk, at the junction of the Amur and the Ussuri. The difficulties connected with the project are enormous—

> But against those things must be set the hardihood and certain grim tenacity of the Russian race. As a nation they are a race of men who are the Sons-o'-men—of that there is no doubt. If they will only be guided in a certain direction and become intensive instead of merely extensive, the hardihood of the race and the unparalleled natural riches of their territory will finally work out an extraordinary solution. Whether this solution will end in another anabasis—straight down to the South from Khabarovsk—it is too soon to say. Yet it is plain that there are great and unexpected things in the making.

The formation of a new Belgian Cabinet, last week, terminated the crisis precipitated by the resignation of the Smet de Naeyer Ministry on April 12. The new Premier is M. de Trooz, Minister of the Interior in the preceding Cabinet, of which one other member, M. Liebaert, remains in power as Minister of Finance. The Catholics retain control of the Government because they can rally, officially, an absolute majority in the Chamber, 89, acording to the results of last year's elections, as against 47 Liberals and 28 Socialists. The defeat of the Smet de Naeyer Cabinet was brought about by the defection of the Young Catholic element, numbering some twenty members, who have for some time opposed the conservative tendencies of the Government, from an advanced democratic standpoint. Like the German Centre, they would have the Church take the lead in social legislation, and they have shown themselves ready on occasion to join hands even with the Socialists in bringing the necessity of such a policy home to the Ministry. But a permanent alliance with the Opposition was, of course, out of the question; and there remained only the possibility of reconstituting the Catholic Cabinet on more liberal lines. That such must be the nature of the new Government follows from the ever-present danger of a second Young Catholic secession.

Although the Conservatives carried the elections in Spain, the Republicans showed themselves more numerous and active than for years. Their most notable accession was that of the most famous of living Spanish writers, Perez Galdós. He had always been a monarchist, and was once a member of the Cortes, sitting for a district in Porto Rico. But in the last election he offered himself as a Republican candidate in Madrid itself. Explaining his change of view, he said:

> My monarchist faith was long since undermined, but what has completed the transformation of my political ideas was the melancholy spectacle of the defeat of the law for the separation of Church and State. This showed that we were under a régime which had added to our numerous ruling oligarchies an intolerable ecclesiastical bossism.

Of course, Galdós was not elected, but his open revolt was an ominous sign of the times. He is "one of the glories of Spain," as his countrymen love to call him, and his blossoming out as a Republican made a sensation as great as would an announcement by Mr. Howells that he was pining for an American Emperor.

THE UNHOLY ALLIANCE AT ALBANY.

One needs merely to scan the voting list by which Kelsey was kept in the office of Superintendent of Insurance, to perceive what an abhorrent combination it was which defeated the Governor. Doubtless, some honest Senators voted to retain Kelsey in office. They did so either for reasons of personal friendship, or because they were not convinced that his incompetence was sufficiently glaring to warrant his removal. But there was a tell-tale rallying of the worst men on both sides to thwart Gov. Hughes's honorable effort to make the public service efficient and pure. When Raines strikes hands with Grady, when Allds embraces McCarren, when the solid phalanx of Black Horse Cavalry Republicans are found riding cheek by jowl with the Tammany Senators, honest men know that they have before them a union of rogues. It was the triumph of "Raines Democrats" and "Grady Republicans."

There can be no mistaking the sinister nature of this unholy alliance. In its formation, the Kelsey case was but a temporary and minor incident. To much larger issues and richer plunder does this banding of corruptionists look forward. If an entire reform programme can be brought to earth, there will be fine pickings for the agents of the disaster to the State. Raines and Grady would, of course, find a deep bond of sympathy in any plan to prevent the offices from being taken out of politics; but once they had made a secret working agreement on this basis, they would see the great possibilities of extending it for their mutual benefit. And the State? The good of the public service? The wishes of the people? Even the welfare of the party? Really, you must not trifle with the men who engineered the plot to defeat Gov. Hughes by supposing that any such considerations ever enter their heads.

Throughout all these thickening machinations, Gov. Hughes has borne himself with a fine dignity and consistency. He has known perfectly well that he could have had his way in the Kelsey affair had he been willing to pay the price. But he has scorned to do so. An Odell in his place would have worked his will by a mixture of terrorism and bribery. He would have threatened some opposing Senators; vetoed their bills, dismissed their appointees, started back-fires in their districts; others he would have bought with offices and jobs. But Mr. Hughes started out by declaring that he would stoop to none of these low arts of the politician; that he would attempt neither to bully nor to wheedle the Legislature; that he, as Governor, would do his duty, and would expect Assembly and Senate to do theirs. Down to the very end of the fight over Kelsey, Gov. Hughes was importuned to use the political powers of his office; to "see" two or three Senators, and change the entire aspect of the contest. But he steadily refused. He might be defeated, but he would not be disgraced by eating his own words and "playing politics." "I am no politician," he said simply; "I am Governor. Those gentlemen upstairs are the Senators." The people of New York believed that they had elected a just and tenacious man Governor. Now they know it.

One audacious Senator, anxious to add lying to turpitude, affirmed in the debate last week that the reason Gov. Hughes desired to have Kelsey removed was that he "wanted the place." This would not deceive a child. The Governor has placed himself visibly above such calumny. No man has ever gone to Albany with an eye more single to the well-being of the commonwealth. He wanted the place of Superintendent of Insurance, only in the sense that he wanted it filled by a man who would be watchful over the vast interests committed to his charge, and resolute in enforcing the law. That Otto Kelsey measures up to these requirements, no sensible and open-minded man will contend. The demonstration of his ignorance and flabby indecision was complete. He has been retained in office, for the time, not because he was fit, not even because the scheming politicians cared a straw about him personally, but because he furnished a convenient excuse for Herod and Pilate to make peace in a common cause, and on skilfully chosen ground, against the Governor.

The party significance of last week's vote in the Senate is obviously great. Ten Republicans joined with seventeen Democrats to oppose and defeat the Republican Governor. The tail of the Senate wagged the dog. This shows a reckless disregard of even partisan motives which has set many to wondering. What are Raines and Allds about? Do they want the Democrats to win, not only in the Senate, but in the next State election? The answer of the Albany correspondents is that these men snap their fingers at the prospect that their course will lead straight to the defeat of their party. So long as a man like Hughes is at the head of it, they would prefer to see it defeated. Secure in their own districts, as they think themselves, they would be pleased to see a reform Governor succeeded by a man, of whatever party, with whom they could resume their political buying and selling. But we believe that their gloating over their initial success is premature. Gov. Hughes has far from exhausted his power to rouse public opinion. The people of this State have been so long unaccustomed to an honest and fearless Governor, throwing himself upon them in disregard of the bosses and the politicians, that they may seem a little slow in responding; but we are confident that Mr. Hughes has but to make his appeals still more direct and pointed, in order to rouse a sentiment in this State before which even the brazen Raines and the unspeakable Grady will cower. It is an advantage, sometimes, to know the worst. The conspiracy against the Governor is now fully uncovered. He needs only to rouse himself and state his case to the people, without mincing language or refraining from mentioning names, and then, either this year or next, his enemies, who are the enemies of decent government, will be covered with confusion, as they now are with ignominy.

A CITY THAT STAYED AWAKE.

J. Horace McFarland, the president of the American Civic Association, has just republished his pamphlet entitled, "The Awakening of Harrisburg," revised to include the progress of the work to the end of 1906. It tells a story of five years of civic endeavor and triumph which cannot but bring encouragement to any American who harbors doubts whether our cities will find their way to good government. Harrisburg began to awake to its opportunities in 1902, and elected an admirable reform mayor in February of that year. There has since been no reaction, but a steady progress upward. A second reform mayor is now in office, and the effort to beautify the city, keep it morally and physically clean, and make it afford excellent service to its inhabitants has been maintained, until now it is almost a model for other cities.

This Harrisburg achievement is the more remarkable because, as the capital of the State, it harbors the Legislature, whose influence can hardly be uplifting, particularly in view of the shocking revelations as to the "graft" in the construction of the new State house. There was little in 1901 to distinguish it from a host of other small American cities. Its rarely beautiful river bank was a mere public dump; its drinking water was typhoid-laden; its sewerage imperfect; its streets dirty and unpaved; its police ready to protect or encourage vice. It was deficient in parks, playgrounds, and the other things that go to make life in a city attractive. In May of that year a fund of $5,000 was raised in ten days to employ three engineers to report upon the municipal problems. They submitted elaborate reports, but it was found that, if the voters consented, Harrisburg's debt could be increased by $1,090,000, and that all the recommendations of the engineers, with but slight modification, would then be within the city's resources. Another $5,000 was promptly subscribed for educational work—the $10,000 thus given by private citizens being equivalent to a fund of $800,000 in New York city. The Municipal League of Harrisburg was set in

motion, and, after an extraordinarily painstaking and thoroughgoing campaign, Vance C. McCormick, a young alumnus of Yale, was elected mayor, and the million-dollar loan approved by a majority of 3,590, out of a total vote of 11,039.

"The Administration of Mayor McCormick," says Mr. McFarland, "was a revelation. The city was cleaned up morally and physically as fast as this young man could bring it about." No man was appointed to office who was not competent, and the "pull" for once absolutely disappeared. The police force was completely reorganized; and within three years Harrisburg, with less than 75,000 inhabitants, became one of the cleanest cities in the country, its twenty-two miles of paved streets being swept daily at a cost of $1,500 per mile a year. For the extension of the asphalt pavements a real competition was obtained, with unusually low bids. An inspection bureau, organized by the mayor and backed up by the Municipal League, saw to it that only first-class pavements were laid. When Mayor McCormick's term expired, he was ineligible for re-election under the Constitution of Pennsylvania. The "machine" thought that, of course, it could now count on a return to power. Instead, another able business man, Edward J. Gross, was chosen mayor, and the work of betterment went on without a break.

The sewerage and drinking-water problems were placed in charge of a Board of Public Works, consisting of three public-spirited citizens. Built out of the proceeds of the loan, raised in February, 1902, the completed filtration plant was in operation by October, 1905, supplying "from nine to twelve million gallons a day of pure, clear, sparkling water, in place of the muddy, intermixed, and typhoid-polluted fluid previously served to our defenceless citizens." A great intercepting sewer and a number of main sewers have been built, and under a new loan, voted in 1905, further extensions of the system are being constructed. Meanwhile, the river front has been made into "one splendid strip of green more than a mile long," giving superb views of the river and mountains, and making an ideal breathing place for the people. More than two miles of this river front are being acquired for a similar metamorphosis. In all, nearly four miles will be converted into a continuous park, untouched by commerce or residence; and this is to be but a part of the parkway eighteen miles long, which is to encircle the whole city. And all the land for this parkway has been given without cost by public-spirited citizens. Meanwhile, Reservoir Park has been trebled in size, a playground of ten acres opened in a district adjoining what was the worst slum section, an island park of twenty acres has been created, and a great Wildwood Park of six hundred and fifty acres is under way, which is to have a reservoir lake as part of a flood-protection scheme.

All this and much more has been done at a slight increase in taxation—barely one-fourth that proposed when the "Harrisburg plan" was adopted. In brief, the city has demonstrated beyond a doubt that good government pays; that there is any amount of native administrative ability available in our American cities, if only party worship can be done away with. Best of all, every sign indicates that awakened Harrisburg will stay awake. There is not only no feeling of regret, but, as Mr. McFarland reports, the "citizens are looking forward to greater achievements."

OUR FOREST BALANCE SHEET.

Following upon the passage of a law which entrusts Congress, and not the President, with the duty of creating additional forest reserves, the Department of Agriculture has issued a circular by Forest Inspector R. S. Kellogg summarizing the present status of "The Timber Supply of the United States." Many years of agitation have brought a general disposition on the part of both national and State authorities to deal with our forests in accordance with a consistent and far-sighted policy.

Proper data have been difficult to secure. The estimates of this country's forest assets have had to be raised by the experts not once, but many times. In the case of several important species of trees, we have already cut and marketed a great deal more than the total was estimated to be in the census of 1880. New varieties of lumber have come into commercial use, as was illustrated by the passing of first place among lumbering States this year from Wisconsin, with its white pine, to Washington, with its Douglas fir. We have not been sure in the past just how imminent a timber failure might be, and we cannot be sure now.

Nevertheless, the one truth more accurately established than any other reveals a surprising condition. In spite of the mounting price of wood and the many industrial uses in which it has been supplanted by other materials, this country is using not only absolutely, but relatively, more wood than before. Between 1880 and 1900 this country's population increased by 52 per cent.; its lumber-cut increased by 94 per cent. Where Europe uses annually 60 feet of lumber per capita, we use about 400.

That is not in itself evidence of the imperative need of diminishing the use of wood. But it does mean that a continuous future supply must be provided very much larger per capita than that which the European forests are expected to develop. We began by treating the forest as we should treat a mineral deposit, helping ourselves to whatever we wanted, with no thought of renewal. We are just beginning to treat it as a slow-growing crop, which must be and can be developed to equal our needs. But the immediate fact is that we are reaping our crop three or four times faster than it is growing up. To quote the circular already cited:

> It has been shown that the present annual cut of forest products requires at least twenty billion cubic feet of wood. To produce this quantity of wood without impairing the capital stock, our 700 million acres of forest must make an annual increment of thirty cubic feet per acre. Under present conditions of mismanagement and neglect, it is safe to say that the average annual increment is less than ten cubic feet per acre for the entire area.

That is the problem in a nutshell. From the forests in private hands is cut annually vastly more than the necessary thirty cubic feet per acre, but it is done at the expense of the future supply, a draft, so to speak, on our capital. The Government forests, which include something like one-fifth of the total, do not yet show even an excess of receipts over expenditures, though they will doubtless soon begin to do so. There is no reason why an American forest should not be brought to the point of yielding regularly thirty feet per year. The forests of Saxony have been made to supply 93 cubic feet per acre, and those of Prussia 65 cubic feet. The net revenue reported by Dr. Fernow from 15,600,000 acres of German state, municipal, and private forests lately canvassed was equal to $2.40 per acre. Our present forest reserves alone, in the remote and improbable event of their being brought to that degree of production, would pay for the entire army and navy nearly twice over.

Because the conservation of our forests is now known to be entirely practicable, the problem is by no means settled. Four-fifths of our forest area remain outside of public control. The lumbermen themselves are far more important factors in the situation than any Government experts. From this point of view, it is encouraging to see how large a part private interests have had in the remarkable forestry achievements of some of the European countries. It is customary to think of those nations as the exponents of thoroughgoing Government control. Yet statistics published in the current number of *Forestry and Irrigation* show that a larger proportion of forest area is owned by the Government in the United States than in France or Austria. Aside from Government regulation of private owners, the idea of conservative forestry has pervaded those countries as, we may say, the idea of rotation of crops is accepted by Western communities which

began by using up their rich soil without a look ahead.

In this same direction a very significant change has come about in the attitude of our American lumbermen. President Roosevelt said before the American Forest Congress two years ago that

> . . . Henceforth the movement for the conservative use of the forest is to come mainly from within, not from without; from the men who are actively interested in the use of the forest in one way or another, even more than from those whose interest is philanthropic and general. The difference means, to a large extent, the difference between mere agitation and actual execution; between the hope of accomplishment and the thing done.

It is too early to speak of the realization of that prophecy, but at least the plea of ignorant misuse is no longer heard.

OUTCOME OF THE COLONIAL CONFERENCE.

We in this country have every reason to follow with deep interest the proceedings of the Colonial Conference, now closing its sessions in London. There is involved in it a living demonstration of one of the most wonderful systems of government the world has ever known. As Mr. Balfour pointed out in his speech at the banquet given the Colonial Premiers by the 1900 Club, the history of Imperial colonization shows no parallel to the great British experiment. England herself has but slowly felt her way to the position which she at present maintains with respect to her colonies. First came control by the mother country; but this has now been abandoned. Then the right of intervention in the domestic affairs of self-governing colonies was dropped; and now we see a very "loose" connection, local independence joined with loyalty to the Empire, but a connection of a sort which really makes a greater solidarity of feeling and a more powerful whole than could result from any hard and fast system. All this is most instructive for a country just embarked on a colonial policy.

Another point which outside nations can but consider with great care is the final decision of the Conference in the matter of preferential trade. If England had departed, even but a little and only for Imperial reasons, from her settled policy of free trade, the event would have been of worldwide importance. For wrapped up in preference is retaliation. One of the Colonial Premiers frankly admitted this, but declared that England could retaliate upon the retaliators in a way to "bring them to their knees." This, however, is not so certain. Nations will suffer as much for trade rights as for any other, and a commercial war might easily be as prolonged and disastrous as one with guns and ships. Fortunately, there is no sign whatever that the Liberal Ministry will assent to the proposal to tax the products of other countries in order to swell the exports of the colonies. That path is too untried and perilous; and, besides, the Government contends that it had a plain mandate from the electorate not to place a tax upon food. Now, without a food-tax, preferential trade with the colonies is a dream. Indeed, the Chancellor of the Exchequer has explained to the Conference how impossible it is for the Government to accede to the demands of Premier Deakin of Australia.

That question has been debated in England with a good deal of partisan animus. To some Conservatives the opportunity to make party capital out of the Colonial Conference has seemed too good to be lost. To argue that if only *we* were in power, things would march much better, is an old temptation of politicians. The Tory newspapers have not been able to resist it; and have been egging the Colonial Premiers on to make an appeal over the heads of the Government. This is so obviously intended to hurt the Liberals, rather than to help the colonies, that it is not likely to be attempted. In the letter which Mr. Chamberlain sent from the South of France, regretting his absence on account of ill health, he spoke of "the only method" of binding the colonies to the Empire—namely, of course, his own scheme of preferential or protective taxes. But Mr. Balfour rose to a larger attitude when he said that he would not press upon the colonial visitors any view which would "seem to make them bear any share whatever in the controversies which divide us at home." Such wise counsels should prevail.

One of the ambitious plans of the Balfour Government was the creation of an Imperial Council. It was proposed to the colonies in the dispatch of the Secretary for the Colonies, Mr. Lyttelton, two years ago. But the strong opposition which developed then has not been lessened to-day. Canada was and remains against it. Sir Wilfrid Laurier said the other day, in an interview to be telegraphed to Ottawa:

> It is well known that my views are against an Imperial Council. I do not wish that resolutions could be passed here in England that might cause trouble in Canada.

So that project was impossible. As a sort of sop, however, the name "Imperial" is hereafter to be given to the Conference itself, no longer to be known as Colonial, and a permanent secretarial staff is to be created, under the direction of the Secretary for the Colonies, with "the duty of obtaining information for the use of the Conference, of attending to its resolutions, and of conducting correspondence on matters relating to its affairs." Provision is also made for "subsidiary conferences," in case of important matters arising which cannot be postponed to the next Conference, four years hence. Here we have a real step in advance.

Such may be reckoned also the creation of what has been called a General Staff for the Empire. The plan is to have such a staff, "selected from the forces of the Empire as a whole," which shall collect and disseminate military information, prepare schemes of defence on a common principle, and advise as to the training and organization of the military forces in every part of the Empire—"without," however, "in the least interfering in questions connected with command and administration in the respective governments." That is a ticklish point and may easily prove troublesome in practice; but the General Staff is, on the whole, an improvement on Mr. Balfour's Imperial Defence Committee, and will doubtless be pointed to as one of the definite results reached at this year's Conference. Another is the plan to establish an Imperial Court of Judicial Appeal. But no one can follow the proceedings, or read the speeches, without becoming convinced that the strength and safety of the British Empire rest, more than upon a General Staff, upon what Sir Wilfrid Laurier called the "complete and untrammelled autonomy of the component parts."

THE PROBLEM OF ELECTIVES.

In a volume, "Three Phi Beta Kappa Addresses," Charles Francis Adams gathers together his "College Fetich," 1883, "Shall Cromwell Have a Statue?" 1902, and "Some Modern College Tendencies," 1906. Mr. Adams notes in his preface that many people have assumed a divergence of view between his speech at Harvard in 1883 and that at Columbia last year; and he adds that, had he changed his opinion, he would "not for a moment have hesitated in giving utterance to the later and more matured beliefs; for consistency in these matters is apt to be indicative of little else than either an inability or an unwillingness to observe and to learn." He protests, however, that "in this particular case there was no inconsistency." We may accept the book, then, as the formulation of Mr. Adams's creed on education. He is not a professional teacher; and yet he is hardly an amateur, for during more than half of the fifty years since his graduation from Harvard he has served on the Board of Overseers and he has taken the keenest interest in the problems that have come before it. Inevitably, his comments apply with special force to Harvard, but much that he says is also pertinent to the small college and to the Western State university.

The gist of his arraignment of present conditions is contained in a Supplementary Note to his last address; here he sums up his points and answers his critics. He declares roundly:

> The existing American academic system and its logical tendencies as of late developing under the exigencies of growth, are . . . fundamentally and structurally wrong. The material organization . . . is radically out of date and defective; the soundness of the educational methods in use are very open to criticism.

These are sweeping charges. No one, however, can deny that the college curriculum is chaotic. We have discarded the old hard-and-fast required course, and we are passing to greater or less freedom of electives. We are experimenting with groups of studies, with required classics and mathematics in the freshman year, with required English for two or three years, with a requirement of a single course in science, chosen from a dozen, and so on through many permutations and combinations. The result, Mr. Adams thinks, has been "an unscientific anomaly—something neither American nor English, nor yet German." He maintains that a boy of seventeen or eighteen is not "the most competent judge of his own intellectual structure and educational needs"; and that the so-called freshman advisers are "only in degree less immature." As evidence of the weakness which the elective system has developed in practice, he points not merely to the direct efforts to limit it, but also to the attempts to supplement it by manning the large and popular elective courses with a body of instructors and preceptors. This remedy also, Mr. Adams argues, is likely to be inadequate. The outcome to which he looks in the remote future is "the sublimated academy—the family, or cluster, of independent schools together constituting the college, and the college the gymnasium preparatory to the university." Harvard, for example, might break up into a group of colleges, "each with its own head, and not so large as to make it impossible for that head, not as a specialist, but as a friend and preceptor, personally to influence the individual student."

The argument that what Mr. Adams proposes is the English system, and is therefore un-American, is, of course, irrelevant. The question is whether the plan, by whatever name it be called, would be useful. On the side both of intellectual and moral discipline, such small colleges as Mr. Adams describes have much to commend them. The most loyal son of Harvard would admit that Cambridge may not be the place for every boy. There are lads who would be lost in the crowd there. If we agree with Mr. Adams that character-building should be the highest function of the college, we cannot but grant also that certain youths of seventeen or eighteen might fare better under the fostering care of the smaller and more compact institutions. On the contrary, the very size of Harvard and Yale is often a stimulus to those who from boyhood are robust and self-reliant. We cannot imagine Mr. Adams, for instance, as being submerged by mere numbers.

But aside from the relative advantages of large colleges and small—and the vital question here is rather as to the quality of the individual boy and his special needs—the problem of electives still confronts us. The small college as well as the large must have its electives, for the simple but cogent reason that the field of modern knowledge is so wide. The sciences, history in all its branches, economics, philosophy, modern languages, the classics—and so on through the almost endless list—furnish an educational programme from which no rigid prescription can be made for those who want a general education. To lay out a curriculum for a professional training is relatively easy; but in this whole country there is not a faculty which would vote with even an approach to unanimity for a purely collegiate, prescribed course of three or four years. This difficulty President Eliot pointed out thirty years ago, and time has strengthened his argument. Mr. Adams himself sees the barrier:

> Would it not, for instance, be practicable as well as best for Harvard to have different colleges giving different degrees for different courses of study, all to feed the university? . . . Why insist on one baccalaureate degree and one term of study?

Why, indeed? But the immature boy of seventeen, advised by some one "only a degree less immature," must still make the choice between the several small schools, or colleges. He must accept the elective system in one shape or another; and Harvard, whether as a single college containing several thousand students, or as several colleges containing a few hundred each, would be much the same thing. The form which Mr. Adams proposes may or may not help to lighten the troubles of deans and disciplinarians. In the meantime, we must muddle along with some kind of elective system.

NATURALISTIC HISTORY.

"Tell About that I am going to write the 'Révolution' as I wrote the 'Ancien Régime,' *en pur naturaliste*." So wrote Taine to Francisque Sarcey in 1876. The letter from which the extract is taken, together with a number of others, is published in the mid-April number of the *Revue des Deux Mondes*. It is an interesting and instructive correspondence, letting us, as it does, into the mental workshop of Taine in the years when he was at his arduous labors as an historian. We see him taking infinite pains; going down among the dead men in the archives; passing laborious days in tearing the heart out of provincial records and the letters of the little-great men of country towns; appealing to friends to assist him in verifying his facts and clearing up his puzzles. The personal impression of the man is throughout most attractive. His high zealousness is vividly revealed. He knew that he was about to shatter certain national idols, yet he held on his way with admirable devotion and courage. He wrote to his mother in May, 1876: "The French Revolution, studied at close range and by means of authentic documents, is very different from what people believe; so I have to be exceedingly careful, for it is a religion, and they will fall upon me as upon a blasphemer."

Taine's theory of the true method of writing history is brought out again and again in these letters. Never was there such a glutton of facts. His desire to be "documented" amounted to a passion. Nothing was so minute as not to be worth his scrutiny. He professed complete detachment of spirit. All exhortation and drawing of morals and polemic intention, with all reflections upon present politics seen in the light of the past, he resolutely put far from him. He seemed to think that if he could only drench himself in the facts, he could write the ideal history.

It is a question, however, whether Taine, or any other historian, could ever wholly avoid what Browning called "the instinctive theorizing, whence the fact looks to the eye as the eye likes the look." Indeed, it is clear that Taine brought preconceptions to his wide and patient study of the dry details. He was but partially aware of this, yet the admission tacitly escapes him in these letters. Writing to Anatole Leroy-Beaulieu, he said: "In me, the historian is tinged with the psychologist." The author of "The Revolution" could not get away from the author of "The Intelligence." Thus he long strove to penetrate the real mind of the Jacobins. "Let me once frame the true psychology of a Jacobin," he cried, "and my book is written." Yet, with Taine, psychology and even morals always tended to translate themselves into the terms of the physical sciences. So his analysis of the mental state of a generation insensibly passed into that of its pathological condition. He began to talk about the "imperfect organization of France," as at once "apoplectic and anæmic." Thus he gave one proof more of the truth of Lord Acton's dictum, that the mere amassing of facts never made a great history; that erudition, however amazing, can never take the place of the critical faculty; and that the presiding and interpreting mind of the writer must always count for more than all the doc-

uments which he can drag out of Simancas, or the Bibliothèque Nationale.

Taine, of course, was a great literary artist, as well as delving student. His lurking fear was that his heaping up of proof and close following of his authorities might impair the æsthetic quality of his work. To Gaston Paris he wrote in 1881 inviting criticism to three points in his history: "(1.) Is it sufficiently novel? (2.) Is it sufficiently proved? (3.) Is it sufficiently literary?" On this last head, Taine confessed to having painful doubts. And we think the general opinion would justify them. All his writing was, of course, marked by neat precision of phrase and delicate verbal distinctions; but his material too much overbore him in his historical writings, and he often has the air, not of a great narrator in a fine glow, but of a dry professor making an anatomical demonstration. He was aware of this danger, and held steadily before his eyes the examples of the grand manner. Among these, he reckoned Macaulay, at whom it has been the recent fashion to sneer. But Taine spoke with keen admiration of his blending of industry and imagination. "Macaulay," he wrote, "was able to be an exact critic and complete artist (the siege of Londonderry, the state of Ireland in 1690, the portrait of William III.)."

The "naturalist" school of historians has done a valuable work, and had a great influence; but its day seems now to be passing. The limitations of the method have become apparent, while, from a literary point of view, the frequently repellent nature of the results attained has been a weariness to the flesh of many. The whole battle of the rival systems is amusingly rendered in Frederic Harrison's well-known skit on "The History Schools." In it he sets before us the "Freemanikins," struggling with their palisades at Senlac and their Ecgfriths, and maintaining that "in history you cannot trust a fellow who tries to be interesting. If he pretends to be philosophical, you may know him to be an impostor." There were also the disciples of Froude, going in stoutly for "literary history," and so much the worse for the facts if they were not what you thought them. Keeping the safe middle course was the shrewd lawyer of the dialogue, who held that "no research and no insight, no labor and no subdivision of labor, will ever enable you to reach the literal and particular truth about every minor incident"; that "the microscopic eye, with its power of ten thousand diameters, will, after all, only show an infinite series of minute specks." His advice to the young man "going into the historical line" was not very unlike that which Taine would have given. Not advice, but practice, is the hard thing in these matters. The recommendations of Mr. Harrison's Q. C. (himself in thin disguise) were as follows: "First, indefatigable research into all the accessible materials; secondly, a sound philosophy of human evolution; thirdly, a genius for seizing on the typical movements and the great men; and, lastly, the power of a true artist in grouping subjects, and in describing men and events." The recipe is not bad; but first catch your historian.

BOOK NOTES FROM SWEDEN.

The most important scientific and literary centre in Sweden, next to the capital, is Upsala, with its university. The dissertations which its students present for their degrees cover a large field and are often important contributions to science; and the monographs collected under the cover of its *Årsskrift* are written by scholars of repute. An interesting picture of this activity is presented in the new "Upsala Universitets Matrikel," which gives, in addition to a list of officers and instructors, the titles of books and articles written by them. Nine or ten scientific and literary periodicals are issued under the auspices of the university and its institutions, among them the new organ of Oriental research in all its branches, *Le Monde Oriental*. In the way of minute research there are also several so-called *Festschrifte*, which are published on the occasion of the birthday or other anniversary of some well-known scholar. Several such volumes have lately been published in honor of Upsala professors: "Studier tillägnade Henrik Schück på hans 50-årsdag d. 2-Nov., 1905"; "Festschrift Olof Hammarsten zu seinem 65sten Geburtstage den 21-sten August, 1906, gewidmet"; "Botaniska Studier tillägnade F. R. Kjellman den 4 November, 1906." Among the learned societies in Upsala there are four or five whose publications are of considerable value. Then, too, there is Vilhelm Ekmans Universitetsfond, a fund of 100,000 kronor for the publication of scientific works. With this subvention a number of volumes have been issued, and two more works are now in course of preparation: a catalogue of the incunabula of the University Library in Upsala, by D. I. Collijn, and, in cooperation with Kungl. Vetenskapssocieteten, a work on runic inscriptions, by Prof. O. von Friesen. Among the larger scientific works undertaken by professors in Upsala mention is due to Adolf Noreen's grammatical work "Vårt Språk," G. Rydberg's "Zur Geschichte des Französischen," N. J. Göranson's "Undersökning af Religionen," W. Sjögren's "Förarbetena till Sveriges lag 1686-1736," "Corpus inscriptionum Etruscarum," which is now edited by Prof. O. A. Danielson. The second part of Henrik Schück's "Världs-litteraturens Historia," devoted to the literature of Israel, receives its greatest value from its being the first comprehensive study, in the Swedisb language, of this important subject.

Turning now from Upsala to Stockholm, we should first mention the annual report of the Nobel committee, "Le prix Nobel," of which the volume for 1903 has just been issued. These reports contain, besides the account of the festivities in connection with the awarding of the prizes, the public lectures which are usually delivered in Stockholm by the laureates. To celebrate the 200th anniversry of the birth of Peter Artedi, the naturalist and friend of Linnæus, the Academy of Sciences in Stockholm has issued a memoir of his life and work, by Prof. Einar Lönnberg. This book has been translated into English. The Nobel Stipendiate, Prof. S. Arrhenius, published recently, under the title "Väldarnas Utveckling," a popular exposition of his investigations, beginning with a chapter of current interest on seismic and volcanic phenomena, and ending with a statement of the author's hypothesis of the "life seed." Prof. Axel Kock in Lund is at work with a large phonetic work, "Svensk Ljudlära," of which two or three parts have appeared. Gustaf F. Steffen, known to English-speaking readers through his work on the development of wages among English laborers, publishes a series of smaller sociological monographs, under the common title Sociala Studier, in which he intends to "explain the origin of modern society, its most important characteristics and tendencies, and the most urgently needed reforms." Among the subjects treated in the first four parts are "The School, Society, and Sociology," "The State, Society, and Culture," "The Principle of Social Politics in Taxation." Prof. Vitalis Norström, the new member of the Swedish Academy, and one of the most vigorous philosophical thinkers in Sweden, offers in his latest work, "Den nyaste människan," a criticism of modern culture from a conservative, yet progressive point of view.

The northern half of Sweden, Norrland, is attracting attention, not only on account of its industrial possibilities. The educational and intellectual needs of its population are being more and more appreciated, as several publications bear witness. Among them are the illustrated work, "Lapland," edited by Bishop J. O. Bergquist and Dr. F. V. Svenonius, and a series of smaller tracts published by a society of students, scientists, authors, and artists, called Norrländska Studenters Folkbildningsförbund. A larger undertaking, with wider scope, is Norrländskt Handibliotek, intended to give, in a number of good-sized volumes, a complete description of this part of Sweden. It is edited by Prof. A. G. Högbom, who has written the initial volume, a description of the geology and physical geography of the country, with an introductory chapter on the history and literature of its discovery. With Norrland literature must also be counted O. Högberg's "Den Stora Vreden," a collection, in three volumes, of legendary and anecdotal material for the history of Norrland in former days, woven round a story of the lives of a few well-known characters from the beginning of the eighteenth century.

In biography we meet the posthumous fragment of the late Oscar Levertin's work on Linnæus, four chapters only, giving an account of his childhood and school years, and an estimate of him as poet and moralist. Though Linnæus wrote hardly a line of verse, Levertin finds in his more informal productions, especially letters and books of travel, qualities indicating a poetical nature. E. Wrangel edits correspondence between Tegnér and C. G. von Brinkman with a biography of the latter and run-

ning comment. Teofron Säve devotes a book to the life of John Ericson. G. Collijn, a young Upsala student, has written a large volume on the Austrian poet and dramatist Franz Grillparzer, with interesting expositions of his dramas and many translations. Another work on a foreign poet is E. Björkman's "Geoffrey Chaucer," in the series of popular lectures at the University of Gothenburg. In the same series Otto Sylwan publishes his "Den Moderna Pressens Historia," the first history of the press throughout the world.

The third volume (in two parts) of Ellen Key's "Lifslinjer" develops further her well-known individualistic philosophy, in essays—"The Sympathy of Self-Glorification," "The Moral Law of Beauty," "World Nationalism," etc. John Landquist is a young critic who in "Filosofiska Essayer" has collected a number of studies in philosophy and psychology, of which the essay on "Thinking with the Sensations" seems most important; he writes also of Ibsen, Strindberg, and Weininger.

In fiction we meet again the name of Oscar Levertin on the title page of a volume of his "Last Stories," most of which have been printed before in various places. Strindberg offers in his "Nya Svenska Öden" a new series of historical novelettes. But the most conspicuous work of fiction of the season has been Selma Lagerlöf's fanciful description of Sweden, entitled "Nils Holgerssons Underbara Resa genom Sverige." The book, which was written to the order of her publisher to meet the demand for a popular supplementary reader for the public schools, has aroused general admiration. Per Hallström's "De fyra Elementen" is a collection of short stories written in a rather sombre yein. The first, "Mute," is a story of two young people who part in mistaken pride and harshness, to meet again only after she is the wife of another. Other new works of fiction are Hugo Öberg's "Makter" and "Allt under Himmeleris Fäste," which seem to indicate a departure from the decadent mannerism of the youngest writers; the historical novels "Drottning Margareta" by Axel Lundegård and "Konungen" by Sophie Elkan, the last named having for hero the deposed King Gustavus IV. of Sweden; Gustaf Janson's "De första människorna," the story of a shipwrecked family on an uninhabited island, and their life in paradisic innocence; K. E. Forsberg's "Göran Delling"; G. of Geijerstam's "Bröderna Mörk"; P. Hallström's "En Skälmroman"; N. W. Lundh's "Mars"; Anna Åkerhjelm's "Den stora Lyckan"; Hjalmar Höglund's "Skogsinspektören"; Mari Mihi's "Studentens Lyckliga Dar," a collection of stories of Upsala student life in the nineties.

The season has brought many interesting poetical works: E. A. Karlfeldt's "Flora och Pomona," in this author's quaint, old-fashioned manner; Ellen Lundberg's "Sånger och Syner"; Sigurd Agrell's "Hundra och en Sonnett"; Bernhard Risberg's "Vallno och Blåklint"; Oscar Mannström's "Rös och En"; Johan Skog's "Blad." Arthur Möller has collected, in a small volume entitled "Unga Poeter," a number of poems by some of the youngest of Sweden's lyric poets: K. G. Ossian-Nilsson, Sven Lidman, Sigurd Agrell, Anders Österling, and others.

Only three dramas were published during the year: "Ett Hems Drama," by Tor Hedberg; "Nattens Röster," by Anders Österling; and Hjalmar Söderberg's "Gertrud," this author's first effort in this branch of literature.

Of translations, E. Lundquist's of Benvenuto Cellini's autobiography, A. U. Bååth's of mediæval student and tramp songs, "Vagantsånger," and S. Bring's of Dante's "Divina Commedia" deserve mention; the latter received the Letterstedt prize of the Swedish Academy of Sciences.

Two new magazines have appeared with the new year: *Det Nya Sverige*, edited by Adrian Molin, intended as an exponent of the new national and progressive movement in Swedish politics, though open to writers of all parties; and *Bonnier's Månadshäften*, a general illustrated magazine.

Two important reference books are being published in new editions: "Nordisk Familjebok," the well-known encyclopædia, which now appears with numerous illustrations and otherwise much enlarged; and "Hofberg's Svenskt Biografiskt Hand-Lexikon," just completed and increased to twice its original size, with numerous portraits, many from old and rare prints.

The separation from Norway and the increasing demands for a democratization of the government have given rise to a vigorous political discussion, in the newspaper press, at public meetings, and in books. The most important of the books are: Adrian Molin's "Svenska Spörsmal och Kraf," Rudolph Kjellén's "Nationell Samling," Fridtjuf Berg's "Inför Genombrottet," and Carl Lindhagen's "Drömmar och Stridslinjer."

One of Sweden's last Catholics, Olaus Magnus, published during his exile, in Rome, in the year 1555, his "Historia de Gentibus Septentrionalibus," the first ethnographical description of a European people. Not less than twenty-one editions of this work appeared from 1555 to 1669, eleven in Latin, the others in Italian, French, Dutch, German, English, but no Swedish translation has yet been issued. A small club of scholars and bookmen, called Mikaelsgillet, has now undertaken to prepare a Swedish edition of the work, and the first volume is expected to be ready on June 6, when the new building of Nordiska Museet will be opened to the public. The translation is by Robert Geete and will occupy three volumes, with a fourth of illustrative notes prepared by Claes Annerstedt, E. W. Dahlgren, Hans Hildebrand, Oscar Montelius, A. G. Noreen, and others. The typographical make up of the work is in charge of I. Collijn; it will imitate that of the 1555 edition, and contain all the illustrations of the original edition.

A. G. S. Josephson.

NEWS FOR BIBLIOPHILES.

What is probably the best collection of the mouments of Shakespearean bibliography ever exhibited in this country is now on view at the library of Columbia University. With the exception of one volume, the not very valuable copy of the first folio owned by the university itself, all the books exhibited have been loaned by a single collector, who modestly withholds his name. An hour spent over the cases, which contain only a portion of his treasures, will give one a fair idea of what American wealth and taste and knowledge are doing to secure for this new country a fair share of the world's artistic and bibliographical wealth.

The most valuable item is the exceptionally perfect copy of the first folio. The copy of the second folio is only fair, the third is missing, but will be supplied from another collection, the fourth is represented by an excellent copy. Of the quartos there is a large and interesting assortment —the 1594 "Lucrece"; the 1598 "Love's Labor's Lost," with two later ones; three of "Romeo and Juliet," "Richard II.," " I Henry IV.," "Hamlet," "Richard III.," and "Pericles," respectively; "Much Ado" (1600); the second of "Troilus and Cressida" (1609); four of "Othello"; and about ten others. There is a good copy of the "Sonnets" (1609), and, indeed, one is struck by the excellent condition of almost every volume exhibited.

Probably the most attractive case is that containing the contemporary books that allude to Shakespeare or illustrate passages in his works. Here are "The Returne from Parnassus," Chettle's "Englande's Mourning Garment" (Collier's copy), "England's Parnassus" (three copies), the apparently unique copy of the first edition (1592) of Greene's "Groatsworth of Wit," Meres's "Palladis Tamia," and, last but very far from least, the second edition—a beautiful copy—of "Tottel's Miscellany." And all this represents only about a third of the contents of this single case. A similar but smaller division of the exhibition shows us among other interesting volumes, two copies of Paynter's "Pallace of Pleasure." The bibliophile will look with envy upon a large paper copy of Ben Jonson's "Sejanus," while the lover of poetry will probably get greater pleasure from a glimpse of Suckling's "Fragmenta Aurea." A number of volumes fall under the head of *curiosa*, there is a good collection of the attributed plays that lie outside the accepted canon, and the adaptations by Dryden, Tate, Shadwell, and others are well represented.

On May 13, the Anderson Auction Company sells a collection of Americana belonging to a Long Island collector whose name is not made public. Few notable items are to be found in the catalogue, which includes sections on the Civil War, Indians, Abraham Lincoln, New York, War of 1812, and a curious series of American Song Books, mostly of the Civil War period. On May 14, the same house sells another lot of duplicates from the New York Public Library, mostly Americana, some being from the Duyckinck and Bancroft collections. Their sale of May 15 is quite miscellaneous in character, but includes an unusual series of books on such subjects as Astrology, Magic, and Buddhism. A collection of autograph letters formed by Dawson Turner (1775-1858), containing upwards of fourteen hundred specimens, bound in ten volumes quarto, is an unusual item.

On May 13, the Merwin-Clayton Sales Company sells a collection of autographs and manuscripts, including a letter signed by Washington, dated December 20, 1778; a war telegram by Grant, a Franklin document, slave deed, dated 1690, etc. There are letters by Longfellow, Holmes, Lowell, Emerson, Prescott, Charles Reade, Goethe, Voltaire, and others. Among manuscripts are: T. B. Aldrich (a stanza, four lines,

signed); Matthew Arnold (his lecture "Common Schools Abroad," 34 pages); Alphonse Daudet (his story "L'Odyssée du Brise-Cailloux," 5 pages); Southey (a poem "Epitaph in Burleigh Church," 3 pages), etc. On May 14, they sell a collection of Americana, including a copy of Mr. Bixby's privately printed "Private journal of Aaron Burr"; books on the Revolution, Arctic exploration, the Civil War, Indians, Lincoln, New York, New Jersey, etc.; books on the West, including California, Texas, and Colorado, etc. On May 17, they sell three hundred and four lots of early printed books, mostly relating to the History of the Reformation. There are eight items by Calvin, thirty-two by Luther, ten by John Cochleus, the famous adversary of Luther; eight by Erasmus, eleven by Ulrich von Hutten, nine by Melanchthon, eleven by Zwingli, etc. The copy of the Heidelberg Catechism printed at Emhden in 1565 is the only copy known. One of the most interesting items is a copy of the 1516 edition of a curious pamphlet, with the title: "De Generibus Ebriosorum et Ebriotate vitanda," which relates to the drinking customs of the German universities. On the title-page is a wood-cut showing a drinking party of nine animals (ass, pig, calf, sheep, dog, wolf, bear, monkey, and goose).

On May 30, Sotheby sells a small collection of manuscripts, including letters of John and Charles Wesley, Gilbert White, John Flaxman, Swedenborg, Dickens, Thackeray, Darwin, King Edward VII. as Prince of Wales, etc. The most interesting item seems to be Sir Francis Drake's own copy of a contract for war provisions, shipping, etc., for the Low Countries, dated October 12, 1588. It is partly in his autograph, and is signed by him.

Correspondence.

INTELLECTUAL FREEDOM IN THE SOUTH.

To the Editor of The Nation:

Sir: In the *Nation* for April 25 appears Prof. W. E. Dodd's communication on "Freedom of Speech in the South," in which he says:

> There is not in all the Southern States, between the Potomac and the Mississippi, a chair of political science; and the interest in sound instruction on political subjects is so weak that there is no agitation anywhere for the establishment of such departments.

If Professor Dodd's first sentence be modified by adding to "political science" the word "exclusively," the statement will probably be correct, not only for Southern colleges, but for most of those in the North and West. On examining the various college catalogues it will be found that the same man often teaches "history and political economy," or "economics and political science," or "history and political science," or "economics and sociology." Forty years ago a course in "political philosophy" was given in the South Carolina College. To decide at present just what is "sound" instruction in politics would perhaps be somewhat difficult if the decision were referred to a committee of three made up of a Republican, a Democrat, and a Socialist. It might also be a little hard to determine the limit at which a strong desire passes into agitation. The existence of the desire in many colleges could be easily proved, but the weakness is in regard to money.

In 1898 the late William L. Wilson, whose name is associated with a tariff law that gave place to the present Dingley abomination, was president of Washington and Lee University. He insisted on the establishment of a chair of economics and political science for the maintenance of which no funds were visible. During the year prior to his death in 1900 he paid the salary for the most part from his own pocket. The chair was subsequently endowed in memory of Mr. Wilson, and has been expanded into a "school of commerce" which has over two hundred students enrolled and occupies the entire time of a professor and an adjunct professor. There are two courses in economics, two in politics, and four in commerce, each occupying three class hours per week throughout the scholastic year. One of the subjects of instruction is "Modern Tariff Systems," in which the Dingley system is treated impartially. The head of the department is a Northern man and his associate a Virginian. Courses of instruction in political science are offered in Tulane University and in the Universities of South Carolina, Georgia, and Tennessee. The University of Virginia announces that "a full professor of economics" has been lately appointed. Whether his duties are to include political science will probably be made known in the next annual catalogue.

It is readily conceded that the educational condition of the South is still much behind that of the North, and that it will continue so as long as the concentration of wealth is chiefly at the North. Conservatism is always irrationally strong where people have not the opportunity to mingle freely with the rest of the world. The provincialism of Massachusetts was quite as noticeable as that of Virginia a century ago. Freedom of thought and freedom of speech are inconsistent with provincialism, but the South is not at a standstill in this respect. The present writer moved to the North thirty years ago because of the shackles to which he was subjected in his Southern home. He came back as far as Virginia nine years ago; and he finds such changes, either in himself or his surroundings, that contentment is quite possible. There are many sources of unhappiness that have their origin in human nature much more than in sectional peculiarities. Slavery to corporations at the North is to-day much worse than negro slavery was to the negroes as the writer remembers it in his childhood. Nobody wants to restore negro slavery, and nobody can change the essential character of an unfortunate race. Intelligent people in both sections are perceptibly more liberal toward each other to-day than they were during the national "brain storm" of Reconstruction times, and the spirit of self-criticism is developing at the South, as well as elsewhere. There is still abundant room for improvement, especially in regard to theological prejudice, but a professor is now tolerated where a generation ago his head would have fallen. Let us be at least just and give full credit where credit is due.

W. Le Conte Stevens,

Washington and Lee University, Lexington, W. Va., April 28.

LYDGATE IN THE "OXFORD TREASURY."

To the Editor of The Nation:

Sir: There has appeared in the course of the last few months the first volume of the "Oxford Treasury of English Literature," edited by G. E. and W. H. Hadow of Oxford. It is regrettable that this volume, which purposes to popularize the poems and prose from Beowulf to James I., should not have been based on sound modern scholarship. May I call your attention to the injustice done John Lydgate, for example?

This poet is represented by extracts from the "Horse, Goose, and Sheep," a dull, didactic debate of Lydgate's old age (1437-8?), and by the "London Lickpenny," erroneously entitled "Lackpenny," following Halliwell's wrong guess, in his edition for the Percy Society, 1840 ("Minor Poems of Lydgate"). Miss Hammond's two-text print of this poem is entirely neglected. Her study shows that at some time in Elizabeth's reign a copyist revised Stow's copy, which was in eight-line stanzas, and rejected one line in each stanza (often to the detriment of the sense), bringing the poem to a rhyme-royal form. It is from this corrupt and defective text that the poem is printed, and ascribed without question to Lydgate, in complete disregard of the views of Ten Brink, Brandl, Koeppel, and most of all, our own Miss Hammond, who all pronounce the poem spurious.

Page 138 of this volume is devoted to a note on Lydgate, from which I cite the following errors:

(1.) "Educated, in all probability . . . at Gloucester Hall, Oxford." There is only the slightest possibility, and no probability at all for this statement. Shirley, the famous scribe, in his untrustworthy MS. Bodleian Ashmole 59, says that one fable of Lydgate's—"The Dog and Cheese"—was "made at Oxenforde." The poem, however, gives evidence of being of late composition. To argue from this that Lydgate must have received his education at the Benedictine Hall of Oxford, is unwarranted.

(2.) He "opened a school at Bury." There is no warrant for this statement whatever. The late bibliographer, Bale, is the only authority for it.

(3.) "He was well acquainted with Chaucer." Lydgate knew Chaucer's poems by heart, almost, but there is no evidence that he ever saw the "chief poete of Britayne."

(4.) "Early in the fifteenth century he was introduced at the court of Henry IV." Again, there is no evidence for this statement.

(5.) "On the accession of Henry VI. he was appointed Court Poet." This is mere fabrication, for the title implies a laureateship. Lydgate wrote mummings and ballades for the young king and his mother, as he did for the citizens of London.

(6.) "From 1423 to 1434 he was Prior of Hatfield Regis." Lydgate gave up this priorate before 1431. John Derham's name appears as prior of this place in this year. See Anglia, xv., 390ff.

(7.) "Among his lighter poems the most famous is the 'London Lackpenny,' written in his favorite metre, the rhyme royal, and showing far more ease and flexibility than he ever attained in his heroic verse." Wrong in every particular. The poem is

not Lydgate's, it was not written in the rhyme royal, it does not show more ease than the "Story of Thebes," for example, and its name is "Lickpenny."

(8.) To call a tract occupying only eight folios of a quarto MS., a "volume in prose," is somewhat misleading. We do not know that "Lydgate" entitled (this tract) "The Damage and Destruccyion in Realmes," we do know that he refers again and again to "The Serpent of Division," by which name the piece is generally known.

It would perhaps be too much to expect the editors to have secured the latest opinions of the learned, such as those of Professor Schick of Munich and Dr. Furnivall, who now believe that the "Court of Sapience" and the "Assembly of Gods" are spurious. Both these poems are unhappily cited as specimens of Lydgate, while the "Fabula Duorum Mercatorum," the "Complaint of the Black Knight," "Temple of Glass," and the "Pilgrimage of the Life of Man" (25,000 lines)—to name but a few—go unmentioned.

HENRY NOBLE MACCRACKEN.

Harvard University, April 25.

TRUANCY IN CHICAGO.

TO THE EDITOR OF THE NATION:

SIR: Referring to that perpetual plague of truancy in public school administration, Superintendent W. H. Maxwell of New York, in the *Nation* of April 25, compares the methods employed in New York with those of Chicago. Judging from statistics, the Chicago plan would seem the more efficient. This, Dr. Maxwell thinks, is because of the superiority of the Illinois law. Perhaps it would be nearer the truth to say that public opinion in Chicago is more fully aroused than in New York, as the result of painful experiences which the latter city has been spared.

For many years the truancy problem was simply ignored; there was, in theory, no such thing as a truant boy; or, if there was, he was a negligible quantity; the evil, if such existed, would cure itself; possibly there might be negligent parents and wayward children in other cities, but in Chicago it was different; there all boys were naturally good, and all parents were conscientious; the previous experience of mankind was futile and unworthy of consideration. The rod and all suggestions of force and compulsion were abolished as a relic of barbarism; unruly and troublesome boys were "suspended" (that is, simply turned out into the street); children who did not care to go to school were permitted to stay out; parents who failed to appreciate the blessings of a gratuitous public education for their offspring, were allowed to do as they liked with their own. This was a free country, and why not?

The experiment was tried, and in a few years the results were illuminating. The public gradually came to see that the town was becoming one of the most turbulent and lawless in the country. Riots, massacres, strikes with bloodshed, highway robbery, and assaults on women and children furnished the needed object lessons.

In a lucid interval the Legislature was persuaded to pass a stringent truancy law, and this law has been rigidly enforced in Chicago. Under this law the parent is required to show affirmatively to the satisfaction of the court, that he has used his best efforts to send the child to school; otherwise, fine or imprisonment follows. The burden of proof is on the parent to show that he has done his duty to the community by sending his child to school, either public or private. In the absence of reasonable evidence to the contrary the court assumes that an able-bodied man can control his minor children. A twenty-five dollar fine or two months in jail, it has been found, has a wonderfully vivifying influence on negligent and indifferent parents. The rising generation is being coerced into a respect for law and order. To the impartial student of affairs it seems a pity that the public can learn in no other school than that of harsh experience.

Chicago, Ill., April 29.

AN OXFORD VIEW OF MUSIC.

TO THE EDITOR OF THE NATION:

SIR: Your musical notes of April 11 are very interesting to one who, like myself, has long resided in Oxford and has the pleasure of knowing both Dr. Ernest Walker and Mr. W. H. Hadow. Dr. Walker as "a bull in a china shop, smashing everybody's favorite crockery," sounds most engaging, and I shall look forward to reading his article on the Oratorio in the new "Grove." Neither Handel nor Liszt is *my* favorite crockery, as it happens, and we all know what Dr. Walker has done in imbuing successive generations of pupils with the love of that supreme musician, Johann Sebastian Bach.

When I come to your critic's remarks on Mr. Hadow's attitude towards Grieg and Chopin, however, I am completely in sympathy. Mr. Hadow's services to music are very great, but why his tone of the infallible don towards such spontaneous geniuses as Grieg and Chopin? With me it arouses an almost personal indignation, for both these children of nature have spoken to my heart and to my imagination. The heart, however, is not fashionable in Oxford society, where they cultivate *die reine Vernunft*. If only Dr. Schiller were a musician, he could show us how fatal this must be to the perception of real music in all its manifestations. Catholicity in art, in life, in religion—that is the crying need of our age. Oh, for an hour of the days of my youth, when I sat at the feet of Sir George Grove and Canon Ainger! Then we were allowed to enjoy *everything* that was good.

I do not comment upon the remarks of Prof. Edward Dickinson about Schubert, as happily they could not be endorsed by any Oxford musicians, and certainly not by Mr. Hadow.

I do not speak as an expert, but as a mere amateur in music and in philosophy.

Oxford, England, April 23.

SMUGGLING WORKS OF ART OUT OF ITALY.

TO THE EDITOR OF THE NATION:

SIR: Referring to your very just remarks in the *Nation* of April 25, about the transfer of Italian masterpieces to America, permit me to add that a great part of the evil might be checked, so far as the actual alienation of these works is concerned, by means of an honest frontier or port inspection of all outward bound shipments. People who smuggle things of this sort out of Italy without intermediary aid are either wealthy dealers or private collectors, who are willing to run the risk of having to unship their treasures and present them at the nearest Government museum for appraisal; or they are collectors who, in the full realization of this risk, prefer to place the work in the hands of men who will, at an exorbitant rate, transmit almost any work of any size or value from a specified town to the desired destination.

One of the most important of these industries is at Naples, where for nearly a generation this profitable but most questionable trade has flourished. There is a comparatively simple but effective system of presenting at the museum a series of dummy cases, facsimiles of those really to be shipped; and, when the valueless content of the former is declared to be legally exportable, the expresser causes the seals and tags to be shifted from the dummy to the real case, which then passes the harbor inspectors.

As soon as this type of freebooting shipment becomes extinct the present exodus of Italian works of art will be at once checked. The pity of it is, that this can flourish under the very eyes of the authorities at both Naples and Rome. It needs the corrective action of highly placed officialdom to crush it. So far, indifference, friendship, and other causes combine to maintain this thriving trade.

T. D. B.

Cambridge, Mass, April 26.

Notes.

The J. B. Lippincott Company have in hand a version of Fogazzaro's "Malombra," to be called in English "The Woman." It is a tale of romantic mystery, a beautiful work in the original.

Next week Robert Grier Cooke will publish Rosina C. Boardman's quarto volume on "Lilies and Orchids." The volume contains twenty-four colored plates and promises to be a handsome production.

The Bibliographical Society of America announces the forthcoming publication of a Bulletin, which, besides being the official organ of the society, will contain a record of current American bibliographical work. It is intended that it shall include a list of bibliographical studies which members of the society or others have under way; this will be useful as a means of preventing duplication of work.

Blond et Cie. are publishing a study of "Ferdinand Brunetière," by Prof. Victor Giraud, containing recollections, notes, unpublished scraps, and a portrait. The same house has ready Oscar de Ferenzy's "Vers l'union des Catholiques."

A voluminous manuscript of Ibsen's, written before 1864, has come to light. It contains an epic poem of some 20,000 words, in which are found many of the ideas later developed in "Brand" and other dramas. The manuscript was left by Ibsen in Rome in 1864, and after various vicissitudes has

come into the possession of Prof. Carl Larsen of Copenhagen, who will publish it.

In Paris an association has been organized for the purpose of erecting "university houses" for students, not only in that city, but in all the larger educational centres of the republic. The city government favors the innovation and is coöperating with the association in building the first structure of this kind in Paris. The university house is to be a students' home, in which the students of all the faculties can secure lodging and sleeping apartments, find libraries, bathrooms, and the like. A leading purpose is to counteract the evil influences surrounding student life in Paris especially in the Latin quarter.

A country school for town children, a recent outcome of the interest in education in England, has proved so unqualified a success as to invite imitation in this country. A building has been provided by private gifts in the neighborhood of Manchester, where 120 children are housed, fed, and educated for a fortnight on payment of $1.75 each. They are accompanied by their regular teachers, and the instruction follows the ordinary elementary school curriculum. One thousand six hundred children will be received this summer.

The establishment of girls' schools is the latest development of the educational progress in China. An imperial decree, published April 11, says that normal schools are to be founded first in the provincial capitals, afterwards in the prefectural cities, and later in the country cities; the primary schools are to be established everywhere. These are to be Government schools mainly, but the foundation of private schools, subject to official inspection, is also encouraged. Foreign women teachers as well as native may be employed. Apparently in imitation of Japan, the regulations forbid pupils to use silks, satins, cosmetics, and jewelry, and enjoin a simple mode of dress. They exhort the abandonment of the "cruel and injurious" practice of foot-binding, and gymnasiums and exercise grounds are to be provided for the physical culture and health of the pupils. Another new departure in the educational line is the sending of fifteen selected cadets to France to pass through five years' military training at the Government expense.

News has come from Rome of an important discovery made during some excavations on the Palatine hill. These excavations were undertaken with a view to ascertaining the position of the entrance of the former Acropolis on the Palatine and exploring the burial ground of the period of the Kings. On April 21 (the traditional birthday of Rome) the excavators came upon a circular ditch, similar to those discovered in the Forum Romanum. As is well known, the Acropolis of the Palatine was in ancient times reserved for the chiefs of the settlement, and the tombs which immediately surrounded it, as far as the second range of walls, were used exclusively by the patrician families. It is believed that the newly discovered ditch is a tomb dating from these earliest habitations, and served as burial place for one of the founders of the settlement. The spot was visited by Signor Rava, the minister of public instruction, who ordered the continuation of the excavations.

The influence of the preceptorial system, introduced at Princeton about a year and a half ago, on the use of the library by the students, is commented on most favorably by Dr. Richardson in his last library report. Books read during the year under the direct influence of the preceptors numbered 16,457 volumes. It was naturally expected that the number of books used for the voluntary and general reading of the students would show a corresponding falling off, but instead of this the record shows an actual increase in such reading. "It was found, in brief," reports Dr. Richardson, "that being in the library for the use of recommended books, tended to get men into the habit of using the other books more freely." Speaking of the specific efforts made at various times in other universities to get students to read the best books, such as the establishment of "professors of books," lectures on books and reading, training in library usage, courses in bibliography, etc., he pronounces them all of little avail, because of a lack of personal influence on the reader.

Statistics of circulation reported by the University of Michigan library for the past year show that 50 per cent. of the books drawn by students belong to the class of English literature. The most popular authors in this class, in the order of their popularity, are as follows: Shakespeare, Hardy, Stevenson, Dickens, Kipling, George Eliot, Jane Austen, and Thackeray. Of books belonging to other classes, the circulation was divided as follows:

	Per cent.
Philosophy and religion	5 3-5
Sociology and economics	5
Education	2
Science	4
Medicine	4
Fine arts and music	1
German literature	5
Romance languages	8 2-5
Latin and Greek	3
History	12

Longmans, Green & Co., have issued in their Pocket Library, the text of Mackail's "Select Epigrams from the Greek Anthology." Would that the number of Americans who could make use of so delightful a book were many times greater.

During his visit to England in 1906, Charles Battell Loomis wrote a series of letters to the New York *Sun*, which have now been brought out in book form, as "A Bath in an English Tub," by A. S. Barnes & Co. Mr. Loomis sees the absurdities of life and relates them with cheerful vivacity.

J. A. Shawyer has prepared for the Clarendon Press, Oxford (Henry Frowde), an edition of Plato's "Menexenus" that should be useful for college students. The work makes no special contribution to scholarship. The text is taken, with due acknowledgment, from Burnet. In a pleasantly written introduction, which has, now and then, the quality of an essay, the author decides for the genuineness of the dialogue, and refutes, somewhat too easily, the idea of Stallbaum and others that Plato did not intend as a wholly serious effort the funeral oration which Socrates learned from Aspasia. The chapter on the growth of oratory and rhetoric might well have been omitted.

Those who have followed recent articles by Prof. Charles A. Briggs on Church Unity and the Roman Catholic Church will not be surprised at his special interest in the decision of the Pontifical Commission adverse to the higher criticism of the Hexateuch. His feeling in regard to the commission's verdict finds expression in his published correspondence with a Catholic layman and Old Testament scholar of liberal views, Baron Friederich von Hügel ("The Papal Commission and the Pentateuch." Longmans, Green & Co). The most significant section of the brochure is Baron von Hügel's endeavor to prove that the church must eventually take the position opposite to that reached by the commission, not only from the weight of critical argument, but also by reason of forces inherent in the church itself. This correspondence is another illustration of the impotency of ecclesiastical authority, whether Protestant or Catholic, to affect the course of critical opinion.

A volume which speaks well for American preaching is "The Invisible Things, and Other Sermons," by J. Sparhawk Jones, minister of Calvary Presbyterian Church, Philadelphia (Longmans, Green & Co.). Dr. Jones's sermons are marked by thoughtful dignity and genuine spiritual appeal, and are equally removed from the commonplace and the sensational. He seems to dwell in a region of quiet religious certainty, above current controversies, and, with Martineau, to conceive of preaching as "essentially a lyric expression of the soul, an utterance of meditation in sorrow, hope, love, and joy, from a representative of the human heart in its divine relations."

In the Johns Hopkins dissertation entitled "The Ancestry of Chaucer" (The Lord Baltimore Press), by Alfred Allan Kern, professor of English in Millsaps College, Mississippi, we have a genealogical study of the great poet executed with the utmost thoroughness and care. No new information of importance on the subject was to be expected, but we have here a critical digest of the "Life Records of Chaucer" (published by the Chaucer Society), and all other sources of our knowledge concerning the poet and his ancestors, with corrections of the inaccuracies which are found even in the best authorities, such as Professor Skeat's "Life," so that the present work may fairly claim to be the best book of reference in regard to the family of Chaucer. The author has, of course, availed himself of V. B. Redstone's researches into the history of the Chaucers in their earlier home of Ipswich, where, in the variable nomenclature of those days, the family had at one time been called Malyn. Professor Kern properly lays stress on the wealth of Chaucer's father, as proved by the records, to explain the early connection of the poet with the court. There can be little doubt, moreover, that he is right in adopting the commonest of the various derivations which have been suggested for the name, Chaucer, viz. Old French *chaucier*, in the sense of "shoemaker." The almost invariable connection of the London Chaucers with Cordwanerstrete Ward strongly supports this etymology. It is expected that the information concerning Chaucer's ancestry, which is summed up in this volume, will soon be supplemented by similar information concerning the family of the poet's wife, Philippa Roet, as a result of the researches in

which Miss K. O. Petersen has latterly been engaged.

The date of the International Historical Congress, to be held at Berlin, has been fixed for the week of August 6 to the 12th. The chancellor of the German Empire will give official notice to all Governments, and ask for the appointment of official representatives. The congress will be divided into eight sections, as follows: History of the Orient, Greece and Rome, Political History of Middle Ages and of Modern Times, Cultural and Intellectual History of the Middle Ages and Modern Times, Legal and Economic History, Church History, History of Arts, Supplementary Branches (Archives and Libraries, Chronology, Diplomacy, Epigraphy, Genealogy, Historical Geography, Heraldics, Numismatics, Palæography). The languages adopted for the congress are: English, French, German, Italian, and Latin. There is to be a general meeting of all sections daily from twelve to two, the remaining hours of the day being kept free for the sessions of the sections. The president of the congress, as well as the several vice-presidents, is to be elected at the first general session. The membership fee will be 20 marks. The committee organized embraces a distinguished group of the members of the faculty of the University of Berlin, with an executive committee consisting of Dr. Reinhold Koser, director of the Prussian archives; Prof. Eduard Meyer, and Dr. Ulrich von Wilamowitz-Moellendorff, together with Dr. Erich Casper as secretary, and Leopold Koppel treasurer.

Under the auspices of the Société préhistorique de France, a third Prehistoric Congress will be held, from August 13 to 18, at Autun, in Burgundy. The two previous Congresses were held at Périguex (1905) and Vannes (1906). Autun is the ancient *Augustodunum* which under Augustus succeeded the Gallic Bibracte as the capital of the Ædui. It is the most important centre in France for the study of primitive camps and fortifications, and this theme will be the first and main topic of the congress. The first three days will be given to the presentation and discussion of papers and to the study of the museums and monuments of Autun, whose early Roman gates (Porte d'Arroux and Porte S. André) and so-called Temple of Janus are exceptionally important. The other three days will be devoted to excursions, particularly to two early Gallic sites of great natural strength and historic interest, Alesia and Bibracte. Alesia (Mont Auxois) is the strong Gallic *oppidum* where the allied Gauls under Vercingetorix made their last stand against Cæsar in this place. It was long since identified by coins of a number of the Gallic tribes, and Capt. Espérandieu has been making further interesting discoveries. As a city Bibracte (Mont Beuvray) was much more important, being the historic capital of the leading tribe of the Ædui, and recognized as the best place for studying the plan and arrangement of a Gallic city, and the industries carried on by the inhabitants. The finds are preserved partly at Autun, partly in the national museum of Saint Germain, near Paris. It is expected that a characteristic specimen of a Gallic house and a section of the ramparts will be uncovered especially for the congress. Dr. Marcel Baudoin (21, Rue Linué, Paris), secretary of the committee of organization, will answer any inquiries and M. Giraux (9bis, Avenue Victor Hugo, Saiut-Mandé, Seine), treasurer, will receive all membership subscriptions, which are 12 fr., including the volume of Comptes-rendus.

Albert H. Smyth, professor of English at the Philadelphia Boys' High School, died last Saturday, in his forty-fifth year. Professor Smyth was curator of the American Philosophical Society, of which Franklin was the founder and which possesses a large number of Franklin MSS. He was thus in particularly good position to carry through the great ten-volume edition of Franklin's works, the last volume of which was only recently published by the Macmillan Company. Professor Smyth was also the author of several other works.

Robert MacLehose, who died recently in Glasgow, was a publisher and printer in the best sense of the word. He was the eldest son of James MacLehose and, after leaving the university, went to work for a year with the Macmillans in London. He then returned to Glasgow, and became a partner of his father in the well-known publishing house. He was also, with his younger brother, printer to the University, and was active in the Publishers' Association. His greatest monument as a publisher is the series of Hakluyt's "Voyages" and Purchas's "Pilgrims," one of the most remarkable reissues of recent years.

Prof. John Kells Ingram, the political economist and follower of August Comte, and author of the ballad "Who Fears to Speak of '98?" or "The Memory of the Dead," died in Dublin on May 1. The work by which he is best known and most likely to be remembered is the above-mentioned ballad, which is fervidly written in the Irish revolutionary spirit. Professor Ingram himself is said to have bitterly regretted writing the poem, and it is not named in the authorized sketches of his life; but the work itself could not be suppressed, and it is to be found in most collections of Irish verse. Professor Ingram, who some years ago held the offices of senior fellow and vice-provost of Trinity College, Dublin, was born in County Donegal, Ireland, in 1823. He was educated at Newry School and Trinity College. He was appointed a junior fellow of Trinity in 1846, professor of oratory and English literature in 1852, regius professor of Greek in 1866, and librarian in 1879. He was a member of the Committee for Publication of Ancient Laws and Institutes of Ireland, a trustee of the National Library in Ireland, and he had been president of the Royal Irish Academy and of the Statistical Society of Ireland. He was also an honorary member of the American Economic Association. Professor Ingram wrote many books, the most popular, perhaps, being "A History of Political Economy," which was translated into nine European languages and Japanese. Among his other books are: "A History of Slavery and Serfdom," 1895; "On the Present Position and Prospects of Political Economy"; "Work and the Workman"; "Outlines of the History of Religion," in which he declared himself a Positivist; "Sonnets and Other Poems," 1900; "Passages from the Letters of Auguste Comte," 1901; "Human Nature and Morals According to Comte," 1901; "Practical Morals," 1904; "The Final Transition," 1905.

WILLIAM STRODE.

The Poetical Works of William Strode (1600-1645). Now first collected from manuscript and printed sources; to which is added "The Floating Island, a Tragi-Comedy," now first reprinted from the original edition of 1655. Edited by Bertram Dobell, with a Memoir of the Author. Published by the Editor.

Mr. Dobell points with becoming pride to his earlier editing of Thomas Traherne's works and to his discovery of James Thomson during that unhappy poet's life. To crown, but not, we hope, to end his labors, he now in one of his beautifully made books gives us the poems of a contemporary of Traherne. The case of the two seventeenth-century writers is, however, not the same. Traherne, until Mr. Dobell discovered his manuscripts, had no name as a poet, so that he stands higher to-day perhaps than in his own lifetime; whereas William Strode was already in his day a considerable personage. The Strodes were an old Devonshire family, and in the early seventeenth century there were five or six Williams, several of whom were men of mark. Our William, the poet, was born in 1600 or 1601, probably at or near Plympton, in Devon. He was educated at Westminster School, and at Christ Church, Oxford, rising to the position of public orator of the university. Most of his life was spent in scholastic circles, where he acquired a reputation for learning and wit. His skill in Latin verse was famous, and his contributions may be found in most of the collections of poems turned out by the university in celebration of important events. He died in 1645.

In religion Strode was a High Churchman, in politics a royalist, a follower in all things of what was orderly and established. If one may judge from his poetical effusions, he was a noble specimen of the old college don, happy in the gentle and respected exercise of all his talents. His play, to be sure—the only one preserved—seems to have fallen somewhat flat. "The Floating Island" was written to order for the celebration of the visit of Charles I. and his queen to Oxford in 1636. Whether the allegory of the piece was too bald, or the moral too severe, does not appear; but the play did not please the court, and was not printed until 1655. To the reader to-day it seems to be an agreeable exercise of its class. The language and versification are dignified, if not brilliant, and the characters, unabashed abstractions of the virtues and vices though they be, have a certain vitality.

But the best of Strode's work is undoubtedly in his lyrics and elegies, as his present editor asserts. Mr. Dobell has gathered these from printed and manuscript anthologies of the day. It has been with him a labor of love; and if his zeal has led him to include one or two poems of doubtful authenticity, or if he has a little exaggerated the value of the poet who may be called his property—who shall be heartless enough

to scold? If we must speak our opinion, it would be that with the exception of one or two poems Strode does not rise above the mediocre, that his work shows the unmistakable signs of the amateur, as indeed may be said of no small part of the Carolinian literature. The fervor of the Elizabethan song had died away; the eloquence of conscious art had not yet been attained, and even the poets celebrated for a few exquisite lyrics stumble and grope uncertainly in most of their work. At his best Strode is of the school of Donne, as in the elegy "On the Death of Mistress Mary Prideaux":

Sleepe pretty one: oh sleepe while I
Sing thee thy latest Lullaby:
And may my song be but as shee,
Nere was sweeter Harmonie:
Thou wert all musicke: all thy limbes
Were but so many well sett hymnes
To prayse thy Maker. In thy browe
I read thy soule, and know not how
To tell which whiter was or smoother,
Or more spotlesse, one or th' other.
Noe jarre, no harshnesse in thee, all
Thy passions were at peace: noe gall,
No rough behaviour; but even such
In disposition as in touch.
Yet Heaven, poore Soule, was harsh to thee:
Death usde thee not halfe orderly:
If thou must needs goe, must thy way
Needs be by torture? must thy Day
Ende in the Morning? and thy Night
Come with such horrour and affright?
Death might have ceizd thee gentlyer, and
Embrac'te thee with a softer hand.
Thou werte not sure so loath to goe
That thou needst be dragged so.
For thou wert all obedience, and hadst witt
To doe Heaven's will and not dispute with it.

There can be no mistake in regard to the origin of this style; Donne in his elegy to Elizabeth Drury taught the new generation of poets—and Strode with the rest of them—their lesson, but he could not transmit to them his strange flashes of almost unearthly beauty. The difference may be seen by comparing Strode's lines,

All thy limbes
Were but so many well sett hymnes, etc.,

with their counterpart in Donne:

We understood
Her by her sight; her pure and eloquent blood
Spoke in her cheeks, and so distinctly wrought
That one might almost say her body thought.

This is not an arbitrary comparison, but might be paralleled by a hundred passages which would show what we mean by calling Strode an amateur.

Perhaps the point is brought out most clearly by those poems, hitherto ascribed to more famous names, which Mr. Dobell now claims for his protégé. One of these is the well-known lines on "Melancholy" which have always been associated with Fletcher. It must be confessed that direct evidence, as with many another favorite Elizabethan lyric, is conspicuously weak. The verses occur in the play of "The Nice Valor," which is only partly Fletcher's, and furthermore it was a pretty common practice to insert lyrics from various sources. Now there is no manuscript authority for ascribing the poem to Fletcher, whereas Mr. Dobell asserts that to his knowledge it is in three early manuscripts given to Strode. There is, too, a positive statement of Malone's, on what grounds does not appear, that Strode and not Fletcher was the author. So far the evidence lies rather strongly for Strode. Mr. Dobell prints the poem together with an "Opposite to Melancholy" which answers the "Melancholy" in the well-known Elizabethan and Carolinian manner. Now the suggestion immediately arises that, the "Opposite" being undoubtedly Strode's, the manuscript anthologies ascribed its companion piece, "Melancholy," to the same author by natural inference rather than through knowledge. And a glance at the two poems themselves renders this explanation almost proved. Strode's lines we may give in full:

OPPOSITE TO MELANCHOLY.

Returne my joyes, and hither hriug
A tongue not made to speake hut sing,
A jolly spleene, an inward feast,
A causelesse laugh without a jest,
A face which gladnesse doth anoynt,
An arm that springs out of his joynt,
A sprightfull gate that leaves uo print,
And makes a feather of a flint,
A heart that's lighter than the ayre,
An eye still daneing in his spheare,
Strong mirth which nothing can controule,
A body nimbler than the soule,
Free wandring thoughts not tyde to muse
Which thinke on all things, nothing choose,
Which ere we see them come are gone;
These life itselfe doth feede upon.

Now, these lines certainly show wit and fluency, but compare them with a verse or two of the original "Melancholy":

Welcome folded arms and fixèd eyes,
A sigh that piercing mortifies,
A look that's fasten'd to the ground,
A tongue chain'd up without a sound;
Fountain heads and pathless groves,
Places which pale Passion loves, etc.

Here is a something, a transmutation of fancy, which Strode's "Opposite" does not possess, and which incline us to believe that he could not have written the "Melancholy."

Another case of the same kind is the attribution to Strode of the lines "On the Life of Man," commonly attributed to Raleigh:

What is our life? a play of passion;
Our mirth the musick of division:
Our mother's wombes the tyring houses hee
Where wee are drest for tyme's short comedy:
The earth's the stage, heaven the spectator is.
Who marketh still whoere doth act amisse:
Our graves that hide us from the burning sunne
Are but drawne curtaynes when the play is done.

Here, again, there is a certain magic of the imagination which, in our opinion, sets the poem off from even the best of Strode's work.

But all this is not to deny to Mr. Dobell the warmest gratitude for recovering a poet so long forgotten, nor would it refuse to Strode's works qualities of genuine interest historically and intrinsically. To many readers there is a peculiar attraction in a book of this kind, which reflects with talent and distinction, though it may be without great genius, the quiet and refined life of a scholarly gentleman of a past age. And this young orator of Oxford (he was only forty-five when he died, although one naturally thinks of the man as aged, by the antiquity of his century) struck at times a pretty, lyrical vein, as witness this "Song":

When Orpheus swèctly did complayne
Upon his lute with heavy strayne
How his Euridiee was slayne,
The trees to heare
Obtayn'd an eare,
And after left it off againe.

At every stroake and every stay
The boughs kept time, and nodding lay,
And listened bending all one way:
The aspen tree
As well as hee
Begau to shake and learn'd to play.

If wood could speake, a tree might heare,
If wood could sound true grelfe so neare
A tree might dropp an amber teare:
If wood so well
Could ring a knell
The Cipres might condole the heare.

The standing nobles of the grove
Hearing dead wood so speak and move
The fatall axe beganne to love:
They envyde death
That gave such breath
As men alive doe saints above.

CURRENT FICTION.

Through the Eye of the Needle. By W. D. Howells. New York: Harper & Brothers.

Like his previous book upon Altruria, Mr. Howells's present story establishes beyond question his sincerity in framing this model community, as an outcome of the appeal of our unsatisfactory conditions to his own soul. Clear proof of this lies in the resemblance between Altruria, Mr. Wells's comet-struck world, the country Mr. Beliamy saw in "Looking Backward," Utopia, and the Republic of Plato. Each one of these is far too like the other to be a plagiarism, and Mr. Howells's island differs from the rest only by a few unimportant details. In Utopia "they bringe up verye fewe horses." The horse likewise enjoys small favor in Altruria. In Utopian cities "whoso knoweth one of them knoweth them all." In Altruria "the villages are a good deal alike to a stranger." All these philosophers believe in discarding money, in putting every one to light, pleasant labor, in benevolent sumptuary laws, in equalizing ability, talent, and disposition.

Glaucon objected to Socrates: "If you had been establishing a city of pigs, is this not just what you would have fed them on?" Mr. Howells's people thrive on a diet of vegetables, fruit, and mushrooms, without even a sip of Plato's wine, much less a taste of Sir Thomas More's carefully slaughtered beeves. Modern hygiene (sanitary cheek-kisses only, in Altruria!) of course prevails, and malefactors are comfortably bagged in a harmless electric net. No one has any worries, no one is in a hurry; in fact, the whole picture again enforces the trite observation that it is simpler to destroy than to create, that even for Swift himself it was easier to sting with satire than to move our feelings with a bland picture of perfection (witness the superiority of Laputa to the average model island).

The story itself, considered purely as fiction, is inevitably subordinate to questions of ethics and economics. Revisiting New York after a lapse of years, Mr. Homos of Altruria notes in letters home the various changes which meet his eye, or which he learns through that method of intelligent inquiry dear alike to Socrates and to Rollo. His description of the Makelys is as appalling as it is unanswerable—the ultra docile American husband, thoroughly apartment broke, and his aridly selfish wife eternally chattering and gadding, yet too lazy to concern herself with any detail of domesticity. This lady strikes the note of her entire character when she delivers her ultimatum: "And I told Mr. Makely that I would rather live in a house all my days than in any flat where my dog wasn't as welcome as I." Apart from this couple, who are even painfully lifelike, the other personages are decidedly shadowy. There is a positively phantom courtship between

Mr. Homos and Eveleth Strange, in which the only obstacle turns out to be the lady's inherited trait of associating the idea of interest with capital. This obstacle naturally vanishes in due time, and when a large sea-going yacht is stranded upon the Altrurian shore, the arrogant attitude of its owners proves as trying to the new Mrs. Homos as to the oldest inhabitant. The account of these plutocrats endeavoring to maintain the forms of an obsolete social order verges perilously upon comic opera, and the way in which their butler carries off the honors obstinately suggests Mr. Gillette's late success in "The Admirable Crichton."

All this, however, is of small consequence, the point of interest being that with Mr. Howells's deep love of humanity as he finds it, the apostle of realism in American fiction should care to spend (almost waste) his precious gifts upon such a toy of the imagination as the island of Altruria. The mere fact that he should do so is of far greater significance than the achievement itself; although in explaining New York, Mr. Homos affords opportunity for Mr. Howells to make sound and valuable comments on the passing hour. His version of the evolution of the apartment house, the expected rehabilitation of the baby (whose passing he noted in 1894), of the approaching solution of the servant question, and of the public disposition towards the overrich in New York to-day, shows a fine spirit of optimism. And if these changes have as yet only been signalled in the innermost circles, it is certainly consoling for people far afield to learn that the difference between New York and Altruria promises shortly to become merely one of degree.

The Golden Hawk. By Edith Rickert. New York: The Baker & Taylor Co.

In her latest book Miss Rickert tries her wings in yet another direction. "The Reaper" was a grim, apparently faithful study of peasant life on a hard wind-blown coast, the Shetland Islands; a powerful story with more frost than sunshine, more trouble than happiness. In "Folly" she gave a more or less interesting picture of an exceedingly ill-regulated young woman (of the fashionable world) of that kind with whom it is a toss up whether the outlet for her nerves will be neurastbenia or lovers. In "The Golden Hawk" Miss Rickert goes back to the country, but to a sun-baked Provençal village full of good things to eat, of impulses and mirage. The rather painful strength of her Shetland story is here toned down to an agreeable robustness, and she escapes the danger of letting her picaresque hero seem hackneyed and mediocre, by tracing his mental processes from within out, here and there giving a genuine touch of character study, instead of relying entirely upon description of his fantastic dress and twinkling hawk-like eyes. She leaves you as undecided as his fellow townsmen whether Trillon were more mad than sane, more shrewd than foolish; but what she fully understands is the way in which the impulses of such light-hearted beings ebb and flow, their uncertain gusts of enthusiasm and satiety, and the dangerous moments when a rift of doubt threatens to crumble the entire edifice of their immense self esteem. If not quite so delicate a creation as Mr. Locke's incomparable Paragot, Trillon at least belongs to the same care-free brotherhood of grown-up children, with the knack of making mirage come true, with the same desire to *épater le bourgeois.*

The history of his courtship is worked out with sufficient ingenuity and invention to keep up a pleasant suspense as to the end, while never depriving you of the assurance that it will end well, or quite as well as is plausible when a will-o-the-wisp undertakes the responsibilities of citizenship. True, in Trillon's case, Miss Rickert wisely settles him down as citizen of the world at large, and thus avoids leaving behind an uncomfortable sense that her Golden Hawk has been caged.

The Long Trail. By Hamlin Garland. New York: Harper & Brothers.

This is a boys' book. If it be scarcely so dangerously fascinating as to lure home-keeping lads into the Klondike by a difficult and untravelled road, parents and guardians will hardly quarrel with it on that account. Also they will fully approve its tone of manliness, decency, and respect for law. Jack is polite to strangers, considerate to Indians, and merciful to animals, and the straightforward narrative of his venture is by no means uninteresting.

It is never possible exactly to foresee what will hold the attention of children just a shade too old to "play Indians," yet by no means too old to indulge in day dreams about themselves as heroes of adventure. It is perfectly safe, however, to say that if "The Long Trail" does prove to contain the quality which tickles youthful palates, it may be given to the young without a shade of misgiving as to their finding it entirely wholesome provender.

Documentary History of Reconstruction: Political, Military, Social, Religious, Educational and Industrial, 1865 to the Present Time. By Walter L. Fleming. 2 vols. Cleveland: The Arthur H. Clark Co. $10.

It is quite possible that Professor Fleming, young as he is, knows more of the specific facts of Reconstruction than any other scholar in the country. If he has kept in his mind the half of the great mass of miscellaneous information which he printed in his prodigious monograph on Reconstruction in Alabama, he certainly knows more than any one else does about the process in any particular State.

Apart from this advantage, the outcome of patient industry, he has also what students of the period generally concede to be the decided advantage of being a Southerner. As he remarks in the general preface to this, his second voluminous contribution to the history of Reconstruction: "All who have done work in Southern history know of the exasperating difficulties in the way of the use of documents which are in the hands of private individuals." But a Southerner, in sympathy with the historical attitudes of his own people, has a far better chance to overcome those difficulties than a Northerner; and there are signs enough in the Alabama monograph that residence in the North, and the training of a Northern university, have not weakened Professor Fleming's sympathy with the Southern attitude towards "carpet baggers," "scalawags," and "renegades." That, however, is an attitude far more common in the North than it used to be. One could find it in one's heart to forgive Professor Fleming his apparently strong Southern bias, so colorlessly impartial is much history work nowadays; impartial, that is, in the sense of being woodenly neither-sided, rather than sympathetically, imaginatively both-sided. One could forgive him, we say, if he only exhibited a compensating freedom from the commoner limitations of the laborious school to which he belongs; if, for instance he presented agreeably the results of his industry. But neither the Alabama monograph nor his own contribution of introductions and explanations in the work before us indicates that he has such a gift. Like so many others, he succeeds better as a delver for historical material than as a writer of history. Not unlikely, his true vocation is to such work as went to the making of these volumes.

The making of them began with the collecting, and the printing in leaflet form, of various documents about Reconstruction which were not otherwise readily accessible. These were apparently intended chiefly for class-room use; and we think the volumes in their final form bear the marks of a class-room origin. They are not a collection of whole documents, like Edward McPherson's misnamed "History of Reconstruction." We have, rather, a series of extracts from documents, few of which are given in full. The collection will not, therefore, take the place of McPherson's, which students of Reconstruction find quite indispensable, and which has become extremely rare. But the exracts in Volume i., aided by the author's brief introductory statements, illustrate fairly well all the steps in both Presidential and Congressional Recoustruction, while Volume ii. deals carefully with the results of the Congressional plan.

Professor Fleming's citations are particularly full in regard to the social conditions and the state of public opinion in the South after the war. He has brought them together from many sources, neglectiug none known to the mass of scholars. They would make, one sees at once, an admirable course of "required reading," to be taken with a course of lectures following the same elaborate topical-chronological arrangement. As material for independent study and research, however, they would prove less satisfying. For that use, McPherson's *omnium gatherum* plan is probably better. It is decidedly unsatisfying, for instance, to find less than the whole of such documents as the reports of Carl Schurz and B. C. Truman on conditions at the South in the autumn of 1865. Not even the Reconstruction part of Lincoln's last public speech is given entire. More annoying still, and we think still less defensible, is the practice of deleting parts of sentences. To condone it, one must have the utmost confidence in the editorial discretion as well as the editorial honesty.

The matter which is found in Professor Fleming's work, and not in McPherson's gives a fair idea of the increase of material concerning Reconstruction since the

end of the Reconstruction period. Naturally, few of the more recent additions are in the form of public documents. Some are taken from printed books, but Professor Fleming has drawn more largely from manuscript sources. The most important single source of fresh material is the manuscript correspondence of Andrew Johnson, now in the Library of Congress. In that collection are the originals of a particularly interesting group of papers—letters from various leaders of the fallen Confederacy, describing the situation created by the failure of their enterprise. There also are letters from anti-slavery men like Chase and Gerrit Smith, giving their view of the President's proper policy. But Professor Fleming has also thought that thoroughness demanded a freer use of certain classes of official documents than most editors would make. He is careful to exhibit in that way the actual working of military government in the South, and the agencies by which three successive sets of State governments were put in operation. He also prints more of the laws commonly called the "Black Codes" than we remember to have seen together anywhere else.

In volume ii., however, the official document occupies but little space; the material used to illustrate the carpet-bag régime is, as a rule, of a more readable character. It is in this part of Professor Fleming's work that his familiarity with the facts and with the scattered and various literature of the period serves him best. He has searched patiently through books of reminiscence, newspapers, and private diaries and letters for citations which, read in their order, bring before the mind a fairly clear and fairly complete picture of the oppressed South during those gloomy years. An editorial animus is, we think, perceptible. For instance, we think too much is made of the Southern sentiment favorable to schools for the blacks. A Northern editor would probably have given more instances of Southern Bourbonism, and taken more pains to let it be seen that not all carpet-baggers were scoundrels. But there is no good reason to doubt the truth of the general inference one draws from what one reads. It accords too well with the verdict of J. F. Rhodes, the latest, most thorough, and most judicial historian of the period.

Fortunately, the final overthrow of the carpet-baggers was so complete, the undoing of Reconstruction has been so thorough, and the South's recovery from its cruel consequences has been so rapid, that it is pardonable to accept what relief one finds in the humorous aspects of the picture. To these Professor Fleming has not been blind, and he could not, if he would, have obscured them entirely. He could hardly, for instance, have left out the diverting documents which set forth the "legislative expenses" of South Carolina under her unequalled carpet-bag and negro Legislature. Were there ever, before or since, in the history of representative government, such items as these: "4 dressing combs," "1 stereoscope," "1 pair corsets," alongside an intolerable deal of sack—set down among the necessary expenses of law-making? Hardly less ludicrous is the light which some of the witnesses before Congressional committees threw upon the actual working out of the theories which Charles Sumner so imperiously refused to adapt to the actual conditions of a great and perplexing human problem.

Studies in Humanism. By F. C. S. Schiller. New York: The Macmillan Co. $3.25 net.

In these studies Mr. Schiller expounds and defends from several points of view the pragmatism, or humanism, of which he is the foremost British representative. He has been so bitterly criticised by the Anglo-Hegelians, particularly by Mr. Bradley, that it is not strange that he should show petulance and acerbity in his replies. Pragmatism has made rapid progress since the publication of Charles S. Peirce's earlier essays, and it has been made popular by the writings of Prof. William James as well as by Mr. Schiller's former treatise on "Humanism." The theory has spread in France and Italy as well as in the United States and Great Britain, although in Germany its success has not been remarkable. It has checked the advance of those doctrines of the absolute which had found special favor at Oxford, and it has been welcomed by certain empirical philosophers who had been stumbling about in the uncertainties of skepticism. We doubt, however, whether these "Studies" will produce much impression upon those whom Mr. Schiller's earlier treatise failed to convince.

Among the essays which make up this large volume several are unworthy of so permanent a place. This is especially true of the fourth, entitled "Truth and Mr. Bradley," which presents little that is either interesting or valuable; and which can be read intelligently only by those who are already familiar with the disputes of these rival Oxford philosophers. Essays XIV. and XV. are rather sorry imitations of Platonic dialogues, and the book would be better had they been omitted, for the author's wit and dramatic talent are not such as to do justice to this form of philosophical exposition. Objection might also be made to the playful style and ill-timed quips which characterize some of the chapters. So much has been said of the dryness and dreariness of works on philosophy that certain writers are tempted to go to the opposite extreme. In this case such expressions are the less necessary inasmuch as Mr. Schiller's polemic against the Oxford Hegelians and their sympathizers is very effective, particularly in those passages which show the futility of the absolute as a theoretical and as a practical principle.

The first essay, on "The Definition of Pragmatism and Humanism," is a restatement and defence of the principle underlying what its advocates proudly call "the new philosophy." The author challenges "the intellectualists" to define truth; and then defines it himself, showing how it is to be tested. In answer to Mr. Schiller's challenge, it might be said that all definitions of truth as anything objective are invalid, and indeed absurd; for truth is altogether relative to a mind which assents. Nor is the intellectualist to be blamed for his failure to give a definition, any more than is the author for using without definition such terms as "assent," "belief," "assumption," "volitional activity." When he calls belief "an attitude of the will," and opposes voluntarism to intellectualism, the terms employed have in them so much of the old "faculty psychology" that one hesitates in describing pragmatism as "the new philosophy." And it would appear that a clear definition and analysis of what is meant by "will" was absolutely essential to a valid presentation of humanism.

The fundamental point of difference between the pragmatists and their opponents is that which concerns the test of truth; yet the more careful and painstaking Mr. Schiller is in explaining the pragmatic doctrine, the more elusive and unsatisfactory must this doctrine appear to his critics. The pragmatist says virtually: If a proposition has value, if it will work, it is to be accepted as true. If later on it it be found to be valueless, it may be abandoned; but *pro tempore*, if valuable, it is true. The answer made to this is that pragmatism thus destroys the distinction between truth and value. For if the true be merely the valuable, to say that the test of truth is its value is to make the tautologous assertion either that the true is the true or that the valuable is the valuable. You reduce your universe to a universe of values or utilities, or at the most you have an indeterminate universe, affirmations concerning which may or may not turn out to have value. If asked whether it be indeed true that value is the test of truth, the pragmatist must reply that "value is the test of truth," but that this latter statement is true because it has value. According to such principles, argument by word, whether written or spoken, seems to the anti-pragmatist to be idle. Assent to any proposition must be withheld until it has been tested by action; and action takes the place of logical procedure. If this conclusion be rejected, the anti-pragmatist must still inquire how "value" is to be determined. If "intellectualism" has to be banished while we are testing truth, it must be reintroduced while we are determining value. This is clearly illustrated in Mr. Schiller's discussions, particularly in Essays XI. and XII. The arguments in defence of his position imply a purely intellectual assent. They have indeed a logical value, by which is meant that they are intellectually true, or are rationally deduced from what produces assent. That is not to say that they have a pragmatic value.

Mr. Schiller's discussion of "Freedom" in Essay XVIII. should have been one of the most interesting in the book. In settling the question at issue between determinism and its opposite, the pragmatic method might be supposed to have a peculiar value. For, indeed, the popular way of settling it has always been pragmatic. The common saying is: "Whether the will be free or not, we have to act as if freedom were a fact." Mr. Schiller has, however, impaired the clearness of his exposition as well as the force of his argument, by certain misconceptions or misstatements, only a few of which we can here point out. 1. He confuses the necessary sequence of causes and effects with the uniformity of nature; 2. He apparently fails to perceive that commands or persuasions may be elements in determining volitions; 3. He assumes that determinists act as if their wills were undetermined, which as a matter of fact is not the case; and. 4. He assumes that we have an imme-

diate consciousness of freedom—an assumption which will not bear close investigation.

These "Studies" will be interesting to readers of every variety or philosophical opinion; and even those who do not agree with the author will always find him suggestive.

The Desert and the Sown. By Gertrude Lowthian Bell. Pp. xvi., 347. New York: E. P. Dutton & Co. 1907. $5 net.

To all who feel the call of the East this book is full of fascination, from the Omar Khayyám title to the parting of Mikhāil and the lady on the last page. While the object of the book is not archæology, Miss Bell is yet a keen and well-trained observer, and one who has read most that is worth reading on Syrian antiquities and art, and her incidental notices of places visited are often valuable to the archæologist. Her map of Syria and many of her illustrations also are of much interest archæologically—little fragments of architectural decoration, curious doorways and façades, quaint capitals from almost unheard-of sites and the like. Other illustrations reveal the costumes and physiognomy of the people, their homes, and customs. The frontispiece is a colored plate of John Sargent's "Bedouins of the Syrian Desert."

The object of the book, or, as the author puts it, the specious and plausible excuse for its existence, is that she "desired to write not so much a book of travel as an account of the people whom I met or who accompanied me on my way, and to show what the world is like in which they live, and how it appears to them." And in this she has eminently succeeded. Familiar from childhood with the language of the people, their customs, and habits, Miss Bell possesses also that keen sympathy with their point of view, that interest in themselves and their doings, without which it is impossible for any one, however familiar with the language or the country, to enter into the very life of the people. To her they laid bare their hearts; and those who have struck her trail report that the Druzes and the Bedouin especially love her and trust her in a way that is most singular. She is a rare combination of the thoroughly feminine woman and the fearless, daring, and resourceful English traveller. How she was able to go where she did, one woman entirely alone among men, is her own secret; but she certainly contrived to do it without losing her feminine charm or her feminine point of view.
